Energy Research Abstracts

Abstracts 14706-17442

Office of Scientific and Technical Information
UNITED STATES DEPARTMENT OF ENERGY

The Office of Scientific and Technical Information

The Office of Scientific and Technical Information (OSTI) in Oak Ridge, Tennessee, provides direction for the Department of Energy's scientific and technical information (STI) program and maintains a centralized base of support to assist Departmental elements in planning, developing, and implementing STI activities. DOE-originated and worldwide literature and software on advances in subjects of interest to DOE researchers are collected, processed, and disseminated using computerized databases, publications, and other media.

This information collection, containing over three million citations, represents a major national resource of scientific and technical information. In addition to information from DOE and its contractors, DOE acquires information through its international partnerships with the International Energy Agency's Energy Technology Data Exchange (ETDE), a consortium comprised of members from North America and Europe, Japan and Korea; the International Atomic Energy Agency's International Nuclear Information System, representing 80 countries; bilateral agreements with foreign governments; exchange agreements with other U.S. government agencies; and contracts with private information organizations and professional societies.

The subject scope of this information extends beyond energy, covering basic scientific studies in such areas as radiology, atomic and nuclear physics, radiation and nuclear chemistry, superconductivity, supercomputers, the environment, health and safety, waste management, nuclear medicine, and arms control.

Major DOE databases are available within the United States through DIALOG Information Services and STN International and outside the United States through formal governmental exchange agreements. DOE and DOE contractor offices can access the databases online through the Integrated Technical Information System (ITIS) maintained by OSTI.

Energy Research Abstracts

Coverage

Energy Research Abstracts (ERA) provides abstracting and indexing coverage of all scientific and technical reports and patent applications originated by the U.S. Department of Energy, its laboratories, energy centers, and contractors, as well as theses and conference papers and proceedings issued by these organizations in report form. Audiovisual materials, computer media (magnetic tapes, diskettes, etc.), and engineering drawings are included in this definition. *ERA* also covers other energy information prepared *in report form* by federal and state government organizations, foreign governments, and domestic and foreign universities and research organizations, *provided* that the full text of the document has been received by OSTI. Foreign report information is obtained through the International Energy Agency's 18-nation Energy Technology Data Exchange, the International Atomic Energy Agency's International Nuclear Information System, or nation-to-nation agreements. The purpose of this publication is to announce documents produced or obtained by DOE that are not so readily available as journal articles, books, or patents.

Scope

The scope of *ERA* encompasses DOE's research, development, demonstration, and technology programs resulting from its broad charter for energy sources, supplies, safety, environmental impacts, and regulation.

The citations presented in *ERA* are available for online searching as records within the Energy Science and Technology Database (EDB). The current-year records are available on the Integrated Technical Information System (ITIS).

Availability

DOE and DOE contractors can obtain *ERA* (regular issues and annual indexes) by using VISA, MasterCard, or OSTI deposit accounts. Contact the Office of Scientific and Technical Information, P.O. Box 62, Oak Ridge, TN 37831, Attention: Information Services. For further information, call (615)576-8401. *ERA* is also available at authorized GPO Depository Libraries. (List is provided on the inside back cover.)

ERA (regular issues and annual indexes) is available to the public on a subscription basis from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Managing Editor, Leota S. Kane
Technical Editor, Barry C. Steele

Information Sources

The citations presented in *Energy Research Abstracts* are a subset of the worldwide energy information provided to the Office of Scientific and Technical Information (OSTI) through exchange agreements with foreign sources and through exchanges or contracts with U.S. organizations.

The **Energy Technology Data Exchange (ETDE)** was established by the International Energy Agency to promote cooperation among members in conducting appropriate energy-related research and development programs through the development of a formal central information sharing system. In accomplishing the objectives of the ETDE, members select, abstract, and index relevant research information published in their countries in accordance with Exchange standards. OSTI serves as the central receiving and processing center for this information, which it then disseminates to national centers in the participating countries. The following countries are currently members of the ETDE:

Australia	Norway
Brazil	Poland
Canada	Republic of Korea
Denmark	Spain
Finland	Sweden
France	Switzerland
Germany	The Netherlands
Italy	United Kingdom
Japan	United States

The **International Nuclear Information System (INIS)** was established to promote the exchange of information on nuclear science and technology. Its operation is similar to that of the ETDE, with the INIS Secretariat being located in Vienna, Austria. Currently, 79 countries and 15 international organizations are members of INIS. OSTI serves as the INIS national center for the United States.

In the exercise of its rights and responsibilities under the agreements to which it is a party, the **Office of Scientific and Technical Information** both receives information from the above sources and submits U.S.-produced information to them. In addition to materials generated by the Department of Energy, this U.S.-produced information is gathered from other government agencies as well as under contract with private information processing companies. All input is computer processed and entered into a database for online retrieval. The database serves as well for the production of numerous OSTI publications.

How To Read A Citation

The principal data elements included in these citations are:

1. **Abstract number** within volume.
2. **Report number** identification for report-type literature.
3. **Title and subtitle** (non-English title may appear in parentheses, if applicable).
4. **Author(s).** First 10 names in the data record are printed, then "et al." is listed.
5. **Author affiliation.** Only first one is listed, in parentheses after author(s) to which it applies.
6. **Collaboration,** if present.
7. **Corporate author(s)** identifying corporation responsible for document.
8. **Date of publication.** If not known, a processing date is in brackets.
9. **Number of pages** or page range. Prices are based on total pages unless special pricing applies.
10. **Language** of document if non-English.
11. **Monograph title** if citation is an analytic (part, chapter, or paper) of a larger monograph.
12. **Sponsoring organization.**
13. **Contract or grant number.**
14. **Secondary identifying number;** may be a conference number.
15. **Conference title, location, and date,** if applicable.
16. **Order number.** The "DE" order number may be used for ordering from NTIS or OSTI, as appropriate. The "TI" prefix is valid only at OSTI.
17. **Sources of availability** from which a copy of the document may be obtained; usually appear as abbreviations. (See information on following page.)
18. **Drop note** or explanatory statement.
19. **Abstract.**
20. **Subject descriptors.** Listed only if no abstract or only a brief statement is included.

Canada Mortgage and Housing Corp., Ottawa, ON (Canada). 1990. (CONF-900724-Vol.1: Indoor Air '90: 5th international conference on indoor air quality and climate, Toronto (Canada), 29 Jul - 3 aug 1990). In Indoor air '90: The fifth international conference on indoor air quality and climate. Volume 1: Final report. 786p. Order Number DE90017786. Source: NTIS.

Air pollution in houses caused by combustion of coal is more serious than that by combustion of natural gas and methane (primarily by SO_2 and NO_2). The gas concentration after cooking is higher than that before cooking, and it is higher in kitchen than in bedroom and outdoor. There were mutations in the extract from TSP in 30m^2 air in the bedroom, kitchen and outdoor, where coal and natural gas were used. The supernatant saliva activity of children whose family uses coal is significantly lower than that of pumping streams.

How To Order from the Availability Sources

TO OBTAIN A REPORT

Report literature, usually identified by an alphanumeric identifier at the beginning of a citation, is available from the sources listed in the citation (see example of element 2 on page iii). Often the sources are listed as abbreviations. Corresponding addresses are provided at right from which documents with these abbreviations may be ordered. When "OSTI" is given, **DOE and DOE contractors may order these documents from OSTI.** (However, check with your library or information organization which may require that orders go through them to OSTI.) OSTI prices are based on total pages unless special pricing applies. The public should order from NTIS or from one of the other agencies listed in the citation. NTIS price codes may continue to appear in some records. To expedite processing, an order form is provided in the back of this publication. NOTE: The order numbers provide quicker access for report ordering. Use the order number where possible.

How To Use the Indexes

Five indexes are provided for approaching the content of each issue of *Energy Research Abstracts*. Descriptions of entries in these indexes follow.

Corporate Author Index
The corporation, organization, or institution responsible for the issuance of the document is listed in this index. The entries are arranged alphabetically and provide the title and citation number of the reference. For example, the listing for the "Report" sample citation would appear as shown at right.

Wisconsin Univ., Madison (USA). Dept. of Physics
[Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)
Wisconsin Univ., Madison (USA). Lab. of Genetics
Organization of the R chromosome region in maize: Final progress report, June 1, 1983–May 31, 1986, 15:18255 (R;US)

Personal Author Index
Each author's name listed on a document cited in this issue is indexed. An index entry provides title and citation number; for secondary and other names, a cross-reference is given to the primary author name where the full index entry is located.

Hadley, D.L., *See* Lee, A.D., 15:17651
Haeberli, W., [Development of a hydrogen and deuterium polarized gas target for application in storage rings]: Progress report, 15:18494 (R;US)

Subject Index
This index lists the main subject descriptors assigned to each record by indexing professionals. A secondary or qualifier term is used where necessary to describe materials, objects, and processes. Document titles may be enhanced with additional informative phrases where necessary. An excerpt from this index appears at right.

HYDROGEN ISOTOPES
See also DEUTERIUM
HYDROGEN 4
TRITIUM
Neutron-Rich Isotopes
Study on the strong neutron-rich nuclei of lightest elements, 15:18686 (RA;SU;In Russian)

Contract Number Index
DOE technical reports are listed by contract number. Each entry also provides the primary corporation or organization cited for that contract number. A typical entry is shown.

FG02-88ER40438 **Wisconsin Univ., Madison (USA). Dept. of Physics**
15:18494 DOE/ER/40438–T1
FG02-88ER60664 **Rogers and Associates Engineering Corp., Salt Lake City, UT (USA)**

Report Number Index
Technical report literature is indexed by the alphanumerical identifier of the report. Patent documents and conferences are included for convenience. Each entry lists the citation number, the source of availability of the document, an indicator of presence at a GPO depository library, order number, and distribution category. A typical entry is:

DOE/ER/40438–T1 15:18494 NTIS, OSTI E 1.99: DE89007246 MF-411

Subject Contents

The subject content of *Energy Research Abstracts* is arranged as shown below. The two-digit and four-digit category numbers printed here illustrate the category number assignment used in the database records.* The following list includes all of the 38 first-level and the 313 second-level categories. Because each issue of *ERA* publishes citations only for those documents announced during the past semimonthly period, some subject categories may not be present in every issue.

Numerical Listing of Categories

01 COAL LIGNITE, AND PEAT
- 03 Preparation
- 04 Processing
- 05 Products and By-Products
- 06 Properties and Composition
- 08 Waste Management
- 09 Environmental Aspects
- 10 Reserves, Geology, and Exploration

Energy Research Abstracts

01 COAL, LIGNITE, AND PEAT

0103 Preparation

Refer also to citation(s) 14726, 14749

14706 (DOE/PC/88881–T24) **Engineering development of advanced physical fine coal cleaning technologies - froth flotation. Quarterly technical progress report No. 23, April 1, 1994–June 30, 1994.** ICF Kaiser Engineers, Inc., Pittsburgh, PA (United States). [1995]. 188p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88PC88881. Order Number DE95009345. Source: OSTI; NTIS; GPO Dep.

A study conducted by Pittsburgh Energy Technology Center of sulfur emissions from about 1,300 United States coal-fired utility boilers indicated that half of the emissions were the result of burning coals having greater than 1.2 pounds of SO_2 per million BTU. This was mainly attributed to the high pyritic sulfur content of the boiler fuel. A significant reduction in SO_2 emissions could be accomplished by removing the pyrite from the coals by advanced physical fine coal cleaning. An engineering development project was prepared to build upon the basic research effort conducted under a solicitation for research into Fine Coal Surface Control. The engineering development project is intended to use general plant design knowledge and conceptualize a plant to utilize advanced froth flotation technology to process coal and produce a product having maximum practical pyritic sulfur reduction consistent with maximum practical BTU recovery.

14707 (DOE/PC/89663–T15) **Development of a coal quality expert. Technical progress report No. 17, April 1994–June 1994.** CQ, Inc., Homer City, PA (United States). 5 Oct 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-90PC89663. Order Number DE95009354. Source: OSTI; NTIS; GPO Dep.

The work falls under DOE's Clean Coal Technology Program category of 'Advanced Coal Cleaning.' The 51-month project will provide the utility industry with a PC software program to evaluate the potential for coal cleaning, blending, and switching options to reduce emissions while producing electricity.

14708 (DOE/PC/90311–T3) **Characterization of multiphase fluid flow during air-sparged hydrocyclone flotation by x-ray CT. Final report, 14 August 1990–13 August 1994.** Miller, J.D. Utah Univ., Salt Lake City, UT (United States). 18 Oct 1994. 210p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90311. Order Number DE95005661. Source: OSTI; NTIS; GPO Dep.

Air sparged hydrocyclone (ASH) flotation is a new particle separation technology that has been developed at the University of Utah. This technology combines froth flotation principles with the flow characteristics of a hydrocyclone such that the ASH system can perform flotation separations in less than a second. This feature provides the ASH with a high specific capacity, 100 to 600 times greater than the specific capacity of conventional flotation machines. In an effort to develop a more detailed understanding of ASH flotation, multiphase flow characteristics of the air sparged hydrocyclone were studied and the relationship of these characteristics with flotation performance was investigated. This investigation was divided into four phases. In the first phase, the time-averaged multiphase flow characteristics of the ASH during its steady state operation were studied using x-ray computed tomography (x-ray CT). In this regard, a model system, mono-sized quartz flotation with dodecyl amine as collector, using a 2 in. diameter ASH unit (ASH-2C), was selected for study. Various flow regimes, namely, the air core, the froth phase, and the swirl layer, were identified and their spatial extent established for different experimental conditions by x-ray CT analysis. In the second phase, a detailed parametric study of flotation response of the ASH for the same system was carried out in order to establish the effect of various operating variables on flotation response. The findings of this phase of investigation were then correlated with the multiphase flow characteristics as revealed by x-ray CT in the first phase. Thus, the impact of various operating variables on the flow regimes, and hence, on flotation response was established.

14709 (DOE/PC/92206–T8) **Bench-scale testing of the micronized magnetite process. Second quarterly technical progress report, October 1994–December 1994.** AMAX Research and Development, Inc., Golden, CO (United States). 19 Jan 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC92206. Order Number DE95009361. Source: OSTI; NTIS; GPO Dep.

This document contains the Quarterly Technical Progress Report for the Micronized Magnetite Testing Project being performed at PETC's Process Research Facility (PRF). This second quarterly report covers the period from October, 1994 through December, 1994. The main accomplishments of Custom Coals and the project subcontractors, during this period, included: (1) Submitted all overdue project documents and kept up with routine reporting requirements; (2) Worked with CLI Corporation, the design subcontractor, and completed the circuit design and finalized all design drawings; (3) Specified and procured all of the process equipment for the circuit, as well as a number of ancillary equipment, instruments, and supplies; (4) Assisted Vangura Iron Inc. in detailing and constructing the structural and platework steel; (5) Subcontracted Rizzo & Sons to perform the circuit mechanical and electrical installation, and prepared for January 23rd installation start date; (6) Organized and prepared for coal and magnetite procurement; (7) Specified and organized an operating personnel plan for the commissioning and testing tasks in the project; (8) Assessed analytical challenges for project, and began to research problem areas. This report contains a short discussion of the project description, objectives, budget, schedule, and teaming arrangement. It also includes a detailed discussion of the abovementioned project accomplishments and plans, organized by the various task series within the project work plan. The final section contains an outline of the specific project goals for the next quarterly reporting period.

14710 (DOE/PC/92208–T9) **Engineering development of advanced physical fine coal cleaning for premium fuel applications. Quarterly technical progress report 9, October 1, 1994–December 31, 1994.** Moro, N. (AMAX Research and Development Center, Golden, CO (United States)); Shields, G.L.; Smit, F.J.; Jha, M.C. USDOE Pittsburgh Energy Technology Center, PA (United States); AMAX Research and Development Center, Golden, CO (United States). 25 Jan 1995. 53p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92208. Order Number DE95009336. Source: OSTI; NTIS; GPO Dep.

The primary goal of this project is the engineering development of two advanced physical fine coal cleaning processes, column flotation and selective agglomeration, for premium fuel applications. The project scope includes laboratory research and bench-scale testing on six coals to optimize these processes, followed by design, and construction of a 2-t/hr process development unit (PDU). The PDU will then be operated to generate 200 ton lots of each of three project coals, by each process. The project began in October, 1992 and is scheduled for completion by March, 1997. During Quarter 9 (October–December, 1995), parametric and optimization testing was completed for the Taggart, Sunnyside, and Indiana VII coal using a 12-inch Microcel™ flotation column. The detailed design of the 2-t/hr PDU grinding, flotation, and dewatering circuits neared completion with the specification of the major pieces of capital equipment to be purchased for these areas. Selective agglomeration test work investigated the properties of various industrial grades of heptane for use during bench- and PDU-scale testing. It was decided to use a hydrotreated grade of commercial

heptane due to its low cost and low concentration of aromatic compounds. The final Subtask 6.4 CWF Formulation Studies Test Plan was issued. A draft version of the Subtask 6.5 Preliminary Design and Test Plan Report was also issued, discussing the progress made in the design of the bench-scale selective agglomeration unit. PDU construction work moved forward through the issuing of 26 request for quotations and 21 award packages for capital equipment.

14711 (DOE/PC/92550–9) **Evaluation of hyperbaric filtration for fine coal dewatering. Ninth quarterly technical progress report, October 1–December 31, 1994.** Parekh, B.K. (Univ. of Kentucky, Lexington, KY (United States)); Leonard, J.W.; Hogg, R.; Fonesca, A. Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. [1995]. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92550. Order Number DE95009630. Source: OSTI; NTIS; GPO Dep.

The main objectives of the project are to investigate the fundamental aspects of particle-liquid interaction in fine coal dewatering, to conduct laboratory and pilot plant studies on the applicability of hyperbaric filter systems and to develop process conditions for dewatering of fine clean coal to less than 20% moisture. The program consists of three phases, namely: model development; laboratory studies; and field testing. The Pennsylvania State University is leading efforts in Phase 1, the University of Kentucky in Phase 2, and Consol Inc. in Phase 3 of the program. The Pennsylvania State University is developing a theoretical model for hyperbaric filtration systems, whereas the University of Kentucky is conducting experimental studies to investigate fundamental aspects of particle-liquid interaction and application of high pressure filter in fine coal dewatering. The optimum filtration conditions identified in Phase 1 and 2 will be tested in a Consol Inc. coal preparation plant using an Andritz Ruthner portable hyperbaric filtration unit. Results to date from all three phases are discussed.

14712 (DOE/PC/94116–T3) **Emissions reductions in coal-fired home heating stoves through use of briquettes. Quarterly report, October 1, 1994–December 31, 1994.** Acurex Environmental Corp., Research Triangle Park, NC (United States). 25 Jan 1995. 75p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94PC94116. Order Number DE95010627. Source: OSTI; NTIS; GPO Dep.

This quarter has seen additional experimentation in the briquette formulation. Several combustion tests have been performed. Many of the results are presented here, though the organics analysis is still in progress. A revised Environmental Questionnaire was submitted during this period. A revised contract was signed between the U.S. Department of Energy (DOE) and Acurex Environmental Corporation on November 18, 1994. With this event, business development tasks were restarted. At the conclusion of this period, the authors submitted a briquette formulation and process diagram to Euromining Consulting that will be used for the preparation of 2,500 tons of briquettes for with-product market testing, and combustion tests at the INCO Veritas (INCO) and Przedsiebiorstwo Energetyki Cieplnej (PEC) boiler houses.

14713 (BNL–60543) **Application of biochemical interactions in fossil fuels.** Lin, M.S.; Premuzic, E.T. Brookhaven National Lab., Upton, NY (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9407176–1: Minerals bioprocessing 2 conference, Snowbird, UT (United States), 10-15 Jul 1994). Order Number DE95009653. Source: OSTI; NTIS; GPO Dep.

Certain extreme environments tolerant microorganisms interact with heavy crude oils by means of multiple biochemical reactions, asphaltenes, and bituminous materials. These reactions proceed via pathways which involve characteristic components of oils and coals such as asphaltenes, and in the chemically related constituents found in bituminous coals. These chemical components serve as markers of the interactions between microorganisms and fossil fuels. Studies in which temperature, pressure, and salinity tolerant microorganisms have been allowed to interact with different crude oils and bituminous coals, have shown that biochemically induced changes occur in the distribution of hydrocarbons and in the chemical nature of organometallic and heterocyclic compounds. Such structural chemical rearrangements have direct applications in monitoring the efficiency, the extent, and the chemical nature of the fossil fuels bioconversion. Recent developments of chemical marker applications in the monitoring of fossil fuels bioconversion will be discussed.

14714 (CONF-940813–40) **Technology development for cobalt F-T catalysts. Topical report No.1, Effects of supports and promoters on cobalt F-T catalyst behavior in fixed bed vs. slurry bubble column reactors.** Oukaci, R. (Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering); Marcelin, G.; Goodwin, J.G. Jr. Energy International Corp., Pittsburgh, PA (United States); Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering. 17 Jan 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92108. From 208. American Chemical Society national meeting; Washington, DC (United States); 21-26 Aug 1994. Order Number DE95009368. Source: OSTI; NTIS; GPO Dep.

A series of cobalt-based F-T catalysts supported on alumina, silica, or titania were prepared with Ru and/or ZrO_2 as promoters. All catalysts were extensively characterized by different methods. The catalysts were evaluated in terms of their activity and selectivity both in fixed bed and slurry bubble column reactors. Similar trends were observed in both reactors for support effects. However, this was not the case for the effects of promoters. Noble metal promotion effects were much more accentuated in the fixed bed reactor than under slurry bubble column reaction conditions, while the opposite seemed to hold true in the case of ZrO_2 promotion effects, at least for SiO_2-supported Co catalysts.

14715 (CONF-940930–8) **Technology development for cobalt F-T catalysts. Topical report No.2, Comparison of patented F-T cobalt catalysts.** Oukaci, R. (Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering); Marcelin, G.; Goodwin, J.G. Jr. Energy International Corp., Pittsburgh, PA (United States); Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering. 17 Jan 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92108. From 11. annual international Pittsburgh coal conference: coal, energy and the environment; Pittsburgh, PA (United States); 12-16 Sep 1994. Order Number DE95009369. Source: OSTI; NTIS; GPO Dep.

Based on the information provided in patents assigned to Gulf, Shell, Exxon, and Statoil, a series of catalysts has been prepared consisting of 12–20 wt. % cobalt, a second metal promoter (Ru or Re), and an oxide promoter such as lanthana, zirconia, or alkali oxide, the support being alumina, silica, or titania. All catalysts have been extensively characterized by different methods. The catalysts have been evaluated in terms of their activity, selectivity both in a fixed bed reactor and in a slurry bubble column reactor, and the results correlated with their physico-chemical properties.

14716 (CONF-950402–6) **Technology development for cobalt F-T catalysts. Topical report No.3, Zirconia promotion of Fischer-Tropsch cobalt catalysts: Behavior in fixed-bed and slurry bubble column reactors.** Oukaci, R. (Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering); Marcelin, G.; Goodwin, J.G. Jr. Energy International Corp., Pittsburgh, PA (United States); Pittsburgh Univ., PA (United States). Dept. of Chemical and Petroleum Engineering. 17 Jan 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92108. From 209. American Chemical Society (ACS) national meeting; Anaheim, CA (United States); 2-6 Apr 1995. Order Number DE95009370. Source: OSTI; NTIS; GPO Dep.

A series of cobalt-based F-T catalysts supported on alumina and silica were prepared with different loadings of Zr and different sequences of impregnation of Co and Zr. All catalysts were extensively characterized by different methods. The catalysts were evaluated in terms of their activity and selectivity both in fixed bed and slurry bubble column reactors. Addition of ZrO_2 to both Co/SiO_2 and Co/Al_2O_3 catalysts resulted in at least a twofold increase in the catalyst activity for F-T synthesis in the fixed bed reactor. In

the slurry bubble column reactor, a similar promotion effect was observed for the SiO_2-supported catalysts, while the addition of Zr to a cobalt/alumina catalyst had a less significant effect.

14717 (DOE/MC/24116–4035) **Development of an advanced, continuous mild gasification process for the production of co-products. Quarterly report, October 1–December 31, 1994.** O'Neal, G.W. Coal Technology Corp., Bristol, VA (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-87MC24116. Order Number DE95010529. Source: OSTI; NTIS; GPO Dep.

The primary objective of this project is to develop an advanced continuous mild gasification process and product upgrading processes which will be capable of eventual commercialization. The program consists of four tasks. Task 1 is a literature survey of mild gasification processes and product upgrading methods and also a market assessment of markets for mild gasification products. Based on the literature survey, a mild gasification process and char upgrading method will be identified for further development. Task 2 is a bench-scale investigation of mild gasification to generate design data for a larger scale reactor. Task 3 is a bench-scale study of char upgrading to value added products. Task 4 is being implemented by building and operating a 1000-pound per hour demonstration facility. Task 4 also includes a technical and economic evaluation based on the performance of the mild gasification demonstration facility. The continuous coke pilot plant installation was completed in the fourth quarter of 1994. Start-up showed areas needing improvement. Initial formed coke production has used five formulations. In-house testing eliminated two with the remaining three formulations being used as guidelines for production of formed coke for use tests. Multiple tons runs will be made for these tests.

14718 (DOE/MC/25140–4009) **Hot Gas Cleanup Test Facility for gasification and pressurized combustion. Quarterly report, October–December 1994.** Southern Co. Services, Inc., Birmingham, AL (United States). Feb 1995. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-90MC25140. Order Number DE95000081. Source: OSTI; NTIS; GPO Dep.

The objective of this project is to evaluate hot gas particle control technologies using coal-derived gas streams. This will entail the design, construction, installation, and use of a flexible test facility which can operate under realistic gasification and combustion conditions. The major particulate control device issues to be addressed include the integration of the particulate control devices into coal utilization systems, on-line cleaning techniques, chemical and thermal degradation of components, fatigue or structural failures, blinding, collection efficiency as a function of particle size, and scale-up of particulate control systems to commercial size. The conceptual design of the facility was extended to include a within scope, phased expansion of the existing Hot Gas Cleanup Test Facility Cooperative Agreement to also address systems integration issues of hot particulate removal in advanced coal-based power generation systems. This expansion included the consideration of the following modules at the test facility in addition to the original Transport Reactor gas source and Hot Gas Cleanup Units: carbonizer/pressurized circulating fluidized bed gas source; hot gas cleanup units to mate to all gas streams; combustion gas turbine; and fuel cell and associated gas treatment. The major emphasis during this reporting period was continuing the detailed design of the facility and integrating the particulate control devices (PCDs) into structural and process designs. Substantial progress in underground construction activities was achieved during the quarter. Delivery and construction of coal handling and process structural steel began during the quarter. Delivery and construction of coal handling and process structural steel began during the quarter. MWK equipment at the grade level and the first tier are being set in the structure.

14719 (DOE/MC/25177–3935) **Assessment and evaluation of ceramic filter cleaning techniques: Task Order 19.** Chen, H.; Zaharchuk, R.; Harbaugh, L.B.; Klett, M. Gilbert/Commonwealth, Inc., Reading, PA (United States). Oct 1994. 246p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC25177. Order Number DE95000028. Source: OSTI; NTIS; GPO Dep.

The objective of this study was to assess and evaluate the effectiveness, appropriateness and economics of ceramic barrier filter cleaning techniques used for high-temperature and high-pressure particulate filtration. Three potential filter cleaning techniques were evaluated. These techniques include, conventional on-line pulse driven reverse gas filter cleaning, off-line reverse gas filter cleaning and a novel rapid pulse driven filter cleaning. These three ceramic filter cleaning techniques are either presently employed, or being considered for use, in the filtration of coal derived gas streams (combustion or gasification) under high-temperature high-pressure conditions. This study was divided into six subtasks: first principle analysis of ceramic barrier filter cleaning mechanisms; operational values for parameters identified with the filter cleaning mechanisms; evaluation and identification of potential ceramic filter cleaning techniques; development of conceptual designs for ceramic barrier filter systems and ceramic barrier filter cleaning systems for two DOE specified power plants; evaluation of ceramic barrier filter system cleaning techniques; and final report and presentation. Within individual sections of this report critical design and operational issues were evaluated and key findings were identified.

14720 (DOE/MC/26366–4006) **A calcium oxide sorbent process for bulk separation of carbon dioxide. Final report.** Han, C.; Silaban, A.; Narcida, M.; Harrison, D.P. Louisiana State Univ., Baton Rouge, LA (United States). Dept. of Chemical Engineering. Dec 1994. 276p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-89MC26366. Order Number DE95011399. Source: OSTI; NTIS; GPO Dep.

The expected commercialization of coal gasification technology in the US and world-wide will create a need for advanced gas purification and separation processes capable of operating at higher temperatures and in more hostile environments than is common today. For example, a high-temperature, high-pressure process capable of separating CO_2 from coal-derived gas may find application in purifying synthesis gas for H_2, NH_3, or CH_3OH production. High temperature CO_2 removal has the potential for significantly improving the operating efficiency of integrated gasification-molten carbonate fuel cells for electric power generation. This study proved the technical feasibility of a CO_2-separation process based upon the regenerable noncatalytic gas-solid reaction between CaO and CO_2 to form $CaCO_3$. Such a process operating at 650°C and 15 atm with 15% CO_2, in the feed gas has the potential for removing in excess of 99% of the CO_2 fed. Selection of a sorbent precursor which, upon calcination, produces high-porosity CaO is important for achieving rapid and complete reaction. The addition of magnesium to the sorbent appears to improve the multicycle durability at a cost of reduced CO_2 capacity per unit mass of sorbent. When CO and H_2O were present in the feed gas, the water gas shift and carbonation reactions occurred simultaneously, thus providing a potential alternate route for the production of H_2 from coal-derived gas. Material and energy balances based on an Aspen simulation were conducted by METC personnel. This phase of the study identified process related problems which must be addressed before the combined shift-carbonation process could become commercial. Other applications of the combined shift-carbonation process, in addition to the production of high purity H_2, have been suggested.

14721 (DOE/MC/27226–4039) **Development of biological coal gasification (MicGAS process). 18th Quarterly report.** ARCTECH, Inc., Chantilly, VA (United States). 24 Jan 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-90MC27226. Order Number DE95010525. Source: OSTI; NTIS; GPO Dep.

The paper reports the progress on the various tasks and subtasks associated with this project. Task 2, Enhance methane production, is complete. Experimental data are presented for its last subtask, Low cost nutrient amendment. Task 3, Effect of substrate on the microbes, has also been completed. Data and discussions are presented for the following subtasks: Effect of coal concentration; microbial resistance to inhibitors; and Detection of sulfur contaminant. Task 4, in progress, is Biomethanation of TxL in bioreactors. The paper discusses the investigation of more efficient bioconversion of low rank coals into methane using two stage bioreactors.

14722 (DOE/MC/29246–3981) **Hot coal gas desulfurization with manganese based sorbents. Quarterly report, June–September 1994.** Hepworth, M.T.; Slimane, R.B. Minnesota Univ., Minneapolis, MN (United States). Nov 1994. 24p. Sponsored by USDOE, Washington, DC (United States);Department of the Interior, Washington, DC (United States). DOE Contract AC21-92MC29246. Grant USDI-BM/C0299002-Mod.3. Order Number DE95000061. Source: OSTI; NTIS; GPO Dep.

The focus of work being performed on hot coal gas desulfurization at the Morgantown Energy Technology Center is primarily in the use of zinc titanate sorbents; however, prior studies indicated that an alternate sorbent, manganese dioxide-containing ore in mixture with alumina (75 wt% ore + 25 wt% Al_2O_3) appears to be a strong contender to zinc-based sorbents. Manganese, for example, has a lower vapor pressure in the elemental state than zinc; hence, it is not as likely to undergo zinc-depletion from the sorbent surface upon loading and regeneration cycles. Also manganese oxide is less readily reduced to the elemental state than iron; hence, the range of reduction potentials for oxygen is somewhat greater than for zinc ferrite. In addition, thermodynamic analysis of the manganese-oxygen-sulfur system shows it to be less amenable to sulfation than zinc ferrite. Also manganese chlorides are much less stable and volatile than zinc chlorides. Potential also exists for utilization of manganese at higher temperatures than zinc ferrite or zinc titanate. This Eighth Quarterly Report documents progress in pelletizing and testing via thermo-gravimetric analysis of individual pellet formulations of manganese ore/alumina combinations and also manganese carbonate/alumina with two binders, dextrin and bentonite.

14723 (DOE/MC/29261–4020) **Trace element emissions. Semi-annual report, October 1994–February 1995.** Pigeaud, A.; Maru, H.; Wilemski, G.; Helble, J. Energy Research Corp., Danbury, CT (United States). Feb 1995. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC29261. Order Number DE95000090. Source: OSTI; NTIS; GPO Dep.

Many trace elements can exist in raw coal gas either in the form of metallic vapors or gaseous compounds which, besides their action on potentially "very clean" advanced power generating systems such as fuel cells and gas turbines, can also be detrimental to plant and animal life when released into the atmosphere. Therefore, volatile trace contaminants from coal which can also be toxic must be removed before they become detrimental to both power plant performance/endurance and the environment. Five trace elements were selected in this project based on: abundance in solid coal, volatility during gasification, effects on downstream systems and toxicity to plant and animal life. An understanding was sought in this investigation of the interactions of these five trace elements (and their high temperature species) with the different components in integrated cleanup and power generating systems, as well as the ultimate effects with respect to atmospheric emissions. Utilizing thermodynamic calculations and various experimental techniques, it was determined that a number of trace contaminants that exist in coal may be substantially removed by flyash, and after that by different sorbent systems. High temperature cleanup of contaminants by sorbents such as zinc titanate, primarily to remove sulfur, can also absorb some metallic contaminants such as cadmium and antimony. Further polishing will be required, however, to eliminate trace contaminant species incorporating the elements arsenic, selemium, lead, and mercury.

14724 (DOE/MC/30012–4021) **Advanced sulfur control concepts for hot gas desulfurization technology. Quarterly report, October–December 1994.** Harrison, D.P. Louisiana State Univ., Baton Rouge, LA (United States). Dept. of Chemical Engineering. Jan 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-94MC30012. Order Number DE95000091. Source: OSTI; NTIS; GPO Dep.

The goal is the development of simpler and economically superior processing of regenerable sorbents used for control of hydrogen sulfide in hot, high-pressure gas streams in advanced power generating systems. The improved processing will produce an elemental sulfur byproduct. Progress during the past quarter was limited by delays in identifying an appropriate analytical instrument for measuring the concentration of sulfur species ($S_x(g)$, H_2S, and SO_2 in the regeneration product gas. The ability to carry out this analysis on a real-time basis is an important component of the overall project and we feel that a satisfactory gas analysis procedure should be available before forging ahead with other experimental activities. The primary accomplishment, therefore, was the completion and submission of the Task 3 Project Plan. This plan, which assumed a satisfactory solution to sulfur analysis problem, is included in this quarterly report.

14725 (DOE/METC/C–95/7184) **Hot gas particulate cleanup for advanced coal-based power systems.** Dennis, R.A.; McDaniel, H.M.; McMahon, T.J. USDOE Morgantown Energy Technology Center, WV (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). (CONF-950629–4: ASME international gas turbine and aeroengine congress and exposition: land, sea and air, Houston, TX (United States), 5-8 Jun 1995). Order Number DE95010307. Source: OSTI; NTIS; GPO Dep.

Integrated Gasification Combined Cycle and Pressurized Fluidized-Bed Combustion power systems have made it possible to use coal while still protecting the environment. Such power systems virtually eliminate the pollutants associated with coal-fired plants built before the 1970's. Superior environmental performance and high system efficiency requires that gas stream cleanup be conducted under high temperature and high pressure process conditions. To realize this high system efficiency, particulate cleanup levels must meet gas turbine particulate tolerance limits. Discussed below are some of the particulate cleanup requirements and challenges for these advanced power systems. Also presented is the work underway to support particulate cleanup technology and the Clean Coal Technology (CCT) Program through pilot-scale testing and filter component development.

14726 (DOE/PC/88881–T25) **Engineering development of advanced physical fine coal cleaning technologies - froth flotation. Quarterly technical progress report No. 24, July 1, 1994–September 30, 1994.** ICF Kaiser Engineers, Inc., Pittsburgh, PA (United States). [1995]. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-88PC88881. Order Number DE95009346. Source: OSTI; NTIS; GPO Dep.

A study conducted by Pittsburgh Energy Technology Center of sulfur emissions from about 1,300 United States coal-fired utility boilers indicated that half of the emissions were the result of burning coals having greater than 1.2 pounds of SO_2 per million BTU. This was mainly attributed to the high pyritic sulfur content of the boiler fuel. A significant reduction in SO_2 emissions could be accomplished by removing the pyrite from the coals by advanced physical fine coal cleaning. An engineering development project was prepared to build upon the basic research effort conducted under a solicitation for research into Fine Coal Surface Control. The engineering development project is intended to use general plant design knowledge and conceptualize a plant to utilize advanced froth flotation technology to process coal and produce a product having maximum practical pyritic sulfur reduction consistent with maximum practical BTU recovery.

14727 (DOE/PC/90296–T10) **Structure and thermochemical kinetic studies of coal pyrolysis. Final technical report.** Dodoo, J.N.D.; Hetzberg, M. Maryland Univ., Princess Anne, MD (United States). Dept. of Natural Sciences. [1994]. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90296. Order Number DE95006351. Source: OSTI; NTIS; GPO Dep.

The structure and kinetics of low rank coals, namely, Montana Rosebud subbituminous and Beulah lignite coals have been studied. CO_2 laser heating of separated arrays of particles at high flux levels has made possible the investigation of the pyrolysis and char oxidation processes of lignite and subbituminous coal particles as a function of exposure time at laser fluxes of 200–300 w/cm^2. The Beulah lignite and Rosebud subbituminous coals studied were supplied by the Penn State Coal Sample Bank. They had been collected, ground, and packaged in an inert atmosphere. The coal samples were subsequently stored, sieved, carefully dried, and maintained in a glove box under dry nitrogen. The moisture loss of the as-received samples was within experimental error of the supplied ASTM analysis. The mass loss vs time reported here are for

particles that were dried at 120°C under nitrogen. The morphological changes in the particles with laser exposure was monitored by scanning electron microscopy. Correlation of weight loss data with microscopic observation has been made for the devolatilization in air atmosphere. Care was taken to insure that mass loss did not reflect loss of particles. Pyrolysis rates were determined for particles in air and in a nitrogen flow, and compared with the results of corresponding laser pyrolysis studies of high and low-volatile bituminous coal particle arrays. Elemental analysis of the char particles were also carried out. The studies were extended to a typical run-of-the mill coal samples collected from a power generating company.

14728 (DOE/PC/91040–48) **Advanced direct liquefaction concepts for PETC generic units. Quarterly technical progress report, July–September 1994.** Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research; Sandia National Labs., Albuquerque, NM (United States); CONSOL, Inc., Pittsburgh, PA (United States); LDP Associates (United States). Nov 1994. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91040. Order Number DE95010505. Source: OSTI; NTIS; GPO Dep.

The aims of this research program are to advance to bench-scale testing, concepts that have the potential for making net reductions in direct coal liquefaction process costs. The research involves a teaming arrangement between the University of Kentucky Center for Applied Energy Research (CAER), Consolidation Coal Company (CONSOL), Sandia National Laboratories (SNL), and LDP Associates. In general, the process concepts involve "pretreatment", that is, chemical and physical modifications to the feed materials to the liquefaction process, prior to their introduction into the liquefaction reactors. CAER and SNL will evaluate chemical approaches to allow better control of the initial conversion reactions through (1) the use of CO pretreatment to stabilize the coal, reject oxygen (thereby lowering hydrogen consumption), and inhibit the propensity for regressive reactions (CAER); (2) the introduction of promoted dispersed iron-based catalysts (CAER); and (3) the production of active H-donor distillate solvent fractions (SNL), using dewaxed distillate (CONSOL) and fluid coker overhead (CAER–CONSOL) as feedstocks. CONSOL will study oil agglomeration for the rejection of coal ash, ash in the recycled resid, and, potentially, catalyst recovery. The success of the research in developing an integrated process concept will be gauged in part by the results of an economic evaluation (LDP Associates). Emphasis will be given to low-rank coals. Accomplishments for this quarter are described.

14729 (DOE/PC/91051–T8-Vol.2) **Advanced liquefaction using coal swelling and catalyst dispersion techniques. Volume 2, appendices. Final technical report, October 1, 1991–September 30, 1994.** Curtis, C.W. (Auburn Univ., AL (United States)); Chander, S.; Gutterman, C. Amoco Oil Co., Naperville, IL (United States). Research and Development Dept. [1995]. 396p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91051. Order Number DE95009648. Source: OSTI; NTIS; GPO Dep.

Liquefaction experiments were undertaken using subbituminous Black Thunder mine coal to observe the effects of aqueous SO_2 coal beneficiation and the introduction of various coal swelling solvents and catalyst precursors. Aqueous SO_2 beneficiation of Black Thunder coal removed alkali metals and alkaline earth metals, increased the sulfur content and increased the catalytic liquefaction conversion to THF solubles compared to untreated Black Thunder coal. The liquefaction solvent had varying effects on coal conversion, depending upon the type of solvent added. The hydrogen donor solvent, dihydroanthracene, was most effective, while a coal-derived Wilsonville solvent promoted more coal conversion than did relatively inert 1-methylnaphthalene. Swelling of coal with hydrogen bonding solvents tetrahydrofuran (THF), isopropanol, and methanol, prior to reaction resulted in increased noncatalytic conversion of both untreated and SO_2 treated Black Thunder coals, while dimethylsulfoxide (DMSO), which was absorbed more into the coal than any other swelling solvent, was detrimental to coal conversion. Swelling of SO_2 treated coal before liquefaction resulted in the highest coal conversions; however, the untreated coal showed the most improvements in catalytic reactions when swelled in either THF, isopropanol, or methanol prior to liquefaction. The aprotic solvent DMSO was detrimental to coal conversion.

14730 (DOE/PC/91055–T10) **Role of the resid solvent in catalytic coprocessing. Quarterly report, October 1994–December 1994.** Curtis, C.W. Auburn Univ., AL (United States). [1995]. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91055. Order Number DE95010395. Source: OSTI; NTIS; GPO Dep.

This quarterly report summarizes the authors' work in characterizing resid solvents in the coal liquefaction process. The research performed this quarter involved a literature review in which the literature involving naphthenic structures was reviewed to ascertain if any new literature was available that could provide insights into this work. The literature review is given in part one of this report. The second aspect of the work was the performance of additional model compound studies to complete the work that has been previously performed. The third part of this report was the work performed in preparation for the Department of Energy review to be held on January 24, 1995, in Pittsburgh, PA. The written documentation was due to the Department of Energy in December and is attached as Part 3 of this report.

14731 (DOE/PC/91281–T13) **Low severity coal liquefaction promoted by cyclic olefins. Quarterly report, October 1994–December 1994.** Curtis, C.W. Auburn Univ., AL (United States). [1995]. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91281. Order Number DE95010628. Source: OSTI; NTIS; GPO Dep.

The research performed during the October to December 1994 quarter centered on two areas. The first area involved the writing of a paper based on research performed on this project concerning the mild acidic pretreatment of low rank coals and their liquefaction behavior in the presence of hydrogen donors with different reactivities. The second area that was worked on during the quarter was the high temperature infrared analysis of cyclic olefins. The work is ongoing and is currently involving a considerable amount of equipment and technique development. Cyclic olefins, such as 1,4,5,8-tetrahydronaphthalene (isotetralin) and 1,4,5,8,9,10-hexahydroanthracene (HHA), are highly reactive hydrogen donor compounds that readily donate their hydrogen to coal and model acceptors when heated. Numerous reactions have been performed using these cyclic olefins with high rank and low rank coals as well as with model acceptors. In each case the cyclic olefins have proven themselves to be active donors. Further evaluation of the reactivity of these donors with pretreated low rank coals and at different temperatures is described more fully in this report.

14732 (DOE/PC/91287–16) **Supercritical thermodynamics of sulfur and nitrogen species. Final technical report, October 1, 1991–September 30, 1994.** Eckert, C.A. Georgia Inst. of Tech., Atlanta, GA (United States). School of Chemical Engineering. [1994]. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91287. Order Number DE95007893. Source: OSTI; NTIS; GPO Dep.

Significant opportunity exists for the application of supercritical fluid (SCF) technology to coal processing, both for pretreatment of high sulfur coals, as well as liquefaction and treatment of coal liquids. Supercritical fluids are attractive solvents for a variety of coal processing applications because of their unusual solvating and mass transfer properties. Solubility studies have been carried out for a number of model coal and coal-liquid compounds, primarily in pure supercritical fluids. We have extended this database of model coal compound equilibria using modern techniques that have the advantage of being much more rapid than traditional techniques. Cosolvent effects on solubility have also been investigated over a variety of solvent properties. In addition, specific molecular interactions have been investigated through spectroscopic techniques. The resulting data has been used to develop a physical-chemical equation of state (EOS) model of SCF solutions with meaningful parameters. This equation of state model has been used to predict solubility behavior, which will permit the design and tailoring of SCF cosolvent systems for specific coal processing applications.

14733 (DOE/PC/91291–T14) **Mechanism of hydrogen incorporation in coal liquefaction. Fourteenth progress report,**

October 1994–December 1994. Kentucky Univ., Lexington, KY (United States). Research Foundation. [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91291. Order Number DE95010647. Source: OSTI; NTIS; GPO Dep.

The authors continued work on the reaction of D_2 with organic compounds. The focus of this work is to reveal the mechanism of hydrogen reaction during coal liquefaction.

14734 (DOE/PC/92120–T7) **Advanced coal liquefaction. Final quarterly report, July 1, 1994–September 31, 1994.** Media and Process Technology, Inc., Pittsburgh, PA (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC92120. Order Number DE95009367. Source: OSTI; NTIS; GPO Dep.

In this quarter, the authors investigated means to overcome the membrane fouling in the presence of tetraline at 150°C. Previously, it was indicated that tetraline underwent degradation at this temperature. Further, it was identified that this reaction could be minimized if one purged tetraline with nitrogen. It was hypothesized that tetraline could be stable at 150°C in the absence of oxygen. In this quarter, the authors attempted to apply the similar concept in the membrane filtration system. The entire filtration was thoroughly purged with nitrogen before introducing tetraline. Also during filtration, the collection bottle was purged with nitrogen. The permeate stream was maintained vacuum. Under this condition, the tetraline collected from reject and permeate did not show any chemical degradation. It is believed that the porous surface of Al_2O_3/SiO_2 membranes may act as a catalyst for the degradation of tetraline. The degradation products, likely polymeric, fouled the membrane. The above tests were repeated and a similar fouling phenomenon was observed.

14735 (DOE/PC/92122–T8) **Novel bimetallic dispersed catalysts for temperature-programmed coal liquefaction. Technical progress report, July–September 1994.** Schmidt, E.; Kirby, S.; Song, Chunshan; Schobert, H.H. Pennsylvania State Univ., University Park, PA (United States). Dept. of Materials Science and Engineering. Nov 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92122. Order Number DE95010616. Source: OSTI; NTIS; GPO Dep.

Coal liquefaction involves cleavage of methylene and dimethylene bridges connecting polycyclic aromatic units and the reactions of various oxygen functional groups. The selected compound for model coal liquefaction reactions are 4-(l-naphthylmethyl)bibenzyl (NMBB) and anthrone. This report describes (1) the synthesis and screening of selected iron carbonyl complexes as precursors of dispersed catalysts for hydrocracking of NMBB, and (2) the hydrogenation and hydrodeoxygenation reactions of anthrone. Experiments were carried out at 400°C (for NMBB) or at both 300°C and 400°C (for anthrone) for 30 min under 6.9 MPa H_2 pressure. All catalyst precursors converted NMBB predominately into naphthalene and 4-methylbibenzyl. Small amounts of secondary products were formed by hydrogenation, isomerization and fragmentation of the primary products. The greatest activity among the tested catalysts was found using iron pentacarbonyl with added sulfur. Increasing cluster size lead to decreased activity. The beneficial effect of sulfur was also demonstrated in a reaction of iron pentacarbonyl and NMBB. A sulfur-free run showed substantially smaller conversion, whereas an experiment with added sulfur gave considerably higher conversion. Again, the same trend between cluster size and catalyst activity was observed. The objective of examining oxygen-containing compounds is to investigate the possibility of reduced oxygen functionality in the products of a reaction performed under liquefaction conditions, with the use of highly dispersed catalysts from monometallic and bimetallic organometallic precursors. Both the Ni-Mo and CoMo-T2 precursors showed an increase in the yield of non-0-containing products, compared to a non-catalytic reaction or one using a standard inorganic catalyst precursor, ammonium tetrathiomolybdate (ATTM).

14736 (DOE/PC/92147–6) **Catalytic multi-stage liquefaction of coal. Sixth quarterly report, 1 January 1994–31 March 1994.** Comolli, A.G.; Lee, L.K.; Pradhan, V.R.; Stalzer, R.H. Hydrocarbon Research, Inc., Princeton, NJ (United States). May 1994. 61p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC92147. Order Number DE95005527. Source: OSTI; NTIS; GPO Dep.

The overall objective of this program is to produce liquid fuels from coal by direct liquefaction at a cost that is competitive with conventional fuels. Specifically, this continuous bench-scale program contains provisions to examine new ideas in areas such as low temperature pretreatments, more effective catalysts, on-line hydrotreating, new coal feedstocks, other hydrogen sources, more concentrated coal feeds and other highly responsive process improvements while assessing the design and economics of the bench-scale results. This quarterly report covers work on Laboratory Scale Studies, Continuous Bench-Scale Operations, Technical Assessment and Project Management.

14737 (DOE/PC/92147–8) **Catalytic multi-stage liquefaction of coal. Final eighth quarterly report, 1 July 1994–30 September 1994.** Comolli, A.G.; Johanson, E.S.; Lee, L.K.; Pradhan, V.R.; Stalzer, R.H. Hydrocarbon Research, Inc., Princeton, NJ (United States). Oct 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93PC92147. Order Number DE95011365. Source: OSTI; NTIS; GPO Dep.

This quarterly report covers the activities of Catalytic Multi-Stage Liquefaction of Coal during the Period July 1–September 30, 1994, at Hydrocarbon Research, Inc. in Lawrenceville and Princeton, New Jersey. This DOE Contract Period is from December 8, 1992 to December 7, 1994. The overall objective of this program is to produce liquid fuels from coal by direct liquefaction at a cost that is competitive with conventional fuels. Specifically, this continuous bench-scale program contains provisions to examine new ideas in areas such as: low temperature pretreatments, more effective catalysts, on-line hydrotreating, new coal feedstocks, other hydrogen sources, more concentrated coal feeds and other highly responsive process improvements while assessing the design and economics of the bench-scale results. This quarterly report covers work on Laboratory Scale Studies, Continuous Bench-Scale Operations, Technical Assessment and Project Management.

14738 (DOE/PC/93205–T5) **Short contact time direct coal liquefaction using a novel batch reactor. Progress report, September 15, 1994–January 15, 1995.** Klein, M.T.; Calkins, W.H. Delaware Univ., Newark, DE (United States). 15 Jan 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93205. Order Number DE95010365. Source: OSTI; NTIS; GPO Dep.

As has been stated in previous progress reports, the objective of this research is to optimize the design and operation of the bench scale batch reactor (SCTBR) for coal liquefaction at short contact times (0.01 to 10 minutes or longer). This reactor is simple enough in design and low enough in cost to serve as a suitable replacement for the traditional tubing-bomb reactors for many coal liquefaction and other high-pressure, high-temperature reaction studies. The liquefaction of selected Argonne Premium coals and the role of organic oxygen components of the coal and their reaction pathways during liquefaction at very low conversions are being investigated with this apparatus.

14739 (DOE/PC/93220–T5) **Production of elemental sulfur from H_2S and CO_2 derived from a coal desulfurization process. Quarterly technical progress report, October 1, 1994–December 31, 1994.** Jiang, Xueyu; Khang, Soon-Jai. Cincinnati Univ., OH (United States). Dept. of Chemical Engineering. [1995]. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93220. Order Number DE95010393. Source: OSTI; NTIS; GPO Dep.

During the fifth quarter of the project, temperature profile in the new reactor was measured under various conditions and result indicated that in the middle of the reactor (five to six inches in length) the temperature profile could be regarded as isothermal. X-ray diffraction was tried to determine the structure and composition of the CoO-MoO_3-alumina catalyst before and after the catalytic reaction. The results of X-ray diffraction showed that the catalyst was not in the crystal form, hence this method would not be applicable to this investigation. New flowmeters were replaced in the reaction system and calibrated to control the flowrate of H_2S, CO_2, H_2 and N_2. The experimental results from the quartz tube reactor were summarized. The results showed that H_2S conversion increased

with increasing temperature when used with the $CoO-MoO_3$-Alumina catalyst. Further thermodynamic analyses on conversion of H_2S, yield of S_2 and selectivity of S_2 were performed by using Stanjan method, which helped the interpreting of experimental results.

14740 (DOE/PC/94055–T1) **Technology development for iron Fischer-Tropsch catalysis. Quarterly technical progress report, October–December, 1994.** Kentucky Univ., Lexington, KY (United States). Research Foundation. [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-94PC94055. Order Number DE95009339. Source: OSTI; NTIS; GPO Dep.

Fischer-Tropsch catalysts must undergo a pretreatment in order to be active. As part of the authors comprehensive study to maximize the activity of iron based precipitated Fischer-Tropsch catalysts, they are currently attempting to optimize the activation procedure. Although they are able to achieve high activity using CO pretreatment, the catalysts tend to deactivate suddenly and rapidly after 500 hr of synthesis. Kolbel reports high CO conversion comparable to these results at a lower gas flow (2.4 vs. 3.4 nL/hr-g(Fe)); however, he achieved greater stability with conversions reported to be 90% after 1,400 hrs. One possibility for Kolbel's higher stability could be due to the activation procedure. Herein are reported the initial results of a study to optimize the catalyst composition and the operating conditions for the iron based slurry phase Fischer-Tropsch synthesis when synthesis gas activation is utilized.

14741 (ETDE/JP-mf–95769798) **Japan's New Sunshine Project. 1993 Annual Summary of Coal Liquefaction and Gasification.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Sep 1994. 202p. (In Japanese). Order Number DE95769798. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

This report describes the achievement of coal liquefaction and gasification technology development in the New Sunshine Project for FY 1993. It presents the research and development of coal liquefaction technologies which includes studies on liquefaction characteristics of various coals and mechanism of catalytic reaction for liquefaction, the research and development of coal gasification technologies which includes studies on gasification characteristics of various coals and improvement of efficiency of coal gasification, the development of bituminous coal liquefaction which includes research of engineering, construction and operation of a 150 t/d bituminous coal liquefaction PP (pilot plant) and supporting research by a PSU (process supporting unit), the development of brown coal liquefaction which includes research on brown coal liquefaction with 50 t/d PP and development of techniques for upgrading coal oil from brown coal, the development of common base technologies which includes coal selection studies, research of upgrading technology of coal derived distillates and study on toxicological and environmental effects, the development of coal-based hydrogen production technology with a PP, the development of entrained flow coal gasification power generation plant, the assessment of coal hydrogasification, and the international co-operation. 110 figs., 41 tabs.

14742 (ETDE/JP-mf–95769799) **Symposium of Clean Coal Technology 1992.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). 2 Sep 1994. 78p. Order Number DE95769799. Source: OSTI; NTIS; Available from Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

This proceedings compiles presentations for the Symposium on Clean Coal Technology 1992. Are compiled 'Strategy of clean coal technology in Japan' by NEDO, Japan, 'Status of Clean Coal Technology Demonstration Program of the United States Department of Energy' by U.S. Department of Energy, 'Clean coal technology, an option for Indonesia' by Department of Mines and Energy, Indonesia, 'Present status of clean coal technology development activities in Japan' by Center for Coal Utilization, Japan, 'Clean coal technology in Australia' by Department of Primary Industries and Energy, Australia, 'The present situation of coal combustion technology and the environmental impacts in China' by Ministry of Energy, China, and 'APEC clean coal activities' by East-West Center, USA. 21 figs., 10 tabs.

14743 (PNL-SA–24495) **Mechanisms of iron-based catalysis investigated using model compounds.** Linehan, J.C.; Matson, D.W.; Darab, J.G.; Autrey, S.T.; Franz, J.A.; Camaioni, D.M. Pacific Northwest Lab., Richland, WA (United States). Aug 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-940813–39: 208. American Chemical Society national meeting, Washington, DC (United States), 21-26 Aug 1994). Order Number DE95007815. Source: OSTI; NTIS; GPO Dep.

The catalytic mechanism of highly active, nanophase, iron-based coal liquefaction catalysts was investigated using a series of model compounds. The iron-oxide phases ferric oxyhydroxysulfate (OHS), 6-line ferrihydrite, hematite, and goethite, were evaluated as catalyst precursors with systematically substituted diphenylmethanes in the presence of a hydrogen donating solvent. The activity of the catalysts was observed to be dependent upon the functionality on the model compounds. The results of these model compound studies and their relationship to possible reaction mechanisms are presented.

0105 Products and By-Products

14744 (DOE/MC/30251–3975) **High-volume, high-value usage of Flue Gas Desulfurization (FGD) by-products in underground mines Phase 1: Laboratory investigations. Quarterly report, July 1994–September 1994.** Kentucky Univ., Lexington, KY (United States). Center for Applied Energy Research. Dec 1994. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-93MC30251. Order Number DE95000059. Source: OSTI; NTIS; GPO Dep.

During the quarter a second series of samples were collected and partially characterized chemically and mineralogically. The samples were collected at the disposal site operated by Freeman United Coal Co. The second collection was necessary because of deterioration due to hydration of the original samples. A study of the hydration characteristics was completed during the quarter. Important reactions included the immediate formation of ettringite and portlandite. The hydration and transformation was found to be a slow process. A second phase of gypsum formation from ettringite deterioration was identified. The slow hydration of anhydrite with its resultant swell is a potential problem which will be addressed further. Geotechnical characterization, during the quarter included completion of the preliminary characterization, analysis of the findings, experimentation with sample preparation for the final characterization/mix design, and design of the final experimental program. The analysis of the coals collected during the core drilling and hydrologic planning were completed. Also during the quarter a meeting was held with representatives of the shotcrete industry to discuss transport systems for emplacement. The pros and cons of pneumatic and hydraulic systems were discussed and plans formulated for further investigations.

0106 Properties and Composition

14745 (DOE/PC/89757–T1) **Coal surface structure and thermodynamics. Final report.** Larsen, J.W.; Wernett, P.C.; Glass, A.S.; Quay, D.; Roberts, J. Lehigh Univ., Bethlehem, PA (United States). Dept. of Chemistry. May 1994. 413p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89757. Order Number DE95005301. Source: OSTI; NTIS; GPO Dep.

Coals surfaces were studied using static surface adsorption measurements, low angle x-ray scattering (LAXS), inverse gas chromatography (IGC) and a new ^{13}C NMR relaxation technique. A comparison of surface areas determined by hydrocarbon gas adsorption and LAXS led to the twin conclusions that the hydrocarbons had to diffuse through the solid to reach isolated pores and that the coal pores do not form interconnected networks, but are largely isolated. This conclusion was confirmed when IGC data for

small hydrocarbons showed no discontinuities in their size dependence as usually observed with porous solids. IGC is capable of providing adsorption thermodynamics of gases on coal surfaces. The interactions of non-polar molecules and coal surfaces are directly proportioned to the gas molecular polarizability. For bases, the adsorption enthalpy is equal to the polarizability interaction plus the heat of hydrogen bond formation with phenol. Amphoteric molecules have more complex interactions. Mineral matter can have highly specific effects on surface interactions, but with most of the molecules studied is not an important factor.

14746 (DOE/PC/92527–T9) **Hindered diffusion of coal liquids. Quarterly report No. 9, September 18, 1994–December 17, 1994.** Tsotsis, T.T. (Univ. of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering); Sahimi, M.; Webster, I.A. University of Southern California, Los Angeles, CA (United States). Dept. of Chemical Engineering. [1995]. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92527. Order Number DE95010364. Source: OSTI; NTIS; GPO Dep.

The design of industrial catalysts requires that the diffusivity of the reacting species within the catalyst be accurately known. Nowhere is this more important than in the area of coal liquefaction and upgrading of coal liquids. In this area, one is faced with the task of processing a number of heavy oils, containing metals and other contaminants, in a variety of process dependent solvents. It is important, therefore, on the basis of predicting catalyst activity, selectivity, and optimizing reactor performance, that the diffusivities of these oil species be accurately known.

14747 (DOE/PC/92544–10) **Vapor pressures and heats of vaporization of primary coal tars. Quarterly technical progress report, 1 October–31 December 1994.** Suuberg, E.M. Brown Univ., Providence, RI (United States). Div. of Engineering. [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92544. Order Number DE95009632. Source: OSTI; NTIS; GPO Dep.

The vapor pressure correlations that exist at present for coal tars are very crude and they are not considered reliable to even an order of magnitude when applied to tars. The present project seeks to address this important gap in the near term by direct measurement of vapor pressures of coal tar fractions, by application of well-established techniques and modifications thereof. The principal objectives of the program are to: (1) obtain data on the vapor pressures and heats of vaporization of tars from a range of ranks of coal, (2) develop correlations based on a minimum set of conveniently measurable characteristics of the tars, and (3) develop equipment that would allow performing such measurements in a reliable, straightforward fashion. A significant amount of time has been devoted during this quarter to testing the equipment for measurements by the gas saturation method and the Knudsen effusion method. These techniques are beginning to yield reliable results. Some key features of the methods are summarized, and sample results presented.

14748 (DOE/PC/93223–T4) **Surface properties of photo-oxidized bituminous coals. Technical progress report, October 1994–December 1994.** Mitchell, G.; Davis, A.; Chander, S. Pennsylvania State Univ., University Park, PA (United States). Feb 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-93PC93223. Order Number DE95010394. Source: OSTI; NTIS; GPO Dep.

During this report period, results were obtained from coal samples photo-oxidized in blue light for evaluation by Secondary Ion Mass Spectrometry (SIMS) at the University of New South Wales and by Scanning Transmission X-ray Microscopy (STXM) at Brookhaven National Laboratory. SIMS analyses of the Pittsburgh seam coal showed that considerably more ions were generated from the photo-oxidized surface compared with the fresh. Also, a higher concentration of molecular fragments with oxygen-containing and C-C double bonded functional groups were obtained from the irradiated surface. Because these measurements were qualitative, it was suggested that X-ray Photoelectron Spectroscopy (XPS) may be an alternative means of determining the concentration of total oxygen content at the coal surface. In addition to XPS of the current sample, another sample of the Pittsburgh seam vitrinite with areas of 100 μm irradiated for different times (1, 5 and 10 min) was provided to the University of New South Wales in mid-November. Results obtained from the STXM technique are informative. Evaluation of C-NEXAFS spectra obtained in the region of 280 to 300 eV from both coals and for areas irradiated for different times showed significant differences in the intensity of energy bands assigned to CH_3 (285.5 eV), OH (287 eV) and C=O (289.5 eV) functional groups attached to aromatic rings.

14749 (DOE/PC/94226–T1) **Development of a video-based slurry sensor for on-line ash analysis. First quarterly technical progress report, October 1, 1994–December 31, 1994.** Adel, G.T.; Luttrell, G.H. Virginia Polytechnic Inst. and State Univ., Blacksburg, VA (United States). Dept. of Mining and Minerals Engineering. 28 Jan 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94226. Order Number DE95010366. Source: OSTI; NTIS; GPO Dep.

Automatic control of fine coal cleaning circuits has traditionally been limited by the lack of sensors for on-line ash analysis. Although several nuclear-based analyzers are available, none have seen widespread acceptance. This is largely due to the fact that nuclear sensors are expensive and tend to be influenced by changes in seam type and pyrite content. Recently, researchers at VPI&SU have developed an optical sensor for phosphate analysis. The sensor uses image processing technology to analyze video images of phosphate ore. It is currently being used by Texasgulf for off-line analysis of dry flotation concentrates. The primary advantages of optical sensors over nuclear sensors are that they are significantly cheaper, are not subject to measurement variations due to changes in high atomic number minerals, are inherently safer and require no special radiation permitting. The purpose of this work is to apply the knowledge gained in the development of an optical phosphate analyzer to the development of an on-line ash analyzer for fine coal slurries. During the past quarter, all project planning was completed and an agreement was reached with Pittston Coal Company whereby the Middle Fork preparation plant would serve as the industrial test site for the optical sensor. In addition, all equipment was purchased for constructing the sensor and two prototype sample presentation systems were developed. Test work is currently underway to evaluate the performance of these sample presentation systems.

14750 (DOE/MC/28060–95/C0443) **A field demonstration of the use of wet and dry scrubber sludges in engineered structures.** Wolfe, W.E. (Dravo Lime Co., Pittsburgh, PA (United States)); Cline, J.H. Dravo Lime Co., Pittsburgh, PA (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-91MC28060. (CONF-950106–1: 11. international symposium on use and management of coal combustion by-products (CCBs), Orlando, FL (United States), 15-19 Jan 1995). Order Number DE95008360. Source: OSTI; NTIS; GPO Dep.

In a research program being performed at The Ohio State University, the agronomic and engineering properties of flue gas desulfurization by-products are being evaluated. The purpose of this project is to identify potentially beneficial uses for these materials and in so doing reduce the amount of by-product that must be disposed of in landfills. The results of the experimental program have demonstrated that FGD by-products possess the physical properties that should make them suitable for use as a select fill in a variety of construction projects. To verify the laboratory findings on a larger scale, work was begun on a number of field demonstration projects in which the behavior of the FGD could be evaluated under actual field conditions. Two of these field projects were conducted at an Ohio State University research farm where both wet and dry FGD materials were used to stabilize the soil bases in cattle feedlots. Ash from American Electric Power's Tidd PFBC plant in Brilliant, Ohio was placed in three lots each designed to accommodate approximately fifty animals. Stability wet scrubber sludge from AEP's Conesville, Ohio plant was placed at two hay bale storage and Winter feeding sites. The construction of

the test plots is described. Visual inspections of the plots as well as laboratory tests on samples of the by-product collected at several times during the months since the FGD bases installed have shown that in general, the materials have performed satisfactorily.

14751 (DOE/MC/28060–95/C0445) **Use of clean coal technology by-products as agricultural liming techniques.** Stehouwer, R.C. (Ohio Agricultural Research and Development Center, Wooster, OH (United States). Dept. of Agronomy); Sutton, P.; Dick, W.A. Dravo Lime Co., Pittsburgh, PA (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-91MC28060. (CONF-950106–2: 11. international symposium on use and management of coal combustion by-products (CCBs), Orlando, FL (United States), 15-19 Jan 1995). Order Number DE95008359. Source: OSTI; NTIS; GPO Dep.

Dry flue gas desulfurization (FGD) by-products are mixtures of coal fly-ash, anhydrite ($CaCO_4$), and unspent lime- or limestone-based sorbent. Dry FGD by-products frequently have neutralizing values greater than 50% $CaCO_3$ equivalency and thus have potential for neutralizing acidic soils. Owing to the presence of soluble salts and various trace elements, however, soil application of dry FGD by-products may have adverse effects on plant growth and soil quality. The use of a dry FGD by-product as a limestone substitute was investigated in a field study on three acidic agricultural soils (pH 4.6, 4.8, and 5.8) in eastern Ohio. The by-product (60% $CaCO_3$ equivalency) was applied in September, 1992, at rates of 0, 0.5, 1.0, and 2.0 times the lime requirement of the soils, and alfalfa (Medicago sativa L.) and corn (Zea mays L.) were planted. Soils were sampled immediately after FGD application and three more times every six months thereafter. Samples were analyzed for pH and water soluble concentrations of 28 elements. Soil pH was increased by all FGD rates in the zone of incorporation (0–10 cm), with the highest rates giving a pH slightly above 7. Within one year pH increases could be detected at depths up to 30 cm. Calcium, Mg, and S increased, and Al, Mn, and Fe decreased with increasing dry FGD application rates. No trace element concentrations were changed by dry FGD application except B which was increased in the zone of incorporation. Dry FGD increased alfalfa yield on all three soils, and had no effect on corn yield. No detrimental effects on soil quality were observed.

14752 (DOE/MC/29244–4038) **Disposal of fluidized bed combustion ash in an underground mine to control acid mine drainage and subsidence. Progress report, September 1, 1994–November 30, 1994.** West Virginia Univ., Morgantown, WV (United States). [1994]. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-94MC29244. Order Number DE95011400. Source: OSTI; NTIS; GPO Dep.

During Phase I (first 18 months) the project is segregated into four areas of reporting: (A) Grout Formulation, (B) Grout Characterization, (C) Water Quality Monitoring, (D) Subsidence Control & Contaminant Transport. The first component involves formulating a grout mixture with appropriate flowability and strength (flow and strength requirements will be set by other components) to be used in filling complex mine voids. The Grout Characterization component will determine the flowability characteristics of the formulated grout and model the flow of the grout filling the mine void. The Water Quality component involves background monitoring of water quality and precipitation at the Phase III (Longridge) mine site. The last component involves evaluating the strength requirements and the migration of contaminants through the candidate grouts. This report separately discusses progress on all components of the program in order of project subtask. The subtasks are arranged according to the Network Diagram on the following pages. Progress for each subtask can be seen in the Gantt Chart following the Network Diagram.

14753 (DOE/PC/89881–T12) **Microbial recovery of metals from spent coal liquefaction catalysts. Quarterly report, January–March, 1992.** Sperl, P.L.; Sperl, G.T. Geo-Microbial Technologies, Inc., Ochelata, OK (United States). [1992]. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89881. Order Number DE95009684. Source: OSTI; NTIS; GPO Dep.

During March the authors began the leaching of the extracted catalyst with denitrifying bacteria. The results are shown in the attached Figures. They found that the solvent has a great effect on the ability of the denitrifying bacteria to release the metals from the catalyst matrix, while the catalyst remains in whole particles. Subsequent to this they will test ground catalyst to determine if the solvent effects are real or not. It is possible that some solvents do a better job of removing surface poisoning materials from the catalyst, but if the catalyst is ground, the choice of solvent may not be as important. The results clearly show that Ni and Mo are rapidly released from solvent-washed spent catalyst by denitrifying bacteria. There also appears to be a predominant selectivity for Mo over Ni with most solvents as washing agents and whole catalyst particles. However, when the catalyst is crushed, this preference is not as pronounced. The net effect is probably a combination of the increase in surface area allowing better non-microbiological dissolution of the NiS as well as increasing the surface area exposed to the action of the microorganisms.

14754 (DOE/PC/89881–T13) **Microbial recovery of metals from spent coal liquefaction catalysts. Quarterly report, April–June, 1992.** Sperl, P.L.; Sperl, G.T. Geo-Microbial Technologies, Inc., Ochelata, OK (United States). [1992]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-89PC89881. Order Number DE95009685. Source: OSTI; NTIS; GPO Dep.

During April and May the authors began the rather laborious task of crushing each of the solvent-extracted catalyst samples for the determination of the effect of crushing on leaching rate and percent metal recovered. The crushing of these catalyst samples employed a ball mill and it took approximately 1 week to crush each sample. All catalyst samples, after crushing, were sieved to a particle size of >100 mesh. Samples of 10, and 40 mesh were also collected, but only the >100 mesh was subjected to bacterial leaching. These samples were tested using denitrifying bacteria for their ability to release Ni and Mo from these samples. The data are shown in the attached figures as well as comparisons for rates of Ni and Mo released in relation to catalyst solvent pretreatment. These data were obtained with citrate as a carbon and energy source for the microorganisms. It is quite clear that crushing the catalyst allows for a more rapid release of these metals from the catalyst samples, regardless of the organic solvent used to pretreat the catalyst. However, the effects of the different solvents are still evident, although not as striking, after the catalysts are crushed (see previous reports). There also still appears to be a greater ease in removing Mo over Ni, a case particularly prevalent if ethyl acetate, methanol or xylene is used as the pretreatment solvent. In any case, it appears that a variety of solvents will be useful and that an optimized system could yield >90% release and recovery of both Ni and Mo in as little as 10 days of treatment. Experimental data are enclosed.

14755 (DOE/PC/90362–T1-Vol.1) **Enhanced NO_x removal in wet scrubbers using metal chelates. Final report, Volume 1.** Smith, K. (Dravo Lime Co., Pittsburgh, PA (United States)); Lani, B.; Berisko, D.; Schultz, C.; Carlson, W.; Benson, L.B. Dravo Lime Co., Pittsburgh, PA (United States). Dec 1992. 86p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90362. Order Number DE95004263. Source: OSTI; NTIS; GPO Dep.

Successful pilot plant tests of simultaneous removal of $S0_2$ and NO_x in a wet lime flue gas desulfurization system were concluded in December. The tests, at up to 1.5 MW(e) capacity, were conducted by the Cincinnati Gas and Electric Company and Dravo Lime Company for the US Department of Energy at a pilot facility at the Miami Fort station of CG&E near Cincinnati, Ohio. The pilot plant scrubbed a slipstream of flue gas from Unit 7, a 530 MW coal-fired electric generating unit. Tests were conducted in three phases between April and December. The technology tested was wet scrubbing with Thiosorbic® magnesium-enhanced lime for $S0_2$ removal and simultaneous NO scrubbing with ferrous EDTA, a metal chelate. Magnesium-enhanced lime-based wet scrubbing is used at 20 full-scale high-sulfur coal-fired electric generating units with a combined capacity of 8500 NW. Ferrous EDTA reacts with

nitric oxide, NO, which comprises about 95% of NO_x from coal-fired boilers. In this report, although not precise, NO and NO_x are used interchangably. A major objective of the tests was to combine NO_x removal using ferrous EDTA, a developing technology, with SO_2 removal using wet lime FGD, already in wide commercial use. If successful, this could allow wide application of this NO_x removal technology.

14756 (DOE/PC/90364–T9) **Flue gas conditioning for improved particle collection in electrostatic precipitators. Third topical report, Results of performance testing of additives.** ADA Technologies, Inc., Englewood, CO (United States). 7 Apr 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90364. (ADA–4300-95-T3). Order Number DE95011397. Source: OSTI; NTIS; GPO Dep.

The purpose of this research program is to identify, evaluate, and develop cost-effective electrostatic precipitators (ESP) conditioning agents to improve removal of fine particle air toxics from coal-fired combustion flue gas streams. This goal can be met by reduction of reentrainment losses of collected ash and by control of ash resistivity. The project has focused on the development of cohesive agents to overcome reentrainment problems associated with low particle holding force. This effort has encompassed an extensive laboratory screening, followed by bench-scale and pilot-scale tests at the Consol research coal combustion facility. Initial laboratory screening with a variety of agents indicated qualitative improvements in ash layer mechanical characteristics. Further tests at the pilot-scale were inconclusive, in part because it was found to be difficult to develop low resistivity reentrainment conditions in the pilot-scale ESP available to the project. Results of the bench-scale and pilot-scale tests at Consol's coal combustor are presented in previous project reports.

14757 (DOE/PC/90547–T17) **Evaluation of gas-reburning and low NO_x burners on a wall fired boiler. Technical progress report number 17, October 1–December 31, 1994.** Energy and Environmental Research Corp., Irvine, CA (United States). 13 Dec 1994. 17p. Sponsored by USDOE, Washington, DC (United States);Gas Research Inst., Chicago, IL (United States);Colorado Interstate Gas Co., Colorado Springs, CO (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract FC22-91PC90547. Order Number DE95009351. Source: OSTI; NTIS; GPO Dep.

The primary objective of this CCT project is to evaluate the use of Gas Reburning and Low NO_x Burners (GR-LNB) for NO_x emission control from a wall fired boiler. Low NO_x burners are designed to delay the mixing of the coal fuel with combustion air to minimize the NO_x formation. With GR, about 80–85% of the coal fuel is fired in the main combustion zone. The balance of the fuel is added downstream as natural gas to create a slightly fuel rich environment in which NO_x is converted to N_2. The combustion process is completed by over fire air addition. SO_x emissions are reduced to the extent that natural gas replaces sulfur-containing coal. The level of NO_x reduction achievable with 15–20% natural gas is on the order of 50–60%. Thus the emission reduction target of the combination of these two developed technologies is about 70%. This project is being conducted in three phases at the host site, a 172 MW wall fired boiler of Public Service Company of Colorado (PSCo), Cherokee Unit 3 in Denver, Colorado: Phase 1–Design and Permitting; Phase 2–Construction and Start-up; and Phase 3–Operation, Data Collection, Reporting and Disposition. Phase 3 activities during this reporting period involved initiation of the second generation gas reburning parametric testing. This technology utilizes enhanced natural gas and overfire air injectors with elimination of the flue gas recirculation system. The objective is to demonstrate NO_x reductions similar to that of long term testing but with a reduced capital cost requirement through elimination of the FGR system.

14758 (DOE/PC/91293–13) **Direct catalytic decomposition of nitric oxide. Quarterly technical progress report No. 13, October–December 1994.** Flytzani-Stephanopoulos, M.; Sarofim, A.F.; Zhang, Yanping. Massachusetts Inst. of Tech., Cambridge, MA (United States). Dept. of Chemical Engineering. [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91293. Order Number DE95010500. Source: OSTI; NTIS; GPO Dep.

This project investigates a suitable catalyst system for direct NO decomposition in post-combustion gas streams. This process does not use a reductant, such as the ammonia used in Selective Catalytic Reduction (SCR) of NO_x to nitrogen. Therefore, it is a greatly simplified process involving passing the flue gas through a catalytic converter. Catalysts are prepared by incorporating metal cations into zeolite supports according to ion exchange procedures widely used in preparation of metal/zeolite catalysts. The catalysts of primary interest are copper, cerium, palladium, silver, and nickel exchanged ZSM-5 catalysts. Particular emphasis is given in this work on promoted Cu-ZSM-5 zeolites, especially the catalyst system Mg/Cu-ZSM-5, Ce/Cu-ZSM-5 and a few others, which are promising for NO conversion to nitrogen at typical flue gas 0_2 and NO levels and over the temperature range of 723–873K. The effect of zeolite modification, copper exchange level and catalyst preparation conditions on the catalyst activity are studied in a packed-bed microreactor. Kinetic studies of NO and 0_2 interaction with catalysts over a wide temperature range as well as catalyst structural investigations by STEM/EDX, XRD, and XPS are aimed at elucidating the role of cocation on the copper ion activity and stability in dry and wet reaction mixtures. During this quarter, the atomic ratios of copper, cerium, oxygen, and silicon on the surface of fresh, and used Cu-ZSM-5 and Ce/Cu-ZSM-5 catalysts were measured by x-ray-excited photoelectron spectroscopy (XPS). Dynamic change of copper with treatment of the samples was identified. Enrichment of copper was found in hydrated and steamed samples, while copper migrated into zeolite channels after the samples were heated in dry gas streams. Cerium was highly concentrated on the zeolite surface regions, and was much less mobile than copper.

14759 (DOE/PC/91336–T6) **Low temperature SO_2 removal with solid sorbents in a circulating fluidized bed absorber. Final report.** Lee, S.K.; Keener, T.C. Cincinnati Univ., OH (United States). Dept. of Civil and Environmental Engineering. 10 Oct 1994. 176p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91336. Order Number DE95009347. Source: OSTI; NTIS; GPO Dep.

A novel flue gas desulfurization technology has been developed at the University of Cincinnati incorporating a circulating fluidized bed absorber (CFBA) reactor with dry sorbent. The main features of CFBA are high sorbent/gas mixing ratios, excellent heat and mass transfer characteristics, and the ability to recycle partially utilized sorbent. Subsequently, higher SO_2 removal efficiencies with higher overall sorbent utilization can be realized compared with other dry sorbent injection scrubber systems.

14760 (DOE/PC/92534–7) **Selective catalytic reduction of sulfur dioxide to elemental sulfur. Quarterly technical progress report No. 7, January–March 1994.** Liu, Wei; Flytzani-Stephanopoulos, M.; Sarofim, A.F. Massachusetts Inst. of Tech., Cambridge, MA (United States). Dept. of Chemical Engineering. [1994]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92534. Order Number DE95010499. Source: OSTI; NTIS; GPO Dep.

Elemental sulfur recovery from $S0_2$-containing gas stream is highly attractive as it produces a salable product and no waste to dispose of However, commercially available schemes are complex and involve multistage reactors, such as, most notably in the Resox (reduction of $S0_2$ with coke) and Claus plant (reaction of $S0_2$ with H_2S over catalyst). This project will investigate a cerium oxide catalyst for the single stage selective reduction of $S0_2$ to elemental sulfur by a reductant, such as carbon monoxide. Cerium oxide has been identified in recent work at MIT as a superior catalyst for $S0_2$ reduction by CO to elemental sulfur because its high activity and high selectivity to sulfur over COS over a wide temperature range (400–650°C). The detailed kinetic and parametric studies of $S0_2$ reduction planned in this work over various CeO_2-formulations will provide the necessary basis for development of a very simplified process, namely that of a single-stage elemental sulfur recovery scheme from variable concentration gas streams. The potential cost- and energy-efficiency benefits from this approach can not be overstated. A first apparent application is treatment of a regenerator off-gases in power plants using regenerative flue gas desulfurization. Such a simple catalytic converter may offer the long-sought "Claus-alternative" for coal-fired power plant applications.

14761 (DOE/PC/92535–T9) **Control of coal combustion SO_2 and NO_x emissions by in-boiler injection of CMA. Final project report, July 1, 1992–December 31, 1994.** Levendis, Y.A. Northeastern Univ., Boston, MA (United States). [1995]. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92535. Order Number DE95009338. Source: OSTI; NTIS; GPO Dep.

A study was conducted to determine the efficacy of carboxylic calcium and magnesium salts (e.g., calcium magnesium acetate or CMA, $CaMg_2(CH_2COOH)_6$) for the simultaneous removal of SO_2 and NO_x in oxygen-lean atmospheres. Experiments were performed in a high-temperature furnace that simulated the post-flame environment of a coal-fired boiler by providing similar temperatures and partial pressures of SO_2, NO_x CO_2 and O_2. When injected into a hot environment, the salts calcined and formed highly porous "popcorn"-like cenospheres. Residual MgO and/or $CaCO_3$ and CaO reacted heterogeneously with SO_2 to form $MgSO_4$ and/or $CaCO_4$. The organic components - which can be manufactured from wastes such as sewage sludge - gasified and reduced $NO_x$to N_2 efficiently if the atmosphere was moderately fuel-rich. Dry-injected CMA particles at a Ca/S ratio of 2, residence time of 1 second and bulk equivalence ratio of 1.3 removed over 90% of SO_2 and NO_x at gas temperatures $\geq$ 950°C. When the furnace isothermal zone was $\leq$ 950°C, Ca was essentially inert in the furnace quenching zone, while Mg continued to sorb SO_2 as the gas temperature cooled at a rate of -130°C/sec. Hence, the removal of SO_2 by CMA could continue for nearly the entire residence time of emissions in the exhaust stream of a power plant. Additional research is needed to improve the efficiency and reduce the cost of the relatively expensive carboxylic acid salts as dual SO_2-NO_x reduction agents. For example, wet injection of the salts could be combined with less expensive hydrocarbons such as lignite or even polymers such as poly(ethylene) that could be extracted from the municipal waste stream.

14762 (DOE/PC/92548–T9) **Suppression of fine ash formation in pulverized coal flames. Quarterly technical progress report No. 9, October 1, 1994–December 31, 1994.** Kramlich, J.C.; Chenevert, B.; Park, Junesung. Washington Univ., Seattle, WA (United States). Dept. of Mechanical Engineering. 1 Mar 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92548. Order Number DE95010633. Source: OSTI; NTIS; GPO Dep.

The goals of the present program are threefold. First, the authors wish to perform measurements on carefully characterized coals to identify the means by which the coal treatment increases aerosol yields. Second, the authors investigate means by which coal cleaning can be done in a way that will not increase aerosol yields. Finally, the authors identify whether this mechanism can be used to reduce aerosol yields from systems burning straight coal.

14763 (OCDO–95010443) **Direct sulfur recovery during sorbent regeneration. Final report.** Nelson, S.G. (Sorbent Technologies Corp., Twinsburg, OH (United States)); Little, R.C. Ohio Coal Development Office, Columbus, OH (United States); Sorbent Technologies Corp., Twinsburg, OH (United States). Aug 1993. 50p. Sponsored by Ohio State Government, Columbus, OH (United States). Source: OSTI; Ohio Coal Development Office, 77 S. High Street, P.O. Box 1001, Columbus, OH 43266-001 (United States).

The objective of this research project was to improve the direct elemental sulfur yields that occur during the regeneration of SO_2-saturated MgO-vermiculite sorbents (MagSorbents) by examining three approaches or strategies. The three approaches were regeneration-gas recycle, high-pressure regeneration, and catalytic reduction of the SO_2 gas using a new catalyst developed by Research Triangle Institute (RTI). Prior to the project, Sorbent Technologies Corporation (Sorbtech) had developed a sorbent-regeneration process that yielded directly a pure elemental sulfur product. In the process, typically about 25 to 35 percent of the liberated $S0_2$ was converted directly to elemental sulfur. The goal of this project was to achieve a conversion rate of over 90 percent. Good success was attained in the project. About 90 percent or more conversion was achieved with two of the approaches that were examined, regeneration-gas recycle and use of the RTI catalyst. Of these approaches, regeneration-gas recycle gave the best results (essentially 100 percent conversion in some cases). In the regeneration-gas recycle approach, saturated sorbent is simply heated to about 750°C in a reducing gas (methane) atmosphere. During heating, a gas containing elemental sulfur, water vapor, H_2S, $S0_2$, and $C0_2$ is evolved. The elemental sulfur and water vapor in the gas stream are condensed and removed, and the remaining gas is recycled back through the sorbent bed. After several recycles, the $S0_2$ and H_2S completely disappear from the gas stream, and the stream contains only elemental sulfur, water vapor and $C0_2$.

14764 (BARC–1994/E/034) **Composition and leachability of trace elements in coal ash and their migration in ground water at thermal power plant site at Manuguru.** Sadasivan, S. (Bhabha Atomic Research Centre, Bombay (India). Environmental Assessment Div.); Meenakshy, V.; Negi, B.S.; Nair, R.N.; Krishnamoorthy, T.M.; Nambi, K.S.V. Bhabha Atomic Research Centre, Bombay (India). 1994. 57p. Order Number DE95627842. Source: OSTI; NTIS (US Sales Only); INIS.

The Heavy Water Board at Manuguru has a captive power plant using 2500 tpd of coal producing about 1000 tpd of ash. The possible toxic metal contamination of ground water due to leaching of the ash (so that toxic elements do not seep through one pond and contaminate the ground water) are assessed. Samples of coal, fly ash, bottom ash, ash pond overflow water, river water, ash pond slurry, soil (surface and depth) were analysed for major and trace element contents using EDXRF, INAA, AAS, and Anodic Stripping Voltammetry. The cation exchange capacity of the underlying soil and the fly ash were determined by standard method using calcium as the cation indicator. The redox potential and the pH of the samples were measured by using Pt/Mo and glass/calomel system respectively. The size distribution of fly ash particles were also determined. The study conclusively shows that the leach percent being very small and the soil having good cation exchange capacity there is negligible probability of contamination of ground water from ash pond and therefore there is no dire need for providing any impervious lining for the ash pond. (author). 23 refs., 19 tabs., 16 figs., 1 appendix.

14765 (ETDE-DE–75) **Reconstruction and recultivation in the Lausitz brown coal district. Ecological aims and economical chances.** Reihe 'Wirtschaftspolitische Diskurse', v. 60. Forschungsinstitut der Friedrich-Ebert-Stiftung e.V., Bonn (Germany). Abt. Wirtschaftspolitik. Aug 1994. 41p. (In German). (CONF-9405306–: Technical conference on reconstruction, recultivation and subsequent use of open-cast mining surfaces, Ruhland (Germany), 31 May 1994). Order Number DE95768933. Source: OSTI; NTIS (US Sales Only).

Even as recently as in 1988, 310 million tonnes of brown coal were extracted in what was then the German Democratic Republic. Environmental pollution and nature destruction on a scale hardly imaginable were the consequences of such aggressive and recklessly extended mining. - After 1989, brown coal extraction decreased dramatically. In the Lausitz district, whose economic structure depended entirely on coal and which became the energy center of the former GDR, coal extraction and mining activities have more than halved during the last four years. - The remediation of landscape destruction and land pollution from mining must now be accompanied by thorough structural change. Exhausted open-pit mines and residual depressions must be freed from contaminants, cleaned up and revegetated; in destroyed landscapes an efficient natural cycle must be re-established. The reclaimed mining sites will be turned into areas with stands of mixed forest and wet biotopes, but also lakes and recreation areas. Beyond ecological regeneration and landscape reconstruction, the redevelopment and revegetation work possesses considerable employment potential for the foreseeable period of time. Herein lies a chance for overcoming the consequences of the brown coal monostructure and developing a viable industry and dynamic trade. (orig.)

14766 (IAEA-TECDOC–787) **Guidelines for comparative assessment of the environmental impacts of wastes from electricity generation systems. A framework for the assessment and comparison of environmental impacts.** International Atomic Energy Agency, Vienna (Austria). Feb 1995. 61p. Order Number DE95627817. Source: OSTI; NTIS (US Sales Only); INIS.

The report describes the initial phase of a project intended to provide guidance to those concerned with environmental aspects of solid and hazardous waste management in electrical energy production systems. The focus is on describing a methodology for assessing and comparing the environmental impact arising from these wastes, and thereby to provide an input to overall electrical generation comparison projects, such as DECADES. The structure of the report is as follows: after considering a range of electrical energy production systems with an outline discussion of the waste streams produced in each case, the relevant treatment technologies and disposal options are reviewed. Then the elements of the framework for comparative assessment proposed in this report are described. The types of environmental impact, environmental protection criteria and indicators or end-points to measure the impact, the way in which such impacts can be quantitatively assessed and compared are discussed. 59 refs, figs and tabs.

14768 (ETDE-DE–65) **Development and testing of an automatic coupling/uncoupling system for mine cars in view of reducing accident risks and manual workload. Final report.** Urbainczyk, W. Ruhrkohle Niederrhein AG/Ruhrkohle Westfalen AG, Herne (Germany). Mar 1994. 82p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 01HD107. Order Number DE95769225. Source: OSTI; NTIS (US Sales Only).

The development of an automatic coupling/uncoupling device for all shackle-type couplings which clutches the couplings and, without stopping the train, runs the coupling by microprocessor control on the train in motion, is to create the prerequisites for humanization of the highly risk-laden work of the shunter in charge of coupling/uncoupling. One prototype of a coupling and one prototype of an uncoupling device were designed and built. Subsequent to rig tests with the manufacturer, both devices were installed on Walsum colliery, and tested. The result was unsatisfactory for the uncoupling device. The result of the coupling device test was better but, also in this case, further amendments are necessary to arrive at operational reliability. (orig.)

14770 (ANL/DIS/TM–22) **Coal use in the People's Republic of China, Volume 2: The economic effects of constraining coal utilization.** Rose, A. (Pennsylvania State Univ., University Park, PA (United States). Dept. of Mineral Economics); Lim, D.; Frias, O.; Benavides, J.; Tompkins, M.M. Argonne National Lab., IL (United States). Dec 1994. 168p. DOE Contract W-31109-ENG-38. Order Number DE95008349. Source: OSTI; NTIS; GPO Dep.

The People's Republic of China (hereafter referred to as China) is the largest producer and consumer of coal in the world. The dominance of coal in China's energy balance has come at a high price to the environment. With the recent attention given to global warming issues, China's energy consumption and production practices have become the subject of much concern. Of particular concern is China's ability to reduce CO_2 emissions by constraining coal use and the impact such policies will likely have on the Chinese economy. The study is divided into two reports. Volume 1 focuses on the full coal fuel cycle, emissions, and environmental effects. This report (Volume 2) analyzes various CO_2 mitigation strategies and determines their effect on economic growth. Contrary to what some analysts have claimed, the current work suggests that it would not be costly for the Chinese to reduce CO_2 emissions. In fact, some strategies were accompanied by increases in China's energy and economic efficiency, which actually stimulated economic growth.

14771 (DOE/ET/15601–T69) **Multi-color pyrometer temperature measurement system. Topical report 10.** Green, R.A.; Philip, T. Mississippi State Univ., MS (United States). Diagnostic Instrumentation and Analysis Lab. [1995]. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-80ET15601. Order Number DE95009825. Source: OSTI; NTIS; GPO Dep.

The Multi-Color Pyrometer System is one of the advanced optical diagnostic instruments developed at DIAL to measure temperatures in the coal combustion environments of large scale facilities. The principles of operation, a description of the system and its capabilities, and the operational details of this instrument are presented in this report.

14772 (DOE/MC/24132–4026) **Tidd PFBC demonstration project: Technical progress report, third quarter 1994.** American Electric Power Service Corp., Columbus, OH (United States). Oct 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-87MC24132. Order Number DE95010528. Source: OSTI; NTIS; GPO Dep.

This is the 30th Technical Progress Report submitted to the Department of Energy in connection with the Cooperative Agreement between the DOE and the Ohio Power Company for the Tidd PFBC Demonstration Plant. This report covers the period from July 1, 1994 to September 30, 1994. Major activities during this period include: the unit operated for 1,214 hours on coal, bringing the grand total for coal fire through the end of the quarter to 9,061 hours; the unit availability for the first three quarters was 54.9%; there were six gas turbine starts, seven bed preheater starts, and six operating periods on coal; during this quarter, total gross generation was 50,416 MWH, the peak unit output for one hour was 59 MWH, and the coal consumption was 26,705 tons; fifteen performance tests were conducted during this quarter. Major activities planned for the next period include: continuation of sorbent utilization tests at various bed levels and sulfur retention values; and operation of the unit at higher loads as the ambient temperatures decline, allowing for higher air flow from the gas turbine compressor. Design and permitting, project support, operations, maintenance, manpower, and cost data are discussed.

14773 (DOE/MC/27229–4002) **Pulsed atmospheric fluidized-bed combustion. Quarterly report, October–December 1994.** Thermochem, Inc., Columbia, MD (United States). Jan 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-90MC27229. Order Number DE95000071. Source: OSTI; NTIS; GPO Dep.

Minor changes were made in the steam/water pressure pipe routing from and to boiler shell, to accommodate the bed module orientation change. The ash silo pad elevation was lowered to match the nearest access road level. Grounding system drawing was revised. Foundation work was completed December 31, 1994.

14774 (DOE/MC/29257–4005) **Advanced Turbine Systems program conceptual design and product development. Quarterly report, February–April 1994.** Allison Engine Co., Indianapolis, IN (United States). Feb 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC29257. Order Number DE95000077. Source: OSTI; NTIS; GPO Dep.

Task 8.5 (active clearance control) was replaced with a test of the 2600F prototype turbine (Task 8.1T). Test 8.1B (Build/Teardown of prototype turbine) was added. Tasks 4 (conversion of gas-fired turbine to coal-fired turbine) and 5 (market study) were kicked off in February. Task 6 (conceptual design) was also initiated. Task 8.1 (advanced cooling technology) now has an approved test plan. Task 8.4 (ultra low NOx combustion technology) has completed the code development and background gathering phase. Task 8.6 (two-phase cooling of turbine vanes) is proceeding well; initial estimates indicate that nearly 2/3 of required cooling flow can be eliminated.

14775 (DOE/MT/92021–9) **Analysis/control of in-bed tube erosion phenomena in the fluidized bed combustion (FBC) system. Technical progress report No. 9, [October 1, 1994–December 31, 1994].** Lee, Seong W. Morgan State Univ., Baltimore, MD (United States). School of Engineering. Jan 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92MT92021. Order Number DE95010473. Source: OSTI; NTIS; GPO Dep.

This technical report summarizes the research work performed and progress achieved during the period of October 1, 1994 to December 31, 1994. The characteristics of anti-erosion remedies and mechanism for in-bed in FBC were discussed to provide the basic design guidelines for anti-erosion devices. One of the anti-erosion remedies currently operate the basic principle of creating a protective stagnant layer of solids to against incoming high velocity of solid particles. This stagnant layer of solid is goal of breaking up the local flow patterns at eroding tube surfaces. This principle is embodied by designing of antierosion studs, pins, fins, and baffles. By attaching a number of studs with a sufficient stud-to-stud distance to avoid the bridging of solid particles, tube wastage can be retarded to prolong the boiler tube life. These devices will be used for the measurement of material wastage in the laboratory-scale FBC.

14776 (DOE/PC/90155–T7) **Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, April 1992–June 1992.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1992]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90155. (MTCI–10050-07). Order Number DE95011470. Source: OSTI; NTIS; GPO Dep.

The objective of this Phase III program for the development of a commercial-scale, coal-fired combustion system is to develop and integrate all system components from fuel through total system controls building upon the prior Phase I and II development accomplishments of the MTCI pulse combustion technology and to then field test the complete system in order to evaluate its potential marketability. During this seventh quarter, the natural gas screening tests were successfully completed with turndown operation from 5.6 to 1.5 MMBtu. Some difficulty due to inadequate mixing at high excess air levels at the low firing rate were experienced and a type V injector was installed and utilized successfully. The pulse combustor tailpipe configuration has been slightly modified. The tailpipe has been changed from multi-pipe (three pipes) to single pipe in order to keep the tailpipe section in high temperature zone by reducing the heat transfer surface. A fluidized bed was designed for mixing and fluidizing coal and limestone to provide a more uniform and continuous feed rate. The fluidized bed will be installed between the Y-connection of the exits of the rotary valves and the venturi eductor.

14777 (DOE/PC/90155–T8) **Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, July 1992–September 1992.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1992]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90155. (MTCI–10050-08). Order Number DE95011471. Source: OSTI; NTIS; GPO Dep.

The objective of this Phase III program for the development of a commercial-scale, coal-fired combustion system is to develop and integrate all system components from fuel through total system controls building upon the prior Phase I and II development accomplishments of the MTCI pulse combustion technology and to then field test the complete system in order to evaluate its potential marketability. During this 8th quarter, shakedown testing on coal for preparation for preliminary system testing was completed. Limestone and coal feed subsystems were calibrated. Some modifications to the injectors and other components were completed and a malfunction of the control system was analyzed and modifications (repairs) accomplished.

14778 (DOE/PC/90155–T9) **Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, October 1992–December 1992.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1992]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90155. (MTCI–10050-09). Order Number DE95011472. Source: OSTI; NTIS; GPO Dep.

The overall objective of this Phase III for the Development and Testing of a Commercial-Scale, Coal-Fired Combustion System is to demonstrate and analyze the performance of a fully integrated system at the 5 to 6 MMBtu level to evaluate its potential marketability. The application assumes the availability of both a coal-based fuel and the equipment required to deliver such fuel to a building, store it within the building or in a storage container or tank adjacent to the building, and transport it from storage to the burner. The fuel is delivered and stored either in the form of a coal-water fuel or as a dry powder. During this 9th quarter, preparations for initiating the preliminary systems tests were conducted. Some repairs and modifications to the system were completed and the system went through some initial shakedown testing.

14779 (DOE/PC/90155–T10) **Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, January 1993–March 1993.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1992]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90155. (MTCI–10050-10). Order Number DE95011473. Source: OSTI; NTIS; GPO Dep.

The objective of this Phase III program for the development of a commercial-scale, coal-fired combustion system is to develop and integrate all system components from fuel through total system controls building upon the prior Phase I and II development accomplishments of the MTCI pulse combustion technology and to then field test the complete system in order to evaluate its potential marketability. During this 10th quarter, a series of five shakedown tests were performed after the modifications indicated by the initial set of coal-fired tests were completed. The firing rate of the combustion system utilizing natural gas was gradually ramped up to cure the refractory on the boiler extension section. The pulse combustor operation was stable for a variation in coal firing rate from 1.8 to 7.5 MMBtu/hr, indicating a nominal 4:1 turndown capability. The pressure oscillations were robust and the sound pressure level (SPL) varied from 161 to 178 dB with an increase in firing rate. The wave form was near sinusoidal with very low harmonics. The combustion space-heating system was operated for over 100 hours during this period to acquire system characterization test data.

14780 (DOE/PC/90155–T11) **Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, April 1993–June 1993.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1993]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90155. (MTCI–10050-11). Order Number DE95011474. Source: OSTI; NTIS; GPO Dep.

The objective of this Phase III program for the development of a commercial-scale, coal-fired combustion system is to develop and integrate all system components from fuel through total system

controls building upon the prior Phase I and II development accomplishments of the MTCI pulse combustion technology and to then field test the complete system in order to evaluate its potential marketability. The component, system and proof-of-concept test program will be conducted at the MTCI development facility in Baltimore, Maryland. Steady-state tests will be performed to determine combustion efficiency, sulfur capture efficiency, gaseous and particulate emissions, thermal efficiency and turndown ratio of the system as a function of several variables. During this 11th quarter, preliminary system screening tests were initiated and indicated a need to modify the swirler; reduce heat loss from the Morrison tube; and insert additional piping at the entrance to the partition disk to enhance residence time for burnout. Additional test runs were made after the modifications were completed. The tests provided a comparison of performance with and without the addition of sorbent.

14781 (DOE/PC/90155–T12) **Development and testing of commercial-scale, coal-fired combustion systems, Phase 3, Technical progress report, July 1993–September 1993.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1993]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90155. (MTCI–10050-12). Order Number DE95011475. Source: OSTI; NTIS; GPO Dep.

The objective of this Phase III program for the development of a commercial-scale, coal-fired combustion system is to develop and integrate all system components from fuel through total system controls building upon the prior Phase I and II development accomplishments of the MTCI pulse combustion technology and to then field test the complete system in order to evaluate its potential marketability. During this 12th quarter, preliminary system tests were completed and approval to initiate proof-of-concept (POC) tests was provided. A test plan for the proof-of-concept tests was prepared and provided to the DOE. The first two POC tests planned were conducted after facility modifications were completed. The NO_x emissions were much higher than anticipated. Continued POC testing was therefore deferred until an analysis of the system and any planned modifications to resolve this issue are completed.

14782 (DOE/PC/90155–T14) **Development and testing of commercial-scale, coal-fired combustion systems, Phase 3, January 1994–March 1994.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90155. (MTCI–10050-14). Order Number DE95011477. Source: OSTI; NTIS; GPO Dep.

The objective of this Phase III program for the development of a commercial-scale, coal-fired combustion system is to develop and integrate all system components from fuel through total system controls building upon the prior Phase I and II development accomplishments of the MTCI pulse combustion technology and to then field test the complete system in order to evaluate its potential marketability. The component, system and proof-of-concept test program will be conducted at the MTCI development facility in Baltimore, Maryland. Steady-state tests will be performed to determine combustion efficiency, sulfur capture efficiency, gaseous and particulate emissions, thermal efficiency and turndown ratio of the system as a function of several variables. The parameters to be investigated include: firing rate (1 to 5 MMBtu/hr), multiple air staging (different stoichiometries in the primary, secondary and tertiary air addition zones), Ca/S molar ratio (1 to 3), fuel type (natural gas, 3 different coals), and sorbent During this 14th quarter, the modifications to the system were completed and preparations for continuing the proof-of-concept testing were initiated.

14783 (DOE/PC/90155–T15) **Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, April 1994–June 1994.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1994]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90155. (MTCI–10050-15). Order Number DE95011478. Source: OSTI; NTIS; GPO Dep.

The objective of this Phase III program for the development of a commercialscale, coal-fired combustion system is to develop and integrate all system components from fuel through total system controls building upon the prior Phase I and II development accomplishments of the MTCI pulse combustion technology and to then field test the complete system in order to evaluate its potential marketability. The component, system and proof-of-concept test program will be conducted at the MTCI development facility in Baltimore, Maryland. Steady-state tests will be performed to determine combustion efficiency, sulfur capture efficiency, gaseous and particulate emissions, thermal efficiency and turndown ratio of the system as a function of several variables. During this 15th quarter, all of the repairs and modifications resulting from the critical testing last period were completed and additional shakedown testing was initiated. After some additional fixes to the feed system to obtain representative ash samples for analysis, a series of tests were conducted to evaluate sulfur capture; NO_x reduction; combustion efficiency and to confirm repeatability.

14784 (DOE/PC/90155–T16) **Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, July 1994–September 1994.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1994]. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90155. (MTCI–10050-16). Order Number DE95011479. Source: OSTI; NTIS; GPO Dep.

The objective of this Phase III program for the development of a commercial-scale, coal-fired combustion system is to develop and integrate all system components from fuel through total system controls building upon the prior Phase I and II development accomplishments of the MTCI pulse combustion technology and to then field test the complete system in order to evaluate its potential marketability. During this 16th quarter, a series of tests were carried out in preparation for a 48-hour test to collect complete performance data of the unit. These tests indicated that some modifications would be required to improve overall performance. The modifications were completed and the 48-hour test conducted. At this point in time, the unit has acquired over 350 hours of operations at firing rates from 2.6 – 6.7 MMBtu/hr with no fouling of the tubes apparent. NO_xemissions ranged from .2 to .3 lbs/MMBtu, stack particulates were less than .01 lbs/MMBtu and a combustion efficiency greater than 99 percent achieved.

14785 (DOE/PC/90155–T17) **Development and testing of commercial-scale, coal-fired combustion systems: Phase 3, Technical progress report, October 1994–December 1994.** Manufacturing and Technology Conversion International, Inc., Columbia, MD (United States). [1994]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90155. (MTCI–10050-17). Order Number DE95011480. Source: OSTI; NTIS; GPO Dep.

The objective of this Phase III program for the development of a commercial-scale, coal-fired combustion system is to develop and integrate all system components from fuel through total system controls building upon the prior Phase I and II development accomplishments of the MTCI pulse combustion technology and to then field test the complete system in order to evaluate its potential marketability. During this 17th quarter, the Demonstration Test Plan was approved and initial demonstration tests conducted. The results of these initial tests confirmed the performance of the pulse combustion system with the data collected similar to that previously reported, indicating good repeatability.

14786 (DOE/PC/90165–T5) **Utilization of coal-water fuels in fire-tube boilers. Final report, October 1990–August 1994.** Sommer, T.; Melick, T.; Morrison, D. Energy and Environmental Research Corp., Irvine, CA (United States). [1994]. 254p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90165. Order Number DE95007543. Source: OSTI; NTIS; GPO Dep.

The objective of this DOE sponsored project was to successfully fire coal-water slurry in a fire-tube boiler that was designed for oil/gas firing and establish a data base that will be relevant to a large number of existing installations. Firing slurry in a fire-tube configuration is a very demanding application because of the extremely high heat release rates and the correspondingly low furnace volume where combustion can be completed. Recognizing that combustion efficiency is the major obstacle when firing slurry in a

fire-tube boiler, the program was focused on innovative approaches for improving carbon burnout without major modifications to the boiler. The boiler system was successfully designed and operated to fire coal-water slurry for extended periods of time with few slurry related operational problems. The host facility was a 3.8 million Btu/hr Cleaver-Brooks fire-tube boiler located on the University of Alabama Campus. A slurry atomizer was designed that provided outstanding atomization and was not susceptible to pluggage. The boiler was operated for over 1000 hours and 12 shipments of slurry were delivered. The new equipment engineered for the coal-water slurry system consisted of the following: combustion air and slurry heaters; cyclone; baghouse; fly ash reinjection system; new control system; air compressor; CWS/gas burner and gas valve train; and storage tank and slurry handling system.

14787 (DOE/PC/90286–T8) **Combustion fume structure and dynamics. Period of performance: 8/16/91–2/15/92.** Flagan, R.C. California Inst. of Tech., Pasadena, CA (United States). [1992]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-90PC90286. Order Number DE95009683. Source: OSTI; NTIS; GPO Dep.

During pulverized coal combustion, a fume of submicron particles is formed when minerals that have volatilized from the parent coal nucleate to form new particles. The particles thus generated are extremely small, but they grow rapidly due to Brownian coagulation. Much has been learned about these fine particles in experimental studies of the particles formed in coal combustion. Measurements of the variation of chemical composition with particle size clearly demonstrate that the particles smaller than about 0.1 μm in diameter are formed from vapors while larger particles are dominated by residues from the mineral matter in the coal. Theoretical predictions of the evolution of the particle size distribution suggest that the nuclei should produce a sharp peak which may approach 0.1 μm, but they are unlikely to grow much beyond that size in the limited time available in practical combustors. The focus of this research program is on elucidating the fundamental processes that determine the particle size distribution, composition, and agglomerate structures of coal ash fumes. The ultimate objective of this work is the development and validation of a model for the dynamics of combustion fumes, describing both the evolution of the particle size distribution and the particle morphology. The study employs model systems to address the fundamental questions and to provide rigorous validation of the models to be developed. This first phase of the project has been devoted to the development of a detailed experimental strategy that will allow agglomerates with a broad range of fractal dimensions to be studied in the laboratory.

14788 (DOE/PC/91292–T13) **Rheological properties essential for the atomization of Coal Water Slurries (CWS). Quarterly progress report, September 15, 1994–December 15, 1994.** Ohene, F. Grambling State Univ., LA (United States). Dept. of Chemistry. [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91PC91292. Order Number DE95009344. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to perform experiments to understand the effect of high shear and extensional properties on the atomization of coal-water slurries (CWS). In the atomization studies, the mean drop size of the CWS sprays will be determined at various air-to-CWS. A correlation between the extensional and high shear properties, particle size distributions and the atomization will be made in order to determine the influence of these parameters on the atomization of CWS.

14789 (DOE/PC/94203–T1) **Interactions between trace metals, sodium and sorbents in combustion. Quarterly report No. 1, October 1, 1994–December 31, 1994.** Wendt, J.O.L. Arizona Univ., Tucson, AZ (United States). Dept. of Chemical Engineering. 22 Feb 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94203. Order Number DE95010631. Source: OSTI; NTIS; GPO Dep.

The proposed research is directed at an understanding of how to exploit interactions between sodium, toxic metals and sorbents, in order to optimize sorbents injection procedures, which can be used to capture and transform these metals into environmentally benign forms. The research will use a 17kW downflow, laboratory combustor, to yield data that can be interpreted in terms of fundamental kinetic mechanisms. Metals to be considered are lead, cadmium, and arsenic. Sorbents will be kaolinite, bauxite, and limestone. The role of sulfur will also be determined. The research is divided into five tasks: Task 1, combustor modifications; Task 2, screening experiments; Task 3, mechanisms; Tasks 4, applications; and Task 5, mathematical modelling. Work on this research grant has commenced, with efforts on Task 1 (Combustor Modifications) and on Task 5 (Mathematical Modelling).

14790 (DOE/EIA–0543(94/4Q)) **U.S. energy industry financial developments: 1994 Fourth quarter.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. Apr 1995. 21p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010321. Source: OSTI; NTIS; GPO; GPO Dep.

This report traces key developments in US energy companies' financial performance for the fourth quarter of 1994. Financial data (only available for publicly-traded US companies) are included in two broad groups–fossil fuel production and rate-regulated utilities. All financial data are taken from public sources such as corporate reports and press releases, energy trade publications, and The Wall Street Journal's Earnings Digest. Return on equity is calculated from data available from Standard and Poor's Compustat data service. Since several major petroleum companies disclose their income by lines of business and geographic area, these data are also presented in this report. Although the disaggregated income concept varies by company and is not strictly comparable to corporate income, relative movements in income by lines of business and geographic area are summarized as useful indicators of short-term changes in the underlying profitability of these operations. 6 figs, 5 tabs.

AN SSSR, Moscow (Russian Federation). 1994. 4p. (In Russian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627070. Source: OSTI; NTIS (US Sales Only); INIS.

The authors describe a new direction of efficient coal gasification in aerohydroslag melt that offers low emissions of SO_2, NO_2 and particulates even in large-scale facilities as well as conversion of residues in saleable byproducts. The new technology is developed at the Nesvetaj GRES pilot plant (RU). The gasification is carried out in turbulent mixed emulsion of fuel and liquid slag (heat carrier). Vapour-oxygen gas is introduced under excess pressure into slag melt and creates gas-saturated layer of heterogenous melt consisting of coal slag and lime. As a result in-depth coal separation and

gasification takes place. The NO_x emissions from the melt are reduced to 40-60 mg/nm^3, and after reheating (combustion chamber) - to 100-150 mg/nm^3. The sulfur oxides emissions are reduced to 25-50%. The degree of coal-derived ash capture in the slag melt reaches the record value of 99.5%. The light slag from the top of the melt is utilised for building materials, and the heavy polymetallic slag is processed in metallurgy. Besides having the positive environmental benefit of meeting the stringent ecological requirements, the proposed system has high technological efficiency. (orig.).

A methodology is proposed for assessment of economical and environmental efficiency of thermal power plants. It is based on balance principle taking into account the balance of row materials and energy expressed by quantitatively comparable criteria. The main criteria for evaluation of damages caused by TPP is the generally accepted factor of overall efficiency. The assessment obtained are complex and easy-to-implement as the balances are expressed in financial and energetic equivalents. The methodology is supported by a computer program. The expenses for environmental protection and compensation of losses are included in the capital expenditures. The importance of human factor related expenses is stressed also. The minimal overall expenditures at maximal overall efficiency correspond to an optimal variant of stable production. The proposed methodology is universal and could be applied in different industrial systems. Its application is illustrated on the example of the Maritsa-Iztok TPP, Dimitrovgrad (BG). 5 figs. (orig.).

14795 (LA-UR–95-624) **An evaluation of commercialization mechanisms for the Clean Coal Technology Program.** Joyce, E.L. Jr.; Matysiak, L.M.; Wampler, J.A. Los Alamos National Lab., NM (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95007856. Source: OSTI; NTIS; GPO Dep.

The Clean Coal Technology (CCT) Program is an exemplary model of a successful collaboration between industry and government to develop advanced clean coal technologies that will both sustain and expand coal usage for electrical power production and materials manufacturing. Begun in 1985, the program has included five national competitive solicitations over a period of nine years. These solicitations have resulted in forty-five projects covering twenty-one states with a total capital investment of almost $7 billion. The goal of the program has been to demonstrate the next generation of advanced coal based technologies and to transfer these technologies to individual companies in the domestic and international market place. This study was commissioned by the CCT Program to evaluate technology transfer mechanisms used in other programs that can be used to stimulate the commercialization of the CCT Program's technologies. Los Alamos National Laboratory (LANL) was selected for this task because of its involvement in the Natural Gas and Oil Technology Partnership, which is sponsored by the DOE Office of Fossil Energy. The mission of the Partnership is to coordinate the development and transfer of technologies developed at DOE national laboratories to the U.S. petroleum industry. The intent of this study is to examine the structure of the Partnership and evaluate the applicability of this structure to the CCT Program.

14796 (NEDO-C–9329) **Feasibility survey of the environmental harmony type coal utilization system. Case in Indonesia.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Jun 1994. 206p. (In Japanese). Order Number DE95769803. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

A survey was made on the coal utilization system in terms of environmental policies and improvement of efficiency in coal utilization in Indonesia. There are now three coal-fired power plants run by the governmental electric power corporation in Indonesia, PLN. A total power generation capacity of the three plants is 2.53 million kW, all of which are from combustion of pulverized coal. A special feature is that the design of flue gas treatment facilities is simple, only electrostatic precipitator, on condition that high volatile matter and low sulfur (0.3-0.5%) coal in Indonesia is used. As capacity of power plants increases hereafter, it seems to be needed to take measures against emissions of SOx and NOx and highly increase efficiency. In addition, there are presently problems on dust collectability and scattering of fly ash, and measures for solution to these problems are needed. Cement plants are comparatively new and have positively promoted reconstruction of the equipment for energy conservation. Also they are high in energy efficiency and are tackling the problem on the dust. Therefore, the cement industry is full in activity for solution to the environmental problem. It is needed to produce smokeless and odorless private-use briquette and establish combustion technology. 49 figs., 64 tabs.

14797 (DOE/BC–95/5/SP) **Oil program implementation plan FY 1996–2000.** USDOE Bartlesville Project Office, OK (United States). Apr 1995. 150p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95000139. Source: OSTI; NTIS; GPO Dep.

This document reaffirms the US Department of Energy (DOE) Office of Fossil Energy commitment to implement the National Oil Research Program in a way to maximize assurance of energy security, economic growth, environmental protection, jobs, improved economic competitiveness, and improved US balance of trade. There are two sections and an appendix in this document. Section 1 is background information that guided its formulation and a summary of the Oil Program Implementation Plan. This summary includes mission statements, major program drivers, oil issues and trends, budget issues, customers/stakeholders, technology transfer, measures of program effectiveness, and benefits. Section 2 contains more detailed program descriptions for the eight technical areas and the NIPER infrastructure. The eight technical areas are reservoir characterization; extraction research; exploration, drilling, and risk-based decision management; analysis and planning; technology transfer; field demonstration projects; oil downstream operations; and environmental research. Each description contains an overview of the program, descriptions on main areas, a discussion of stakeholders, impacts, planned budget projections, projected schedules with Gantt charts, and measures of effectiveness. The appendix is a summary of comments from industry on an earlier draft of the plan. Although changes were made in response to the comments, many of the suggestions will be used as guidance for the FY 1997–2001 plan.

Colorado School of Mines, Golden, CO (United States). Dept. of Petroleum Engineering. 27 Jan 1995. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14891. Order Number DE95010464. Source: OSTI; NTIS; GPO Dep.

This DOE research project was established to document the integrated team approach for solving reservoir engineering problems. A field study integrating the disciplines of geology, geophysics, and petroleum engineering will be the mechanism for documenting the integrated approach. This is an area of keen interest to the oil and gas industry. The goal will be to provide tools and approaches that

can be used to detect reservoir compartments, reach a better reserve estimate, and improve profits early in the life of a field. Brief summaries are provided for the following six tasks: reservoir selection and data gathering; outcrop/core/log analysis/and correlations; internal architecture description; seismic analysis; detailed reservoir engineering evaluation; and permeability experimental work. Where appropriate reports by the research professors and the research assistants are included in the appendix.

14799 (DOE/BC/14894–6) **Application of artificial intelligence to reservoir characterization: An interdisciplinary approach. Quarterly report, October 1–December 31, 1994.** Tulsa Univ., OK (United States). [1995]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14894. Order Number DE95010480. Source: OSTI; NTIS; GPO Dep.

This basis of this research is to apply novel techniques from Artificial Intelligence and Expert Systems in capturing, integrating and articulating key knowledge from geology, geostatistics, and petroleum engineering to develop accurate descriptions of petroleum reservoirs. The main challenge of the proposed research is to automate the generation of detailed reservoir descriptions honoring all the available soft and hard data that ranges from qualitative and semi-quantitative geological interpretations to numeric data obtained from cores, well tests, well logs and production statistics. In this sense, the proposed research project is truly multidisciplinary. Additional challenges are the verification and validation of the expert system, since much of the interpretation of the experts is based on extended experience in reservoir characterization. The overall project plan to design the system to create integrated reservoir descriptions begins by initially developing an AI-based methodology for producing large-scale reservoir descriptions generated interactively from geology and well test data. Parallel to this task is a second task that develops an AI-based methodology that uses facies-biased information to generate small-scale descriptions of reservoir properties such as permeability and porosity. The third task involves consolidation and integration of the large-scale and small-scale methodologies to produce reservoir descriptions honoring all the available data. The final task will be technology transfer. With this plan, the authors have carefully allocated and sequenced the activities involved in each of the tasks to promote concurrent progress towards the research objectives. The results of the integration are not merely limited to obtaining better characterizations of individual reservoirs. They have the potential to significantly impact and advance the discipline of reservoir characterization itself.

14800 (DOE/BC/14970–2-Rev.) **Gypsy Field Project in reservoir characterization. Revision, Second quarterly report, [October 1, 1994–December 31, 1994].** Meara, D.J. Jr. Oklahoma Univ., Norman, OK (United States). Center for Reservoir Characterization. 22 Mar 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94BC14970. Order Number DE95010786. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to use the extensive Gypsy Field laboratory and data set as a focus for developing and testing reservoir characterization methods that are targeted at improved recovery of conventional oil. The Gypsy Field laboratory consists of coupled outcrop and subsurface sites which have been characterized to a degree of detail not possible in a production operation. Data from these sites entail geological descriptions. core measurements, well logs, vertical seismic surveys, a 3D seismic survey, crosswell seismic surveys, and pressure transient well tests. The overall project consists of four interdisciplinary sub-projects which are closely interlinked: (1) modeling depositional environments; (2) sweep efficiency; (3) tracer testing; and (4) integrated 3D seismic interpretation. The first of these aims at improving our ability to model complex depositional environments which trap movable oil. The second is a development geophysics project which proposes to improve the quality of reservoir geological models through better use of 3D seismic data. The third investigates the usefulness of a new numerical technique for identifying unswept oil through rapid calculation of sweep efficiency in large reservoir models. The fourth explores what can be learned from tracer tests in complex depositional environments, particularly those which are fluvial dominated. During this quarter, the main activities involved the Integrated 3-D Seismic Interpretation project, for which the progress is reported.

14801 (DOE/BC/14982–1) **An integrated study of the Grayburg/San Andres reservoir, Foster and South Cowden fields, Ector County, Texas. Quarterly technical progress report number 1, August 2–October 30, 1994.** Reeves, J.J.; Rowland, D.A.; Trentham, R.C. Laguna Petroleum Corp., Midland, TX (United States). [1994]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14982. Order Number DE95010482. Source: OSTI; NTIS; GPO Dep.

The objective of this study is to demonstrate a methodology for reservoir characterization of shallow shelf carbonate reservoirs which is feasible for the independent operator. Furthermore, it will provide one of the first public demonstrations of the enhancement of reservoir characterization using high resolution 3D seismic data. This particular project will evaluate the Grayburg and San Andres reservoirs in the Foster and South Cowden Fields of Ector County, Texas. The authors intend to showcase a multi-disciplinary approach to water flood design and implementation, along with the addition of reserves by selective infill drilling. They believe this approach in reservoir development will be applicable to a wide range of shallow shelf carbonate reservoirs throughout the US. During the month of August, 1994, the 3D seismic survey over the project area was shot by Dawson Geophysical. To date, the data is still being processed at Dawson Geophysical. Technology transfer will take place through all phases of the project.

14802 (DOE/ER/13412–T1) **A study of the source material, and mechanisms of generation, and migration of oils in the Anadarko Basin, Oklahoma. Progress report, September 1, 1986–August 31, 1987.** Philp, R.P. Oklahoma Univ., Norman, OK (United States). [1995]. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-85ER13412. Order Number DE95010168. Source: OSTI; NTIS; GPO Dep.

After the first year, when personnel and equipment were consolidated, the second year can be characterized by major advances in the various research areas falling within the project. In August and September of last year we moved into the newly completed Energy Center. This resulted in a dramatic increase in the laboratory space available to the group and allowed us to site our major research instruments in rooms conducive to good analytical practices. The two new mass spectrometer systems (isotope and triple stage quadrupole), alluded to in the previous report, arrived and were installed in December 1986 and January 1987, respectively. Since their installation they have both been working satisfactorily, with the minimum of downtime. The original description of this project was relatively broad, allowing more specialized areas to be investigated in detail, as they became evident. A number of areas of particular interest have now emerged. These include: (i) An oil-oil and oil-source rock correlation study of the Pauls Valley area, Garvin and Murray Counties, Oklahoma; (ii) A study of the effect of biodegradation on the bitumen of a tar sand, South Woodford area, Carter County, Oklahoma; and (iii) An organic geochemical survey of the Woodford Shale in the Anadarko Basin and surrounding areas. Whilst these specialized areas have consumed much of our effort, the broader scale study has also been advanced. Some of this work has been presented at national meetings. The remainder of this report details the samples available to us, at the present time, and discusses some of the major results of the various study areas mentioned above.

14803 (NEI-DK–1911) **Introduction to the project and a summary of the results.** Heilmann-Clausen, C.; Michelsen, O. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 42p. (In Danish). Contract ENS-1313/92-0003. Order Number DE95766537. Source: OSTI; NTIS.

EFP-92.

The report comprises an introduction to the project entitled 'Tertiaer bassinudvikling i Central Truget med saerlig vaegt paa mulige reservoirforekomster' (Basin development of the Tertiary of the Central Trough with emphasis on possible hydrocarbon reservoirs) and summarizes the results of the reports nos. 2-27 which have been produced in connection with the project. The overall aim of the project was, on the basis of a detailed sequence-stratigraphic

analysis, to identify periods dominated by sand-depositing within the palaeographic facies-distribution throughout that period. Another aim was to improve possibilities for localizing Tertiary bodies of sand which could be potential reservoirs of hydrocarbons and also to contribute to the possibilities for improving the modelling of basins with regard to hydrocarbon formation and accumulation. Regions dealt with are the North sea and coastal and land areas in Denmark. (AB)

14804 (NEI-DK–1918) **Seismic stratigraphy and foraminiferal biofacies in a profile into the Central Trough, North Sea.** Konradi, P.B.; Laursen, G.V.; Bidstrup, T. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 45p. Contract ENS-1313/92-0003. Order Number DE95766544. Source: OSTI; NTIS.

EFP-92.

Cutting samples from the exploration wells, Cleo-1, Mona-1 and Kim-1, in the Central Trough area in the northwestern part of the Danish North Sea, have been investigated for their foraminiferal content in the section above the prominent mid-Miocene marker. Benthonic foraminifers have been used to produce a stratigraphic subdivision by reference to the standard North Sea zonating of King. The North Sea Benthonic zones (NAB zones) 11 to 17 (Middle Miocene to Middle Pleistocene) have been identified above the event. The palaeoenvironmental indications of the zones are interpreted in each borehole. These results are compared to the seismostratigraphic framework of seismic profiles connecting the boreholes. Palaeoenvironmental reconstruction shows that generally sediments from the investigated interval from Cleo-1 were deposited in a shallower situation than equivalent deposits in Mona-1, and these again shallower than at Kim-1 and that the depocenter was changing through time as it prograded out into the basin. A conspicuous hiatus is identified in Cleo-1 and Mona-1 at the Pliocene-Pleistocene boundary. The seismic interpretation support the environmental interpretation of the bentihic fauna. (au) (20 refs.)

14805 (NEI-DK–1919) **Late Cenozoic sequences in the Southern North Sea Basin.** Soerensen, J.C.; Olaf Michelsen. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 44p. Contract ENS-1313/92-0003. Order Number DE95766545. Source: OSTI; NTIS.

EFP-92.

The late Cenozoic deposits, which cover the 'Mid-Miocene Unconformity' in the Danish, German and Dutch North Sea sectors, are subdivided into thirty-one sequences. An progradation from the east to the west is observed. Most of the sequences can be subdivided into systems tracts. Lowstand systems tracts often appear seismically as prograding wedges. In areas where high-angled progradation dominates the stratal pattern, the upper boundary of the lowstand systems tract is recognised as a prominent toplap surface. This unconformity is suggested as a bypass zone formed during lowstand progradation. The maximum flooding surface and the condensed section are identified as a maximum gamma ray peak, which separates an upward fining trend below the peak from an upward coarsening trend above. The two trends represent the transgressive and the highstand systems tracts, respectively. Sequence boundaries are often associated with widespread erosional troughs, extending in a direction perpendicular to the dominant direction of sediment transport. The erosion may have been caused by coastal parallel marine currents. The accumulation rates of the sediments seem to have culminated during periods with decreasing palaeo-temperatures. During a relatively stable and cold period, the sequences were deposited as prograding wedges with a limited lateral extension. Two periods of maximum palaeo-temperature are time equivalent with two distinct condensed intervals. The Ringkoebing-Fyn High seems to have influenced the regional distribution of the late Cenozoic sequences, and the sediment accumulation was mainly concentrated in the former Mesozoic basinal areas around the high. (au) (30 refs.)

14806 (NEI-DK–1922) **Palaeocene/Eocene diatomite in wells in the eastern North Sea.** Danielsen, M.; Thomsen, E. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 19p. Contract ENS-1313/92-0003. Order Number DE95766528. Source: OSTI; NTIS.

EFP-92.

Diatomite referred to the Palaeocene/Eocene boundary interval is described from wells in the eastern North Sea. The diatomite is rather similar to the diatomaceous Fur Formation in northwestern Jutland. Investigations of cuttings samples and log patterns in wells from the Norwegian sector indicate that the diatomite is stretching from the coast of Jutland towards the northwest along the southern coast of Norway, thus forming a natural continuation of the onshore deposit. (au) (16 refs.)

14807 (NEI-DK–1923) **A Mid-Miocene progradational, sandy barrier island and backbarrier section, central Jylland, Denmark.** Nielsen, S.A.V.; Nielsen, L.H. Aarhus Univ. (Denmark). Geologisk Inst.; Danmarks Geologiske Undersoegelske, Copenhagen (Denmark). 1995. 20p. Contract ENS-1313/92-0003. Order Number DE95766529. Source: OSTI; NTIS.

EFP-92.

This paper reports on a c. 15 m thick section of marine, coastal sand, that combine a hitherto less described facies succession transitional to the Miocene fluvio-deltaic and open marine deposits. The section is exposed in a pit located 10 km northeast of the sandy fluvio-deltaic brown coal bearing strata of the Soeby-Fasterholt area, known as the Odderup formation (Middle Miocene). The section comprises more than 6 m of trough cross-stratified, low-angle cross-stratified and parallel-laminated, sand and gravel, deposited on the foreshore and backshore of a barrier island. Locally these deposits are eroded by a steep-sided washover channel with a sandy fill. The overlying back-barrier deposits re up to 9 m thick, and are initiated by a thin bituminous mud bed with a mixture of terrigeneous and marine organic matter. Above, a series of 0.2-2 m thick beds of tangential to sigmoidal cross-stratified sand, often with well preserved topset, are deposited. These beds are interbedded with ripple-laminated and parallel-laminated sand. Burrows of Ophiomorpha, possibly Skolithos and Arenicolithes occur in the back-barrier deposits and in the top of the washover channel-fill. The succession of well-preserved coastal facies-belts indicates that the depositional area was characterized by a large sediment supply in combination with a rising sea-level. The section was probably formed fairly rapidly during a coastal progradation more or less contemporaneously with the general transgression that led to the deposition of the brackish-marine Hodde Formation and later the fully marine Gram Formation. (au) (14 refs.)

14808 (NEI-NO–507) **Exploration challenges: A global view.** Smith, H.A. Norsk Petroleumsforening, Oslo (Norway). 1994. 28p. (CONF-9408229–14: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766583. Source: OSTI; NTIS.

The conference paper gives a global view on offshore exploration challenges. Besides the many aspects discussed in this paper, the conclusion is to keep searching for new and better ways to rapidly adapt to the changing business environment, create the technology innovations to be searched for, and nurture the scientific creativity. According to the author, the alignment of technology with business needs, and capitalization on the strength of human resources are the keys to survival. Through this integration there is to be enhanced understanding of the petroleum system, shortening the exploration cycle time and cost reduction of finding. Technology and partnerships will improve the economics of the business, ultimately lead to new and varied opportunities. 15 figs.

14809 (NEI-NO–508) **Exploration challenges. A North Sea/Norwegian Sea perspective.** Nese, K. (Statoil (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 29p. (CONF-9408229–15: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766584. Source: OSTI; NTIS.

The conference paper deals with the Norwegian challenges offshore. In general, there is a move from large to small finds, from giant developments to development of marginal fields. The income from producing fields is declining rapidly in the years to come, and there is an increasing urge to realize early income from future prospects to maintain cash flow. Improved business opportunities within the oil and gas industry are to be realized requiring closer

collaboration between the actors in the industry and the authorities. These constructive processes are in progress in Norway. 21 figs.

14810 (NEI-NO–509) **Cost-effective technology levers to improve exploration and production efficiency.** Monti, R. Norsk Petroleumsforening, Oslo (Norway). 1994. 7p. (CONF-9408229–16: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766585. Source: OSTI; NTIS.

The conference paper deals with a vital goal for improving offshore exploration and production efficiency by cost-effective technology in slimhole drilling. The paper discusses the different instruments and tools designed for such applications. The most exciting developments are coiled-tubing drilling (CTD) combining the virtues of a small rig with some unique operational advantages. Experience has already shown that in the right circumstances drilling costs may be slashed using CTD. Drilling with coiled tubing is still developing, logging technology is being extended to deliver slimhole images equivalent to those from conventional wells, and smaller diameter testing is under trial and nearly ready for widespread use.

14811 (NEI-NO–510) **New seismic technology.** Ziolkowski, A. (Edinburgh Univ. (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 27p. (CONF-9408229–17: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766586. Source: OSTI; NTIS.

The conference paper aims to show that new seismic technology is becoming available to meet current challenges by using three-dimensional (3D) seismic data acquisition and processing. According to the author, it is often cost-effective to search for the structures using 3D methods from the start for three reasons: Firstly, because a more precise image is obtained at a much earlier stage in exploration; secondly, because 3D methods can sometimes reveal structures that are invisible to 2D methods; thirdly, the cost of acquisition, processing and interpretation of precise 3D data have been reduced considerably. Fast, accurate automatic imaging of structures by pre-stack depth migration is now realisable with new algorithms being developed, and the technology to acquire and process 3D data for rapid imaging of submarine geological structures is available. 7 figs.

14812 (NEI-NO–511) **What can a reservoir engineer expect from production geophysics. Now and in the future.** Beydoun, W. (Elf Geoscience Research Centre, London (United Kingdom)); Robein, E. Norsk Petroleumsforening, Oslo (Norway). 1994. 17p. (CONF-9408229–18: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766587. Source: OSTI; NTIS.

The conference paper deals with offshore seismic methods for analysing production geophysics. Firstly, the authors recall what information about the earth interior a seismic experiment can provide, and there are deduced what the reservoir model and the seismic data should ideally have in common and what is actually achieved in practice. Next the authors consider the actual usage of seismics in the building of a reservoir model, and what more advanced technique can offer at present and in future. The possibly and limits of reservoir monitoring by seismics are assessed. 38 refs., 2 figs.

14813 (NEI-NO–512) **Reservoir geophysics, today and tomorrow.** Walker, C. (PGS Exploration, Walton-on-Thames (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 19p. (CONF-9408229–19: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766588. Source: OSTI; NTIS.

The conference paper deals with geophysical techniques and methods for improving hydrocarbon recovery. The paper illustrates the collection of S-wave data. The complex relationship between porosity and permeability means that there is no unique link from seismic data to permeability, but 3D seismic data, well logs and core information can provide descriptions of the reservoir. By marrying the areal information derived from 3D seismic, VSP and cross well tomography with lithological and petrophysical data obtained from well logs and cores, the mapping capabilities can be extended to encompass reservoir rock propitious which are not directly discernible from the seismic data itself. By combining reservoir description data with fluid movement information derived from time lapse 3D integrated with reservoir engineering data, the reservoir can be monitored. 30 refs., 3 figs.

14814 (NEI-NO–518) **Azerbaijan: Cooperation and challenge.** Adams, T.D. (BP Exploration Co. (Azerbaijan)). Norsk Petroleumsforening, Oslo (Norway). 1994. 6p. (CONF-9408229–25: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766594. Source: OSTI; NTIS.

With the break up of the former Soviet Union, access to the oil rich basins of the Greater Caspian created unexpected options for new investments by the West. Baku, as a regional operating centre, has been producing oil since the 1870's, with an established infrastructure for both on and offshore oil development. Caspian offshore fields are restricted to relatively shallow waters, and much of the area remains unexplored or undeveloped. According to the author of this paper, there is a unique demand of regional cooperation. Unless a pipeline route to the west is successfully agreed in terms of route and finance, significant investments in Caspian will be delayed.

This report contains the results of efforts under the six tasks of the Eighth Amendment and Extension of Annex IV, Enhanced Oil Recovery Thermal Processes of the Venezuela/USA Agreement. The report is presented in sections and each section contains one or more reports prepared by various individuals or groups describing the results of efforts under each of the tasks. A statement of each task, taken from the agreement, is presented on the first page of each section.

14816 (DOE/BC–14661-10) **Oil recovery from naturally fractured reservoirs by steam injection methods. Final report.** Reis, J.C.; Miller, M.A. Texas Univ., Austin, TX (United States). Center for Petroleum and Geosystems Engineering. May 1995. 223p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90BC14661. Order Number DE95000140. Source: OSTI; NTIS; GPO Dep.

Oil recovery by steam injection is a proven, successful technology for nonfractured reservoirs, but has received only limited study for fractured reservoirs. Preliminary studies suggest recovery efficiencies in fractured reservoirs may be increased by as much as 50% with the application of steam relative to that of low temperature processes. The key mechanisms enhancing oil production at high temperature are the differential thermal expansion between oil and the pore volume, and the generation of gases within matrix blocks. Other mechanisms may also contribute to increased production. These mechanisms are relatively independent of oil gravity, making steam injection into naturally fractured reservoirs equally attractive to light and heavy oil deposits. The objectives of this research program are to quantify the amount of oil expelled by these recovery mechanisms and to develop a numerical model for predicting oil recovery in naturally fractured reservoirs during steam injection. The experimental study consists of constructing and operating several apparatuses to isolate each of these mechanisms. The first measures thermal expansion and capillary imbibition rates at relatively low temperature, but for various lithologies and matrix block shapes. The second apparatus measures the same parameters, but at high temperatures and for only one shape. A third experimental apparatus measures the maximum gas saturations that could build up within a matrix block. A fourth apparatus measures thermal conductivity and diffusivity of porous media. The numerical study consists of developing transfer functions for oil expulsion from matrix blocks to fractures at high temperatures and incorporating them, along with the energy equation, into a dual

porosity thermal reservoir simulator. This simulator can be utilized to make predictions for steam injection processes in naturally-fractured reservoirs. Analytical models for capillary imbibition have also been developed.

14817 (DOE/BC/14831–13) **Assist in the recovery of bypassed oil from reservoirs in the Gulf of Mexico. Quarterly status report (final), October 1–December 31, 1994.** Schenewerk, P.A. Louisiana State Univ., Baton Rouge, LA (United States). Dept. of Petroleum Engineering. [1995]. 95p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14831. Order Number DE95010481. Source: OSTI; NTIS; GPO Dep.

Much of the remaining oil offshore is trapped in formations that are extremely complex due to intrusion of salt domes. Conventional seismic processing techniques cannot clearly image either of these traps or the full extent of oil-bearing segments near the salt domes; therefore, substantial volumes of oil may have remained uncontacted by previous drilling. However, significant advances in seismic survey image processing have been made which when coupled with directional drilling technology, will allow better recovery prior to abandonment. Progress continues for reducing the data to fit a simplified model and redescribing the resource to accommodate known production behavior and certain geologic assumptions. Write-ups on the critical process parameter laboratory experiments in the form of a master's thesis have been completed. In addition, final reports are currently being prepared. The thrust of this progress report is the submittal of this master's thesis dealing with attic oil recovery by gas injection. This was a bench-scale experiment using a water and oilflooded sand pack to help develop a numerical simulation which would adequately predict optimal gas injection rates and expected recovery. The paper reviews the effect of soak time, slug size, dip angles, and injection schemes on the oil recovery.

14818 (DOE/BC/14831–14) **Assist in the recovery of bypassed oil from reservoirs in the Gulf of Mexico.** Schenewerk, P.A. Louisiana State Univ., Baton Rouge, LA (United States). Dept. of Petroleum Engineering. 17 Mar 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14831. Order Number DE95010778. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to assist in the recovery of non-contacted oil from known reservoirs on the Outer Continental Shelf in the Gulf of Mexico. Mature offshore reservoirs, declining oil reserves, declining production, and other natural forces currently are accelerating the abandonment of offshore oil resources and production platforms. Significant quantities of this oil could be recovered using advanced technologies now available if the resource can be identified. During the past year, a report on the simulation work performed on the U-8 reservoir was completed in the form of a master's thesis.

14819 (DOE/BC/14852–9) **Scale-up of miscible flood processes for heterogeneous reservoirs. Quarterly report, July 1, 1994–September 30, 1994.** Orr, F.M. Jr. Stanford Univ., CA (United States). Oct 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92BC14852. Order Number DE95010779. Source: OSTI; NTIS; GPO Dep.

The current project is a systematic research effort aimed at quantifying relationships between process mechanisms that can lead to improved recovery from gas injection processes performed in heterogeneous Class I and Class II reservoirs. It will provide a rational basis for the design of displacement processes that take advantage of crossflow due to capillary, gravity and viscous forces to offset partially the adverse effects of heterogeneity. In effect, the high permeability zones are used to deliver fluid by crossflow to zones that would otherwise be flooded only very slowly. Thus, the research effort is divided into five areas: development of miscibility in multicomponent systems; design estimates for nearly miscible displacements; design of miscible floods for fractured reservoirs; compositional flow visualization experiments; and simulation of near-miscible flow in heterogeneous systems. The status of the research effort in each area is reviewed briefly.

14820 (DOE/BC/14852–11) **Scale-up miscible flood processes for heterogeneous reservoirs. Quarterly report, 1 October–31 December 1994.** Orr, F.M. Jr. Stanford Univ., CA (United States). Dept. of Petroleum Engineering. Jan 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92BC14852. Order Number DE95010780. Source: OSTI; NTIS; GPO Dep.

The current project is a systematic research effort aimed at quantifying relationships between process mechanisms that can lead to improved recovery from gas injection processes performed in heterogeneous Class 1 and Class 2 reservoirs. It will provide a rational basis for the design of displacement processes that take advantage of cross flow due to capillary, gravity-and viscous forces to offset partially the adverse effects of heterogeneity. In effect, the high permeability zones are used to deliver fluid by crossflow to zones that would otherwise be flooded only very slowly. Thus, the research effort is divided into five areas: development of miscibility in multicomponent systems design estimates for nearly miscible displacements design of miscible floods for fractured reservoirs compositional flow visualization experiments; and simulation of near-miscible flow in heterogeneous systems. The status of the research effort in each area is reported briefly in the following section.

14821 (DOE/BC/14882–11) **Responsive copolymers for enhanced petroleum recovery. Quarterly technical progress report, September 11, 1994–December 22, 1994.** McCormick, C.; Hester, R. University of Southern Mississippi, Hattiesburg, MS (United States). Dept. of Polymer Science. [1994]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14882. Order Number DE95010475. Source: OSTI; NTIS; GPO Dep.

Advanced polymer systems that possess microstructural features that are responsive to temperature, electrolyte concentration, and shear conditions are being synthesized which will be superior to polymers presently used for mobility control in enhanced oil recovery. Improved polymer performance is accomplished by controlling hydrophobic or ampholytic interations between individual polymer chains in solution. The advanced polymers will circumbent major problems inherent in conventional EOR polymers in which molecular weight is usually compromised to allow sufficient solution viscosity and uniform reservoir permeation without plugging the porous media. Accomplishments are reported for the following tasks: quaternary ammonium cyclopolymer synthesis; characterization of molecular structure and solution behavior; ^{23}Na NMR studies of non-binding to anionic polyelectrolytes and solution rheology.

14822 (DOE/BC/14886–9) **Investigation of oil recovery improvement by coupling an interfacial tension agent and a mobility control agent in light oil reservoirs Second annual report, October 1993–September 1994.** Pitts, M.J. Surtek, Inc., Golden, CO (United States). Apr 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92BC14886. Order Number DE95000138. Source: OSTI; NTIS; GPO Dep.

"Investigation of Oil Recovery Improvement by Coupling an Interfacial Tension Agent and a Mobility Control Agent in Light Oil Reservoirs" is studying two major areas concerning co-injecting an interfacial tension reduction agent(s) and a mobility control agent. The first area defines the interactions of alkaline agents, surfactants, and polymers on a fluid-fluid and a fluid-rock basis. The second area concerns the economic improvement of the combined technology. This report continues the fluid-fluid interaction evaluations and begins the fluid-rock studies. Fluid-fluid interfacial tension work determined that replacing sodium ion with either potassium or ammonium ion in solutions with interfacial tension reduction up to 19,600 fold was detrimental and had little or no effect on alkali-surfactant solutions with interfacial tension reduction of 100 to 200 fold. Reservoir brine increases interfacial tension between crude oil and alkaline-surfactant solutions. Na_2CO_3-surfactant solutions maintained ultra low and low interfacial tension values better than NaOH-surfactant solutions. The initial phase of the fluid-rock investigations was adsorption studies. Surfactant adsorption is reduced when co-dissolved with alkali. Na_2CO_3 and Na_3PO_4 are more efficient at reducing surfactant adsorption than NaOH. When polymer is added to the surfactant solution, surfactant adsorption is reduced as well. When both polymer and alkali are added, polymer is the dominate component, reducing the Na_2CO_3 and NaOH effect on

adsorption. Substituting sodium ion with potassium or ammonium ion increased or decreased surfactant adsorption depending on surfactant structure with alkali having a less significant effect. No consistent change of surfactant adsorption with increasing salinity was observed in the presence or absence of alkali or polymer.

14823 (DOE/BC/14891–6) **Interdisciplinary study of reservoir compartments. Annual technical report.** Van Kirk, C.W. Colorado School of Mines, Golden, CO (United States). Dept. of Petroleum Engineering. 28 Oct 1994. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14891. Order Number DE95010485. Source: OSTI; NTIS; GPO Dep.

This DOE research project was established to document the integrated team approach for solving reservoir engineering problems. The goal will be to provide tools and approaches that can be used to detect reservoir compartments, reach a better reserve estimate, and improve profits early in the life of a field. Field selection consumed nearly the first four months of the project. The choice was the Hambert Field area which is the field area being studied. During the remainder of the year, a significant portion of the data was gathered and entered into a data base. Cores have been described, log analysis performed on over 100 wells, and regional mapping and correlation of sedimentary packages completed. Compressional (P) and shear (S) wave velocity data was measured on 8 core plugs at various conditions and lithologies. The analysis of the 3D seismic data has been started and supports the interpretation that the structural component will be a significant factor for reservoir compartmentalization in this reservoir. The experimental permeability work completed includes the pressure decay profile permeability measurements on the cores. Relationships of porosity and permeability with net confining stress were developed. Core relative permeability measurements were also completed during the year. Additional experimental measurements completed include Young's Modulus, Shear Modulus, Poisson's ratio, and the bulk compressibility as a function of the effective stress. Preliminary engineering analysis of the pressure build-up data from two wells supports the conclusion that sealing faults may act as barriers to flow.

14824 (DOE/BC/14892–4) **Visual display of reservoir parameters affecting enhanced oil recovery.** Wood, J.R. Michigan Technological Univ., Houghton, MI (United States). Jan 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-93BC14892. Order Number DE95010782. Source: OSTI; NTIS; GPO Dep.

This project deals with visual presentation of well logging data. The decision was made to use Microsoft Access as the project Database Manager. Data tables for geochemical, petrographic, and geophysical well logs, well header information, and well production data have been completed.

14825 (DOE/BC/14956–9) **Identification and evaluation of fluvial-dominated deltaic (Class 1 oil) reservoirs in Oklahoma. Yearly technical progress report, January 1–December 31, 1993.** Mankin, C.J. (Oklahoma Geological Survey, Norman, OK (United States)); Banken, M.K. Oklahoma Univ., Norman, OK (United States). 30 Mar 1994. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14956. Order Number DE95010483. Source: OSTI; NTIS; GPO Dep.

The Oklahoma Geological Survey (OGS), the Geological Information Systems department, and the School of Petroleum and Geological Engineering at the University of Oklahoma are engaged in a five-year program to identify and address Oklahoma's oil recovery opportunities in fluvial-dominated deltaic (FDD) reservoirs. This program includes the systematic and comprehensive collection, evaluation, and distribution of information on all of Oklahoma's FDD oil reservoirs and the recovery technologies that can be applied to those reservoirs with commercial success. Exhaustive literature searches are being conducted for these plays, both through published sources and through unpublished theses from regional universities. A bibliographic database has been developed to record these literature sources and their related plays. Trend maps are being developed to identify the FDD portions of the relevant reservoirs, through accessing current production databases and through compiling the literature results. A reservoir database system also has been developed, to record specific reservoir data elements that are identified through the literature, and through public and private data sources. Thus far, the initial demonstration for one has been completed, and second is nearly completed. All of the information gathered through these efforts will be transferred to the Oklahoma petroleum industry through a series of publications and workshops. Additionally, plans are being developed, and hardware and software resources are being acquired, in preparation for the opening of a publicly-accessible computer users laboratory, one component of the technology transfer program.

14826 (DOE/BC/14958–9) **Green River Formation Water Flood Demonstration Project, Uinta Basin, Utah. Quarterly technical progress report, October 1, 1994–December 31, 1994.** Lomax, J.D. (Lomax Exploration Co., Denver, CO (United States)); Nielson, D.L.; Deo, M.D. Lomax Exploration Co., Denver, CO (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14958. Order Number DE95010477. Source: OSTI; NTIS; GPO Dep.

The project is designed to increase recoverable petroleum reserves in the United States. In 1987, Lomax Exploration Company started a water flood in the Monument Butte unit, targeting the Green River Formation. This was a low-energy, geologically heterogeneous reservoir producing a waxy crude oil. Primary production yielded about 5% of the OOIP. The water flood was very successful, and it is estimated that the total production from the unit will exceed 20% of OOIP. The objective of this project was to evaluate the successful Monument Butte unit water flood and transfer the technology to other parts of the unit and to the Travis and Boundary units. Progress reports are presented for field drilling and production of the Monument Butte unit, Travis unit, and Boundary unit; and reservoir analysis near wellbore effects.

14827 (DOE/BC/14960–7) **Post waterflood CO_2 miscible flood in light oil, fluvial-dominated deltaic reservoir. FY 1993 annual report.** Davis, D.W. Texaco Exploration and Production, Inc., New Orleans, LA (United States). Mar 1995. 164p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14960. Order Number DE95000120. Source: OSTI; NTIS; GPO Dep.

The project is a Class 1 DOE-sponsored field demonstration project of a CO_2 miscible flood project at the Port Neches Field in Orange County, Texas. The project will determine the recovery efficiency of CO_2 flooding a waterflooded and a partial waterdrive sandstone reservoir at a depth of 5,800. The project will also evaluate the use of a horizontal CO_2 injection well placed at the original oil-water contact of the waterflooded reservoir. A PC-based reservoir screening model will be developed by Texaco's research lab in Houston and Louisiana State University will assist in the development of a database of fluvial-dominated deltaic reservoirs where CO_2 flooding may be applicable. This technology will be transferred throughout the oil industry through a series of technical papers and industry open forums.

14828 (DOE/BC/14961–6) **Dynamic enhanced recovery technologies. Quarterly technical report, October–December, 1994.** Anderson, R.N. Columbia Univ., Palisades, NY (United States). Lamont-Doherty Earth Observatory. 15 Jan 1995. 138p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-93BC14961. Order Number DE95010484. Source: OSTI; NTIS; GPO Dep.

This is a progress report on a US Department of Energy research project on oil and gas reservoirs located in and around Eugene Island area of offshore Louisiana. The project involves the collection of seismic data for reinterpretation and mapping reservoir characteristics using new techniques and visualization software. Based on this and other information test wells were drilled into growth fault zones of the reservoir to help determine information on fluid migration and trapping mechanisms. Other information being collected during this research is information on reservoir geochemistry, construction of pressure and temperature maps, and stratigraphy. Salt diapirs are also investigated as to age and chemical composition and structure.

14829 (DOE/BC/14970–2) **Gypsy field project in reservoir characterization. Quarterly report, October 1, 1994–December 31, 1994.** O'Meara, D.J. Jr. Oklahoma Univ., Norman, OK (United

States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94BC14970. Order Number DE95010377. Source: OSTI; NTIS; GPO Dep.

The overall objective of this project is to use the extensive Gypsy Field laboratory and data set as a focus for developing and testing reservoir characterization methods that are targeted at improved recovery of conventional oil. The Gypsy Field laboratory consists of coupled outcrop and subsurface sites which have been characterized to a degree of detail not possible in a production operation.

14830 (DOE/BC/14977–3) **Improved efficiency of miscible CO_2 floods and enhanced prospects for CO_2 flooding heterogeneous reservoirs. Quarterly technical progress report, October 1, 1994–December 31, 1994.** Grigg, R.B.; Heller, J.P.; Schechter, D.S. New Mexico Petroleum Recovery Research Center, Socorro, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94BC14977. (PRRC–95-9). Order Number DE95010383. Source: OSTI; NTIS; GPO Dep.

The objective of this research is to improve the effectiveness of carbon dioxide flooding in heterogeneous reservoirs. Activities are being conducted in three closely related areas: (1) further exploration of the applicability of selective mobility reduction in the use of foam flooding, (2) possible higher economic viability of floods at slightly reduced carbon dioxide injection pressures, and (3) taking advantage of gravitational forces during low IFT carbon dioxide flooding intight, vertically fractured reservoirs.

14831 (DOE/BC/14983–3) **Recovery of bypassed oil in the Dundee Formation using horizontal drains. Quarterly report, October 1994–December 1994. 1st Quarter, FY 1995.** Wood, J.R. Michigan Technological Univ., Houghton, MI (United States). Jan 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14983. Order Number DE95010382. Source: OSTI; NTIS; GPO Dep.

This focus of this project is to consider the enhanced recovery of petroleum from the Dundee deposit using horizontal wells. Evaluation wells are being drilled. This report contains summaries of administrative aspects of the project and a discussion of software developed for the project.

14832 (DOE/BC/14984–2) **Improved recovery demonstration for Williston Basin carbonates. Quarterly report, October 1, 1994–December 31, 1994.** Luff Exploration Co., Denver, CO (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14984. Order Number DE95010379. Source: OSTI; NTIS; GPO Dep.

The purpose of this project is to demonstrate targeted infill and extension drilling opportunities, better determinations of oil-in-place, methods for improved completion efficiency and the suitability of waterflooding in certain shallow-shelf carbonate reservoirs in the Williston Basin, Montana, North Dakota and South Dakota. Results of seismic surveys are presented.

14833 (DOE/BC/14990–2) **Application of reservoir characterization and advanced technology to improve recovery and economics in a lower quality shallow shelf carbonate reservoir. Fourth quarterly technical progress report, [October 1, 1994–December 31, 1994].** Taylor, A.M. Oxy USA, Inc., Welch, TX (United States). 30 Jan 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC22-94BC14990. Order Number DE95010471. Source: OSTI; NTIS; GPO Dep.

The focus of the project is to show that the use of advanced technology can improve the economics of CO_2 projects in low permeability reservoirs. The approach involves the use of tomography and pore throat measurements to enhance reservoir characterization. Cyclic CO_2 stimulations and frac treatments will be used to increase and facilitate oil recovery to improve project economics. Reservoir description and simulation will be used along with cyclic CO_2 stimulation and frac treatments to arrive at an optimum operating plan to be instituted during the second budget period. The official start up of the project was 8/3/94, so 12/31/94 represents the end of the second quarter. However, work in the area of cyclic CO_2 stimulation and reservoir characterization had taken place prior to the official start date under pre-award approval. Object to be accomplished during the second quarter included: detailed petrophysical description of cores from the observation wells; integrate the petrophysical data into a geologic model; acquire the tomography surveys; initiate processing of tomographic data; complete enhanced interpretation of 3-D seismic volume in the DOE demonstration area; develop relationship between seismic attributes and well log parameters; and complete cyclic CO_2 stimulation treatments. A majority of these objectives were accomplished during the fourth quarter of 1994. There are still six tomography surveys to be conducted during January. Processing of the tomographic data has gotten off to a slow start, but will accelerate with an upgrading computing power. The initial CO_2 injection into one of the cyclic wells has not been completed.

14834 (DOE/CE/15600–T5) **Method for cutting steam heat losses during cyclic steam injection of wells. Fifth quarterly report.** S-Cal Research Corp., San Rafael, CA (United States). Mar 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG49-93CE15600. Order Number DE95010371. Source: OSTI; NTIS; GPO Dep.

The estimated Heavy Oil reserves of the Cat Canyon field, in Southern California, are about 27 MMB, of which only a little more than 1 MMB have been produced, since its discovery in 1908.This very slow recovery rate is due to several causes: (1) The 8 - 10 API oil is very viscous; (2) The main reservoir sand (Sisquoc of Late Pliocene, early Miocene Age) at depths ranging from 2,200 ft to 3,000 ft requires high-temperature, high-pressure steam (up to 600 F at 1,550 psia), resulting in high tubing heat loss with conventional well configurations; (3) The friable sand is very fine-grained and easily entrained by the produced viscous crude. Although cyclic steam injection methods have been used successfully in this field, their cost is increased by the large tubing heat losses. This problem may be alleviated by using our sequential cyclic steam injection process, but the high pumping cost resulting from the presence of sand in the pumped crude stream may only be addressed by a special type of oil pump, which requires two parallel tubings. The addition of a third tubing in the basic 10.75 inches. Cased well configuration, developed for the Midway-Sunset field is feasible, but the downhole flow connection between the twin tubings of the pump must be included in our Lower Special Casing Joints. In view of the interest expressed by a Cat Canyon Operator to field-test our Downhole Hardware and technology, the present Report describes the design modifications which have been made to the Top Lower Special Joint (TLSJ), presented in Report No. 3 in order to include this feature, thus allowing the use of a sand-tolerant pumping system, when necessary. These low-cost modifications will extend the range of applicability of our technology and facilitate its market penetration.

14835 (DOE/MT/94003–2) **Assistance to the states with risk based data management. Quarterly technical progress report, October 1, 1994–December 31, 1994.** Paque, M.J. Underground Injection Practices Council Research Foundation, Oklahoma City, OK (United States). 30 Jan 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94MT94003. Order Number DE95010386. Source: OSTI; NTIS; GPO Dep.

The following is a quarterly Technical Progress Report of the Risk Based Data Management Systems (RBDMS) project. This project is administered by the Underground Injection Practices Research Foundation (UIPRF) which is the foundation of the Ground Water Protection Council (GWPC).

14836 (NEI-NO–537) **State-of-the-art fracturing in the North Sea.** Domelen, M.S. van (Halliburton Energy Services (Netherlands)); Jacquier, R.C.; Sanders, M.W. Norsk Petroleumsforening, Oslo (Norway). 1994. 22p. (CONF-9408229–44: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766613. Source: OSTI; NTIS.

The present paper focuses on recent advances in hydraulic fracturing technology with emphasis on North Sea applications. Improved pre-treatment diagnostic techniques and better understanding of the effects of completion design, have significantly increased the success rate of fracturing deviated and horizontal wells. Recent advances in diagnostic injection tests, real-time treatment analysis, and on-site redesign capabilities help ensure that hydraulic fracturing can be successfully applied in marginal fields.

Seawater fracturing fluid systems need refinement, and surface equipment pressure limitations need to be expanded. The North Sea is using high-permeability reservoirs to enhance the overall profitability of the project and as an alternative to traditional sand control applications in soft, weakly consolidated reservoirs. Advances in fluid design and post-treatment flowback procedures have minimized the effects of hydraulic fracturing, and service companies are applying environmental criteria early in the process of chemical development. 78 refs., 19 figs., 2 tabs.

14837 (NEI-NO–538) **Drilling fluid technology. Meeting the environmental challenges.** Young, S. (Anchor Drilling Fluids (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 6p. (CONF-9408229–45: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766614. Source: OSTI; NTIS.

The conference paper deals with advanced drilling fluid technology. Current and future developments in the North Sea area are likely to present ever increasing technical and environmental challenges. The economics of such developments will dictate maximum technical performance from the drilling fluid. The ongoing developments and success of water based drilling fluids have challenged oil based drilling fluid performance. The reduction of environmental impact and extension of the technical performance of these fluids in extended reach, slim hole and horizontal drilling, where formation damage, lubricity, and wellbore stability aspects of these fluids have been greatly improved, these new generation water based fluids are to be readily used in wells which were previously considered "oil base only". 1 tab.

14838 (NEI-NO–539) **Multilateral completion technology.** Hay, B. (Baker Oil Tools (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 11p. (CONF-9408229–46: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766615. Source: OSTI; NTIS.

The conference paper focuses on the recent advances and developments in completion systems to address multilateral completions with current capabilities and trends. The systems, with their advantages and disadvantages included, are as follow: Generic application variants; multi-branch system with isolation; dual lateral systems; combination system with full selective reentry; downhole splitter system. Because splitter wells share the same surface location and casing, the process takes less time and materials than drilling two conventional wells. An estimation of the drilling time saved for the splitter well is 8-10 days for each additional well drilled. 7 figs.

14839 (NEI-NO–540) **HT/HP operations. Challenges in planning, drilling and testing HPHT wells.** Aarrestad, T.V. (Statoil (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 13p. (CONF-9408229–47: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766616. Source: OSTI; NTIS.

High Pressure/High Temperature (HPHT) wells have been recognised to have a rather high cost for drilling and testing compared with both standard wells and other deep wells. STATOIL realised the need for a multi-company technology programme on planning, drilling and testing such wells. The paper discusses some of the items investigated in this programme with 12 major oil companies involved. Four projects were established: Prediction, Drilling, Testing and Post Analysis. Major challenges and problem areas have been investigated through specific activities. Pore pressure prediction has been studied both from geophysical and basin modelling concept. Items such as Rig Requirements, Casing Design, Down Hole Equipment and Cementing Techniques have been evaluated. Design verification and equipment testing are included to give increased understanding of problems both in drilling and testing HPHT wells. 2 refs., 6 figs., 1 tab.

14840 (NEI-NO–542) **Cementing/additives technology enhancement.** Bianchi, R. (Wheaterford (Italy)); Riccobon, L. Norsk Petroleumsforening, Oslo (Norway). 1994. 9p. (CONF-9408229–49: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766618. Source: OSTI; NTIS.

The conference paper deals with the exploration and development of ultra deep reservoirs located at 7.000 m. The combination of BHP pressure (1.000 bar) and high temperature (close to 200°C) together with long cementing intervals has driven the development of drilling and cementing innovative technology to positively face these critical HP/HT requirements. The best conditions for primary cementing should be established long before the actual cementing operation. According to the author, advanced cementing products and technology integrated by effective slurry additives are vital items but not unique. In HP/HT severe conditions, great attention must be paid for all the variable influencing factors connected with phase optimisation. The paper discusses the optimization of drilling, casing running, and cementing. 4 figs., 6 tabs.

14841 (NEI-NO–557) **The worldwide IOR challenge seen from an international oil company's viewpoint.** Guillon, O. (Elf Geoscience Research Centre (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 21p. (CONF-9408229–64: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766633. Source: OSTI; NTIS.

The conference paper deals with methods of improving oil recovery processes. According to the author, the maturity of the North Sea as an oil and gas province would provide an excellent opportunity to promote improved recovery applications while the infrastructure still exists. It would appear that the gas injection process is the best adapted recovery process, because of the low oil viscosity, the possibility of gravity stabilisation, and the high reservoir permeability that usually prevails. Studies show a large potential for additional oil recovery by gas injection. To be successful, it will undoubtedly be associated with technical innovation (horizontal wells, light platforms) and new combination of existing technologies. Innovations in the systems of taxation and regulation would be equally important, providing incentives for those operators willing to risk considerable investment now, which would be crucial to avoid wasting vast natural resources in the future. 8 refs., 21 figs., 1 tab.

14842 (NEI-NO–558) **IOR-options and challenges on the Norwegian Continental Shelf.** Nystad, A.N. (Oljedirektoratet (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 6p. (CONF-9408229–65: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766634. Source: OSTI; NTIS.

The average recovery for the about 30 oil fields in production and under development on the Norwegian Continental Shelf is 36%. The Norwegian Petroleum Directorate (NPD) has suggested a long term goal to increase the average recovery rate to 45%. Such a goal will add another 400-500 million tons of oil, or approximately 3.0-3.5 billion barrels, in relation to these oil fields. If the portfolio of other discoveries and the possibility of further technological advances are included, the total upside potential for improved oil recovery on the Norwegian shelf relative to todays assumptions might be as high as 800-900 million tons or approximately 6.0-6.5 billion barrels.

14843 (NEI-NO–559) **The IOR experience and strategies related to some UK fields.** Brealey, N.J. (British Petroleum Exploration (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 9p. (CONF-9408229–66: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766635. Source: OSTI; NTIS.

The conference paper discusses methods and experience by improved oil recovery on the UK continental shelf. Topics are: Cost target; a changing world - a changing industry; improved oil recovery (IOR) efforts; early enhanced oil recovery (EOR) efforts; Forties chemical EOR experience; other Forties EOR experience; Thistle experience; non BP EOR experience; other technology innovation; technology strategy for the future. 9 refs., 4 figs.

14844 (NEI-NO–560) **The IOR experience and strategies related to some Norwegian fields.** Utseth, R.H. (Statoil (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 31p. (CONF-9408229–67: ONS '94: 11. international Offshore Northern Seas

conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766636. Source: OSTI; NTIS.

The conference paper discusses the strategies of enhanced oil recovery on the Norwegian continental shelf together with the obtained experience so far. Topics cover: Technical achievements and pilot tests: lessons learned; going for capillary-trapped oil: surfactant pilot in Gullfaks; combined water/gas injection flood; non-swept oil: water shutoff with silica-gel; risk-reward analysis: comparison with prospect evaluation and risk-evaluation in the Statfjord field; the impact of reservoir description in IOR; management issues; the role of the governmental authorities. 17 figs.

14845 (DOE/MT/92020–9) **Improvement of hydrogen solubility and entrainment in hydrocracker feedstocks. Quarterly technical report, October 1, 1994–December 31, 1994.** Kabadi, V.N. North Carolina Agricultural and Technical State Univ., Greensboro, NC (United States). Dept. of Chemical Engineering. [1994]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92MT92020. Order Number DE95010788. Source: OSTI; NTIS; GPO Dep.

Hydrogen solubility in different crude oil fractions was predicted using modified UNIFAC. A new procedure for characterizing crude oil fractions has been established. Functional group concentrations were estimated by means of suggested group models with non-integer number n as a function of temperature. The validity of the model structure was tested by calculating the deviation between predicted and experimental molecular weights. The procedure has been found to work well for different petroleum fractions. The hydrogen solubility was calculated by modified UNIFAC model with the new interaction parameters as a function of temperature. The comparison between predicted and experimental solubilities confirms the suggested model structure for crude oil cuts validity. It was found that hydrogen solubilities could be reasonably predicted by using modified UNIFAC with 12% average error at atmospheric pressure.

14846 (NEI-NO–553) **The pursuit of health, safety and environment objectives.** Armstrong, K. (Chevron Overseas Petroleum, Inc. (United States)). Norsk Petroleumsforening, Oslo (Norway). 1994. 14p. (CONF-9408229–60: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766629. Source: OSTI; NTIS; INIS.

The conference paper examines certain issues facing E and P companies with respect to health, safety and environment (HSE) management and costs. It reviews some of the pressures forcing companies to increase their HSE cost reductions. It discusses the critical role that risk management plays in efforts to resolve these competing pressures so as to best protect shareholder value, and it identifies some areas for potential improvement. Finally, it examines the contribution industry partnerships with government can make in promoting cost-effective HSE risk management. 8 refs.

14847 (NEI-NO–554) **The role of trade unions in the pursuit of HSE-goals.** Fjelldal, T. (Norwegian Oil and Petrochemical Union, NOPEF (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 9p. (CONF-9408229–61: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766630. Source: OSTI; NTIS; INIS.

The conference paper discusses the role of trade unions in Norway in pursuing Health, Safety, Environment (HSE). In the Norwegian tradition social responsible unions, broad participation, continuous development of the company organization, are key factors to improve the working environment. In laws and agreements the unions have a well-defined role in pursuing HSE goals. Joint action programmes between the confederations NHO/LO (Norwegian Employers' Confederation/Norwegian Federation of Trade Unions) and other investments in HSE, pays off. The paper concentrates on the HSE-organization, factors which might improve the working environment, and the union role. 10 refs., 7 figs.

14848 (NEI-NO–555) **The role of statutory regulation in the pursuit of HSE-goals.** Ognedal, M. (Oljedirektoratet, Stavanger (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 6p. (CONF-9408229–62: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766631. Source: OSTI; NTIS.

The conference paper discusses the role of statutory regulation on efficient management of offshore safety, health and environment in Norway. Topics are as follow: The need for statutory regulation of petroleum industry; the regulators' role as a standard setter; trends in the development of the regulators' role as a standard-setter; trends in the development of the regulators' role as a supervisor.

14849 (NEI-NO–556) **Developments within safety, health and environment standards and regulator systems in North-Western Europe.** Hughes, H.W.D. (UK Offshore Operators Association (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 14p. (CONF-9408229–63: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766632. Source: OSTI; NTIS.

The scope of the present paper is to cover offshore environmental matters by addressing environmental standards and regulator systems in North-Western Europe. Aspects discussed here are as follow: Safety performance in the UK offshore industry; The UK offshore safety regime - status and issues; costs of offshore safety in the UK; some issues relating to European Union (EU) legislation; safety issues at European, North Sea, level; regulatory approaches to environmental issues. 6 figs.

0207 Economic, Industrial, and Business Aspects

14850 (DOE/EIA–0380(95/04)) **Petroleum Marketing Monthly, April 1995, with data for January 1995.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. Apr 1995. 196p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009667. Source: OSTI; NTIS; GPO Dep.

International crude oil prices rose moderately in January 1995, under the combined influences of lower production and higher demand. Crude oil output both from the Organization of Petroleum Exporting Countries (OPEC) and from non-OPEC nations declined from December levels due to a variety of causes, including severe weather in the North Sea and a platform explosion offshore Nigeria. At the same time, strong demand, especially from Asia, revised buying patterns and tightened markets worldwide. In the United States, reformulated gasoline (RFG) remained the dominant market influence, with the official start of the program at the retail level on January 1. Repercussions from the "opting out" of counties in Pennsylvania, New York, and Maine in December continued to disrupt supply patterns and confuse markets. Gasoline prices spiked at mid-month, but ended near where they began, while distillate prices declined due to warm weather and high inventories. A sharp seasonal decline in motor gasoline volumes led total refiner sales of the major petroleum products down 5.9 percent from December levels. January market and sales activity for crude oil and the principal petroleum products is summarized in the following sections.

14851 (IEE-SR–258) **Trends of oil producing countries in the world. Mostly on national oil companies.** Institute of Energy Economics, Tokyo (Japan). Aug 1994. 170p. (In Japanese). Order Number DE95769735. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

The paper describes the oil situation surrounding national oil companies in major oil producing countries in the world and future prospect, and analyzes resource open policies. If classifying the trends of the international oil market into a scenario of the open market and a scenario of the managing market, the market seems to be moving along the open market. OPEC has been increasing its market share in and after the middle of the 1980s, but hasn't regained the price-ruling power yet. Future problems for the scenario of the open market are the environment and restrictions on investment in increasing petroleum production capacity caused by shortage of funds. With regard to the environmental issue, a study is made on introduction of an 'oil well root tax' by oil producing countries against introduction of the carbon tax by developed countries. Of national oil companies in Europe, the U.S., and Central America, attention is paid to promotion of privatization and gradual reduction in number of shares held by government. This is because partially of privatization as part of relaxation of regulations arising from accepting IMF's financial assistance due to the state finance being aggravated. 98 figs., 42 tabs.

14852 (MMS–94-0060) **Federal Offshore Statistics, 1993. Leasing, exploration, production, and revenue as of December 31, 1993.** Francois, D.K. Minerals Management Service, Herndon, VA (United States). 1994. 171p. Sponsored by Department of the Interior, Washington, DC (United States). Source: OSTI; INIS; Minerals Management Service, Technical Communications Service, 381 Elden Street, MS 4530, Herndon, Virginia 22070-4817 (United States).

This document contains statistical data on the following: federal offshore lands; offshore leasing activity and status; offshore development activity; offshore production of crude oil and natural gas; federal offshore oil and natural gas sales volume and royalties; revenue from federal offshore leases; disbursement of federal offshore revenue; reserves and resource estimates of offshore oil and natural gas; oil pollution in US and international waters; and international activities and marine minerals. A glossary is included.

14853 (NEI-NO–499) **New frontiers for tomorrow's world.** Kassler, P. (Shell International Petroleum Co. Ltd., London (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 10p. (CONF-9408229–6: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766575. Source: OSTI; NTIS; INIS.

The conference paper deals with new frontiers and barricades in the global economic development and their influence on fuel consumption and energy source development. Topics discussed are incremental energy supply - new frontiers, world car population - new frontiers, OPEC crude production capacity vs call on OPEC, incremental world oil demand by region 1992-2000, oil resource cost curve, progress in seismic 1983-1991, Troll picture, cost reduction in renewables, sustained growth scenario, nuclear electricity capacity - France, OECD road transport fuels - barricades, and energy taxation. 18 figs.

14854 (NEI-NO–513) **The need for getting the balance right in matching economy, technology and people.** Norvik, H. (Statoil (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 14p. (CONF-9408229–20: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766589. Source: OSTI; NTIS; INIS.

The exploitation of the North Sea has reached a mature stage, and the dependency on new gigantic field discoveries to provide the returns needed in future are changing. According to the author of this paper, excellence in management of change will be as important as technical excellence in obtaining success and to get the right balance between technology, economy and employees to maintain competitiveness on the Norwegian Continental Shelf. The aim of Statoil is to improve the profitability in the range of 12%, and to reduce costs and time by 30-40%. A cost reduction of 25% within the drilling sector is obtained. Alliances are built to utilize synergies, reduce costs and develop new business opportunities. Trade union representatives have a lot to offer in the Board of the Company and in the internal work in the company as well. Safety aspects are added.

14855 (NEI-NO–514) **Technical developments in other industries and right-sizing of organizations. A retrospective view of corporate down sizing in the U.S.** Kragness, M.E. (ROI Consultants, Inc., Minneapolis, MN (United States)). Norsk Petroleumsforening, Oslo (Norway). 1994. 23p. (CONF-9408229–21: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766590. Source: OSTI; NTIS; INIS.

The conference paper deals with the Amoco sweeping plan to boost profits and expand operations in US. The company refocused its oil exploration strategy and sought a cultural transformation within the organization in addition to cutting payroll. The paper offers background to help understanding why corporate downsizing has become a popular and perhaps necessary management strategy using the collective experience of many U.S. companies to examine how downsizing has occurred and its human and financial consequences. The paper offers several approaches to workforce management, which address the need to increase employee productivity and corporate profits while minimizing the human and financial costs of layoffs. 40 refs.

14856 (NEI-NO–515) **Consequences for people from changed economic requirements and implementations of new technology.** Myhre, L.A. (Norwegian Oil and Petrochemical Union, NOPEF (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 6p. (CONF-9408229–22: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766591. Source: OSTI; NTIS; INIS.

The offshore oil and gas business has reached mature levels where improvements and efficiency, optimisation and down-sizing are necessary to achieve required economic performance. The paper discusses the oil worker in future with the focus on manning and safety as a consequence of new technologies and cost reduction. 1 fig.

14857 (NEI-NO–516) **The human element of right-sizing. BP experiences.** Hollis, J.W. (BP Norge (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 5p. (CONF-9408229–23: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766592. Source: OSTI; NTIS; INIS.

BP (British Petroleum) Exploration has been engaged in a worldwide repositioning exercise to improve its business performance. Despite a 40% fall in average oil price, the profitability and revenues have both grown, while the workforce has more than halved. BP is now able to test itself against price assumptions as low as $ 14 a barrel and make as good a return as it was near to $ 20. The paper discusses such a process of repositioning.

14858 (NEI-NO–517) **The experience of western oil companies in Russia.** Moerland, A. (Amoco Erusia Petroleum Co., Moscow (Russian Federation)). Norsk Petroleumsforening, Oslo (Norway). 1994. 8p. (CONF-9408229–24: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766593. Source: OSTI; NTIS; INIS.

The oil and gas industry is the most important industry to Russia providing 52% of all hard currency earnings for the country. The oil production is declining by more than 30% during recent years from 10.3 billion barrels per day in 1990 to 7.1 billion barrels today. The paper discusses the Amoco engagement in the Priobskoye Field in western Siberia containing up to 5 billion barrels of recoverable oil requiring capital investments of more than 25 billion dollars over the first 20 years. Over the last five years, foreign companies have worked with their Russian counterparts to complete numerous feasibility studies on many projects. In the next few months, important developments may take place such as the offshore Sakhalin in the East and the Timan Pechora region in the North. The experienced barriers connected to the activities, burden of taxes, policy issues etc., are dealt with.

14859 (NEI-NO–519) **Session cost efficient solutions for field development.** Taranger, K.P. (Saga Petroleum A/S (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 12p. (CONF-9408229–26: ONS '94: 11. international Offshore Northern

Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766595. Source: OSTI; NTIS; INIS.

Oil companies in Norway and the oil related industry are presently in the middle of a one year long, and quite substantial, efficiency-process named NORSOK. The NORSOK has the objective of finding more cost- and time-efficient ways of exploiting oil and gas from the Norwegian Continental Shelf. The paper discusses the industrial participation in the NORSOK working groups. It presents the changes to be foreseen as a result of experience gained, through previous projects as well as efficiency processes, and which will be applied to the planning and execution of two current field development projects, namely the Vigdis field in the North Sea and the Midgard field in the Haltenbanken area.

14860 (NEI-NO–522) **A new approach to cost effective projects: High performance project teams.** Chambers, N.C. (Brown and Root Energy Services (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 10p. (CONF-9408229–29: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766598. Source: OSTI; NTIS; INIS.

In low oil price environment in which environmental conditions are more challenging, reservoir characteristics less favourable and political risk increasing, successful projects are required in such cases. The present paper deals with the visionary process of establishing high performance project teams. According to the author, such project teams embody dynamic recognition of holism. Holism is achieved as an output from the process of establishing the drivers and enablers for success on a project. They are given birth during the unfolding of the operators development plans and contracting strategy. The paper discusses the main drivers of project teams comprising purpose and performance goals, selection, common approach, commitment and accountability, and financial alignment.

14861 (NEI-NO–523) **System supplier approach to projects and operations efficiency.** Moe, P.O. (Siemens Offshore A/S (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 11p. (CONF-9408229–30: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766599. Source: OSTI; NTIS; INIS.

The conference paper outlines the most important elements for a new approach to project realisation that enable a cost reduction of 30-50% compared to conventional methods. The achievements are based on studies and evaluations to the Norwegian Vigdis development project. The system elements covered are the electrical and automation systems including safety and process control and all traditional phases of a project from concept design to the operational phase. The concept involves new principles for project execution where traditional borderlines and interfaces between the various participants have been redefined. Management attention has been verified as an important prerequisite for a successful implementation of this strategy. 2 figs.

14862 (NEI-NO–531) **Advantages of the production contractor concept.** Gisvold, K.M. (Golar-Nor Offshore, Trondheim (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 13p. (CONF-9408229–38: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766607. Source: OSTI; NTIS; INIS.

This paper presents some thoughts on the Production Contractor concept. It starts with an attempt to define the prerequisites for such contractorship to exist and develop, going on to examine the considerations that the oil company and the contractor respectively have to go through, and finally trying to summarize what emerges as the advantages of production contracting. Examples are given to emphasize particular points.

14863 (NEI-NO–532) **The world market for subsea technology.** Kvinnsland, O.-J. (Norland Consultants A/S (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 18p. (CONF-9408229–39: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766608. Source: OSTI; NTIS; INIS.

The conference paper deals with the Petrobase 2000 system designed for forecasting and analysis of offshore activities covering files of exploration, field development and operations. The electronic tool system forecasts offshore activities in a total of 90 countries around the world. Exploration activities are analysed on the basis of prospectivity of basin geology, availability of exploration acreage, terms of conditions applying as well as availability exploration services, regionally or nationally. The field development file contains data on all known discoveries offshore and announced plans for development. For discoveries where no plans for development exist, the tool system allows for a probability analysis to identify the most likely scheme and scheduling. 10 figs.

14864 (NEI-NO–533) **Cost reduction through system integration.** Helsing, P. (Kvaerner Energy (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 10p. (CONF-9408229–40: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766609. Source: OSTI; NTIS; INIS.

In resent years cost reduction has been a key issue in the petroleum industry. Several findings are not economically attractive at the current cost level, and for this and other reasons some of the major oil companies require the suppliers to have implemented a cost reduction programme to prequalify for projects. The present paper addresses cost reduction through system design and integration in both product development and working methods. This is to be obtained by the combination of contracts by reducing unnecessary coordination and allow re-use of proven interface designs, improve subsystem integration by "top down" system design, and improve communication and exchange of experience. 3 figs.

0208 Waste Management

14865 (DOE/MT/92009–10) **Evaluation of the freeze-thaw/evaporation process for the treatment of produced waters. Quarterly technical progress report, October 1–December 31, 1994.** Boysen, J.; Morotti, J. Resource Technology Corp., Laramie, WY (United States). [1994]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92MT92009. Order Number DE95010790. Source: OSTI; NTIS; GPO Dep.

The objectives of this research are related to development of a commercially-economic natural freezethaw/evaporation (FTE) process for the treatment and purification of water produced in conjunction with oil and gas. During the reporting period of 10/l/94 to 12/31/94, project research concentrated on Subtasks 2.0 (Task 2 Project Reporting) and 2.1 (Laboratory scale FTE Simulations). The objectives of Task 2 are to conduct laboratory- and bench-scale simulations for optimizing the design of the FTE process. Task 2 requires completion of six subtasks: Subtask 2.0 – Task 2 Project Reporting (initiated 3/l/93), Subtask 2.1 – Laboratory-scale FTE Simulations, Subtask 2.2 Re-evaluation of Process Economics Based on Laboratory-scale Process Simulation Results, Subtask 2.3 – Bench-scale FTE Simulations, Subtask 2.4 – Economic Assessment of Bench-scale Simulations, and Subtask 2.5 – Technical Report of Task 2. The completion of Subtasks 2.1 and 2.2 were planned for this quarter.

14866 (DOE/MT/91004–1) **Analysis of environmental constraints on expanding reserves in current and future reservoirs in wetlands. Final report.** Harder, B.J. Louisiana State Univ., Baton Rouge, LA (United States). Center for Coastal, Energy, and Environmental Resources. Mar 1995. 202p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-91MT91004. Order Number DE95000136. Source: OSTI; NTIS; GPO Dep.

Louisiana wetlands require careful management to allow exploitation of non-renewable resources without destroying renewable resources. Current regulatory requirements have been moderately successful in meeting this goal by restricting development in wetland habitats. Continuing public emphasis on reducing environmental impacts of resource development is causing regulators to reassess their regulations and operators to rethink their compliance strategies. We examined the regulatory system and found that reducing the number of applications required by going to a single

application process and having a coherent map of the steps required for operations in wetland areas would reduce regulatory burdens. Incremental changes can be made to regulations to allow one agency to be the lead for wetland permitting at minimal cost to operators. Operators need cost effective means of access that will reduce environmental impacts, decrease permitting time, and limit future liability. Regulators and industry must partner to develop incentive based regulations that can provide significant environmental impact reduction for minimal economic cost. In addition regulators need forecasts of future E&P trends to estimate the impact of future regulations. To determine future activity we attempted to survey potential operators when this approach was unsuccessful we created two econometric models of north and south Louisiana relating drilling activity, success ratio, and price to predict future wetland activity. Results of the econometric models indicate that environmental regulations have a small but statistically significant effect on drilling operations in wetland areas of Louisiana. We examined current wetland practices and evaluated those practices comparing environmental versus economic costs and created a method for ranking the practices.

14867 (SNV–4282) **Chemical and biological characterization of residential oil burner emission. A literature survey.** Westerholm, R.; Peterson, A. Swedish Environmental Protection Agency, Solna (Sweden). Feb 1994. 54p. Order Number DE95766692. Source: OSTI; NTIS; INIS.

This literature study covers the time period 1980 to 1993 and is concerned with oil burners used for residential heating with a nominal heating power of less than 20 kW, which are normally used in one-family houses. Emission samples from domestic heaters using organic fuels consists of a very complex matrix of pollutants ranging from aggregate states solid to gaseous. Biological effects elicited by exhaust emissions have been detected and determined. It has been shown for diesel vehicles that selection of fuel properties has an impact on combustion reaction paths which results in different exhaust chemical compositions. It was also determined that diesel fuel properties have an impact on the biological activity of diesel exhaust emissions, which is to be expected from their chemical characterization. As a result of this, Sweden has an environmental classification of diesel fuels which has been in force since 1991. Analogously, the Swedish Environmental Protection Agency has asked whether detrimental environmental and health effects from residential heating can be reduced by selection of fuel properties, and if so by how much? In addition, which properties are most important to control in a future environmental classification of heating oils? As a first step in this process, a literature survey was performed. Major topics were: Sampling technology, chemical composition, biological activity, and risk assessment of emissions. 33 refs, 11 tabs

0210 Legislation and Regulations

Refer also to citation(s) 14848, 14849, 14866, 15707

14868 (DOE/MT/94006–2) **A guidance document for Kentucky's oil and gas operators. Technical progress report, November 11, 1994–February 1, 1995.** Kentucky State Government, Frankfort, KY (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94MT94006. Order Number DE95010385. Source: OSTI; NTIS; GPO Dep.

This technical report is a summary of the progress made on "A Guidance Document For Kentucky's Oil and Gas Operators." It includes a revised outline, an introduction and summary of the state's regulatory requirements, and the Division of Oil and Gas's procedures for permitting a well. In the past quarter, several meetings of the task force have taken place. The task force is made up of a group of representatives of the exploration and production regulatory agencies in Kentucky. The first draft outline for the guidance document was reviewed by the task force and suggestions for changes were made. The group asked that the wording of the outline be simplified in order to make it easier for the small operator to understand. The group also suggested that the outline follow a more chronological order from permitting to plugging a well rather than separating the chapters by regulatory divisions. These changes were made and a new draft outline is submitted in this report. In addition to the outline, work on the first chapter has begun with a brief history of the oil and gas industry in Kentucky and how the different regulatory agencies were created. The first chapter also contains a summary of the Division of Oil and Gas's regulatory responsibilities. Summaries of the other state agencies are being prepared by the respective members of the task force. These summaries will be included in future technical reports. This report also contains the procedures for obtaining a permit from the Division of Oil and Gas. It contains instructions on filling out the permit application, the types of bonds that can be posted, and the spacing requirements in the different regions of Kentucky. This section will be included in chapter 2 of the guidance document.

14869 (CONF-941022–Vol.1, pp. 5-19) **Commercial jet fuel quality control.** Strauss, K.H. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

The paper discusses the purpose of jet fuel quality control between the refinery and the aircraft. It describes fixed equipment, including various types of filters, and the usefulness and limitations of this equipment. Test equipment is reviewed as are various surveillance procedures. These include the Air Transport Association specification ATA 103, the FAA Advisory Circular 150/5230-4, the International Air Transport Association Guidance Material for Fuel Quality Control and Fuelling Service and the Guidelines for Quality Control at Jointly Operated Fuel Systems. Some past and current quality control problems are briefly mentioned.

14870 (CONF-941022–Vol.1, pp. 29-42) **Analytic tests and their relation to jet fuel thermal stability.** Heneghan, S.P. (Univ. of Dayton Research Institute, OH (United States)); Kauffman, R.E. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. Contract F33615-92-C-2207. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

The evaluation of jet fuel thermal stability (TS) by simple analytic procedures has long been a goal of fuels chemists. The reason is obvious: if the analytic chemist can determine which types of material cause his test to respond, the refiners will know which materials to remove to improve stability. Complicating this quest is the lack of an acceptable quantitative TS test with which to compare any analytic procedures. To circumvent this problem, we recently compiled the results of TS tests for 12 fuels using six separate test procedures. The results covering a range of flow and temperature conditions show that TS is not as dependent on test conditions as previously thought. Also, comparing the results from these tests with several analytic procedures shows that either a measure of the number of phenols or the total sulfur present in jet fuels is strongly indicative of the TS. The phenols have been measured using a cyclic voltammetry technique and the polar material by gas chromatography (atomic emission detection) following a solid phase extraction on silica gel. The polar material has been identified as mainly phenols (by mass spectrometry identification). Measures of the total acid number or peroxide concentration have little correlation with TS.

14871 (CONF-941022–Vol.1, pp. 195-209) **The effect of copper, MDA, and accelerated aging on jet fuel thermal stability as measured by the gravimetric JFTOT.** Pande, S.G. (GeoCenters, Inc., Ft. Washington, MD (United States)); Hardy, D.R. USDOE Assistant Secretary for Fossil Energy, Washington, DC

(United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Thermally unstable jet fuels pose operational problems. In order to adequately identify such fuels, factors that realistically impact on thermal stability were examined. Evaluation was based on a quantitative method of measuring thermal stability, viz., NRL's recently developed gravimetric JFTOT. This method gives a quantitative measurement of both the strip deposit and filterables formed. The pertinent factors examined, included the individual and interactive effects of: soluble copper, MDA (metal deactivator), and aging. The latter was accelerated to simulate field conditions of approximately six months aging at ambient temperature and pressure. The results indicate that the individual and interactive effects of copper, MDA, and accelerated aging appear to be fuel dependent. Based on the results, the three test fuels examined (one JP-8 and two JP-5s) were categorized as exhibiting very good, typical, and poor thermal stabilities, respectively. For both the very good and poor thermal stability fuels, the effect of copper in conjunction with accelerated aging did not significantly increase the total thermal deposits of the neat fuels. In contrast, for the typical thermal stability fuel, the combined effects of copper and accelerated aging, did. Furthermore, the addition of MDA prior to aging of the copper-doped, typical stability fuel significantly counteracted the adverse effect of copper and aging. A similar beneficial effect of MDA was not observed for the poor stability fuel. These results focus on the compositional differences among fuels and the need to elucidate these differences (physical and chemical) for a better understanding and prediction of their performance.

14872 (CONF-941022–Vol.1, pp. 303-312) **Long term storage of finished gasolines in large salt caverns.** Koenig, J.W.J. (German Strategic Petroleum Reserve, Hamburg (Germany)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Strategic oil stocking requires large low cost storage facilities. Crude oil has been held in very large salt mines and/or artificially made salt caverns for many years, notably in Europe and the USA. Following crude oil, gasoils and refinery light feed stocks have been tried also. Military organisations tried jet fuel and early cases of underground aviation gasoline storage in steel tanks have been reported.

14873 (CONF-941022–Vol.1, pp. 313-325) **A strategic storage programme for developing countries - to be or not to be?.** Morse, B.W. (Petroleum Management Consultant, Moss (Norway)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

In the industrialised world agreements between countries or legislation will dictate that there shall be strategic fuel storage of "X" amount of days. What about the developing countries, the third world? For the most part they have no storage regulations. Should they consider a strategic fuel storage programme? If so, how can they go about it? What are the obstacles? Many have neither the technical expertise nor the monies. This paper will explore how developing countries can have a strategic oil storage programme - How they can plan, justify, finance, execute and operate such a storage without having a major impact on their countries.

14874 (CONF-941022–Vol.1, pp. 327-335) **Use of ASTM D5304 in assessing unstable diesel fuel.** Turner, L.M. (Defense Fuel Supply Center, Alexandria, VA (United States)); Martin, C.J.; Beal, E.J.; Hardy, D.R. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

The storage stability, or the length of time a fuel can be stored, is of great concern to diesel fuel users. This paper reports on the use of the new ASTM accelerated test for storage stability by oxygen overpressure (D5304) to predict future storage life span of 63,000,000 gallons of a diesel fuel for US Naval vessel use. This paper demonstrates the use of ASTM D5304 at storage times of 16, 40 and 96 hours to accurately determine the length of time that this large quantity of diesel fuel could be stored at ambient temperatures before the maximum allowable amount of particulate contamination was reached.

14875 (CONF-941022–Vol.1, pp. 337-347) **Metal-deactivating additives for liquid fuels.** Boneva, M.I. (Institute of Organic Chemistry, Sofia (Bulgaria)); Ivanov, S.K.; Kalitchin, Z.D.; Tanielyan, S.K.; Terebenina, A.; Todorova, O.I. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

The metal-deactivating and the antioxidant properties of 1-phenyl-3-methylpyrazolone-5 derivatives have been investigated both in the model reaction of low temperature oxidation of ethylbenzene and in gasoline oxidation. The study of the ability of these derivatives to reduce the catalytic effect of copper naphthenate demonstrates that they are promising as metal deactivating additives for light fuels. Some of the pyrazolone compounds appear to be of special interest for the long-term storage of liquid fuels due to their action as multifunctional inhibitors.

14876 (CONF-941022–Vol.2) **Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 2.** Giles, H.N. (ed.). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. Apr 1995. 514p. Sponsored by USDOE, Washington, DC (United States). From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. Order Number DE95009411. Source: OSTI; NTIS; GPO Dep.

Volume 2 of these proceedings contains 34 papers divided into the following sessions: Deposit and insolubles measurement (5 papers); Gasolines (4 papers); Heavy oils and refinery processing (3 papers); Middle distillate fuels (7 papers); New fuels and environmental mandates (5 papers); and a Poster session (10 papers). Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

14877 (NEI-NO–552) **Multiphase transport, experiences and challenges.** Lingelem, M.N. (Norsk Hydro A/S, Oslo (Norway)); Haaheim, S.; Aarvik, A. Norsk Petroleumsforening, Oslo (Norway). 1994. 7p. (CONF-9408229–59: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766628. Source: OSTI; NTIS.

Transport of unprocessed and partly processed well fluids is and has been an important part of the oil and gas industry. Although the technology has been widely used there is still a need for better knowledge and understanding of multiphase flow phenomena and problems associated with multiphase transport in order to achieve a continued reduction in cost for future field developments. Multiphase transport has a number of intrinsic problems. The main problems cover liquid accumulation and flow transients, corrosion and erosion, hydrate formation, and solid precipitation (e.g. wax, asphaltenes). The present paper discusses the problems in terms of experience and further development. 5 figs.

14878 (SAND–94-1026) **Structural stability of the Weeks Island oil repository.** Preece, D.S.; Ehgartner, B.L. Sandia National Labs., Albuquerque, NM (United States). Jun 1994. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract

AC04-94AL85000. Order Number DE95008798. Source: OSTI; NTIS; GPO Dep.

A 3-D finite element analysis was performed to evaluate the stability of the SPR upper and lower oil storage levels at Weeks Island. The mechanical analysis predicted stresses and strains from which pillar stability was inferred using a fracture criterion developed from previous testing of Weeks Island salt. This analysis simulated the sequential mining of the two levels and subsequent oil fill of the mine. The predicted subsidence rates compare well to those measured over the past few years. Predicted failure mechanisms agree with observations made at the time the mine was being modified for oil storage. The modeling technique employed here treats an infinite array of pillars and is a reasonable representation of the behavior at the center of the mine. This analysis predicts that the lower level pillars, at the center of the mine, have fractured and their stability at this time is questionable. Localized pillar fracturing is predicted and implies that the mine is entering a phase of continual time dependent deterioration. Continued and expanded monitoring of the facility and development of methods to assess and predict its behavior are more important now than ever.

14879 (CONF-941022–Vol.1, pp. 21-28) **The transition of new technology to solve today's problems.** Kamin, R.A. (Naval Air Warfare Center, Trenton, NJ (United States)); Martin, C.J.; Turner, L.M. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Extensive research has been conducted in the development of methods to predict the degradation of F-44 in storage. The Low Pressure Reactor (LPR) has greatly enhanced the stability prediction capabilities necessary to make informed decisions concerning aviation fuel in storage. This technique has in the past been primarily used for research purposes. The Naval Air Warfare Center, Aircraft Division, Trenton, NJ, has used this technique successfully to assist the Defense Fuel Supply Center, Cameron Station, Alexandria, VA, in stability assessments of F-44. The High Performance Liquid Chromatography/Electrochemical Detector (HPLC/EC) antioxidant determination technique has also aided in making stability predictions by establishing the amount of inhibitor currently in the product. This paper will address two case studies in which the above new technology was used to insure the rapid detection and diagnosis of today's field and logistic problems.

14880 (CONF-941022–Vol.1, pp. 43-57) **Behaviour of conductivity improvers in jet fuel.** Dacre, B. (Cranfield Univ., Wiltshire (United Kingdom)); Hetherington, J.I. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. Contract FS 1a/375,1993. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Dangerous accumulation of electrostatic charge can occur due to high speed pumping and microfiltration of fuel. This can be avoided by increasing the electrical conductivity of the fuel using conductivity improver additives. However, marked variations occur in the conductivity response of different fuels when doped to the same level with conductivity improver. This has been attributed to interactions of the conductivity improver with other fuel additives or fuel contaminants. The present work concentrates on the effects of fuel contaminants, in particular polar compounds, on the performance of the conductivity improver. Conductivity is the fuel property of prime interest. The conductivity response of model systems of the conductivity improver STADIS 450 in dodecane has been measured and the effect on this conductivity of additions of model polar contaminants sodium naphthenate, sodium dodecyl benzene sulphonate, and sodium phenate have been measured. The sodium salts have been found to have a complex effect on the performance of STADIS 450, reducing the conductivity at low concentrations to a minimum value and then increasing the conductivity at high concentrations of sodium salts. This work has focused on characterising this minimum in the conductivity values and on understanding the reason for its occurrence. The effects on the minimum conductivity value of the following parameters are investigated: (a) time, (b) STADIS 450 concentration, (c) sodium salt concentration, (d) mixed sodium salts, (e) experimental method, (f) a phenol, (g) individual components of STADIS 450. The complex conductivity response of the STADIS 450 to sodium salt impurities is discussed in terms of possible inter-molecular interactions.

14881 (CONF-941022–Vol.1, pp. 59-73) **Stadis® 450 in Merox-sweetened jet fuels.** Henry, C.P. (DuPont, Deepwater, NJ (United States)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Stadis® 450 has been used in aviation fuels since 1983, and in many cases is the additive of choice due to conductivity retention of treated fuels during distribution, and other characteristics. In the past several years, manufacture of Shell ASA-3 (the other aviation-approved static dissipator additive) has been discontinued; current stores are being drawn down and for some refiners conversion from ASA-3 to Stadis® 450 is underway. In fuels sweetened by hydrogen-treating, Stadis® 450 performs very well and there are few reported difficulties. Chemically sweetened fuels sometimes contain trace materials not removed by the sweetening process. When treated with Stadis® 450 some of these fuels have exhibited two behaviors which are being addressed: in one case, the formation of a precipitate which disarmed coalescers; in several other cases, reduced conductivity response and loss of conductivity during storage coupled with unusually large effects on the microseparatometer water separation properties. In late 1992, a Coordinating Research Council (CRC) Panel on Coalescer Deactivation was formed to address these problems. The results of DuPont and CRC efforts are discussed, along with actions taken and underway to eliminate these problems.

14882 (CONF-941022–Vol.1, pp. 75-89) **Factors affecting the silver corrosion performance of jet fuel from the Merox process.** Viljoen, C.L. (Sasol Oil R&D (South Africa)); Hietkamp, S.; Marais, B.; Venter, J.J. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

The Natref refinery at Sasolburg, South Africa, which is 63,6% owned by Sasol and 36,5% by Total, is producing Jet A-1 fuel at a rate of 80 m^3/h by means of a UOP Merox process. A substantial part of the crude oil slate is made up from crudes which have been stored for considerable times in underground mines. Since the 1970's, Natref has experienced sporadic non-conformance of its treated jet fuel to the silver corrosion (IP 227) test. Various causes and explanations for the sporadic silver corrosion occurrence have been put forward but a direct causal link has remained obscure. The paper addresses these possible causes for silver corrosion and some of the process changes which have been made to alleviate the problem. Emphasis is placed on the most recent approaches which were taken to identify the origin of the sporadic silver corrosion. An inventory of all the potential causes was made, such a bacterial action, elemental sulphur formation in storage, etc. and experiments designed to test the validity of these causes, are discussed. A statistical evaluation which was done of the historical process data over a 2 year period, failed to link the use of mine crudes directly to Ag-corrosion occurrence. However, a correlation between elemental sulphur and H_2S levels in the feed to the Merox reactor and Ag-corrosion was observed. Finally, the outcome of the

experiments are discussed, as well as the conclusions which were reached from the observed results.

14883 (CONF-941022–Vol.1, pp. 91-102) **Autoxidation of jet fuels: Implications for modeling and thermal stability.** Heneghan, S.P. (Univ. of Dayton Research Institute, OH (United States)); Chin, L.P. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. Contract F33615-92-C-2207; Contract F33615-90-C-2033. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

The study and modeling of jet fuel thermal deposition is dependent on an understanding of and ability to model the oxidation chemistry. Global modeling of jet fuel oxidation is complicated by several facts. First, liquid jet fuels are hard to heat rapidly and fuels may begin to oxidize during the heat-up phase. Non-isothermal conditions can be accounted for but the evaluation of temperature versus time is difficult. Second, the jet fuels are a mixture of many compounds that may oxidize at different rates. Third, jet fuel oxidation may be autoaccelerating through the decomposition of the oxidation products. Attempts to model the deposition of jet fuels in two different flowing systems showed the inadequacy of a simple two-parameter global Arrhenius oxidation rate constant. Discarding previous assumptions about the form of the global rate constants results in a four parameter model (which accounts for autoacceleration). This paper discusses the source of the rate constant form and the meaning of each parameter. One of these parameters is associated with the pre-exponential of the autoxidation chain length. This value is expected to vary inversely to thermal stability. We calculate the parameters for two different fuels and discuss the implication to thermal and oxidative stability of the fuels. Finally, we discuss the effect of non-Arrhenius behavior on current modeling of deposition efforts.

14884 (CONF-941022–Vol.1, pp. 103-112) **Safe, acceptable anti-microbial strategies for distillate fuels.** Hill, E.C. (ECHA Microbiology Ltd., Cardiff (United Kingdom)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Microbiological fouling, spoilage and corrosion have for years been considered as end-user problems but they have now become endemic up-stream affecting cargoes, tank farms and terminals. Trading agreements to share storage and distribution facilities impose the need to mutually agree antimicrobial strategies which satisfy all health, safety and environmental regulations wherever that fuel is distributed and used. Also agreed must be the infection levels at which antimicrobial action is initiated. Physical decontamination methods are described and the use of biocides discussed in relation to increasing regulatory restrictions.

14885 (CONF-941022–Vol.1, pp. 113-128) **Case study: Use of isothiazolinone and nitro-morpholine biocides to control microbial contamination in diesel and gasoline storage and distribution systems.** Chesneau, H.L.; Passman, F.J.; Daniels, D. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Responding to feed-back from its retail outlet network, a major, vertically integrated petroleum company undertook to diagnose and remediate diesel and gasoline performance problems. Analysis of samples from tanks at refinery, distribution terminal and retail outlet sites established that uncontrolled microbial contamination was rampant throughout the distribution system. The company then developed and instituted a two-phase action plan. During Phase I, all tanks received corrective (shock) biocide treatment preceding mechanical tank cleaning and fuel polishing. An ongoing Phase II program currently includes routine sampling and analysis combined with periodic preventive biocide treatment. This paper describes the initial problem diagnosis, corrective action plan and preventive program; recommending the Phase II program as a model for all companies involved with refining, distribution or retailing gasoline.

14886 (CONF-941022–Vol.1, pp. 129-150) **Harmonisation of microbial sampling and testing methods for distillate fuels.** Hill, G.C. (ECHA Microbiology Ltd., Cardiff (United Kingdom)); Hill, E.C. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Increased incidence of microbial infection in distillate fuels has led to a demand for organisations such as the Institute of Petroleum to propose standards for microbiological quality, based on numbers of viable microbial colony forming units. Variations in quality requirements, and in the spoilage significance of contaminating microbes plus a tendency for temporal and spatial changes in the distribution of microbes, makes such standards difficult to implement. The problem is compounded by a diversity in the procedures employed for sampling and testing for microbial contamination and in the interpretation of the data obtained. The following paper reviews these problems and describes the efforts of The Institute of Petroleum Microbiology Fuels Group to address these issues and in particular to bring about harmonisation of sampling and testing methods. The benefits and drawbacks of available test methods, both laboratory based and on-site, are discussed.

14887 (CONF-941022–Vol.1, pp. 151-171) **Catalase measurement: A new field procedure for rapidly estimating microbial loads in fuels and water-bottoms.** Passman, F.J. (Biodeterioration Control Associates, Inc., Chicago, IL (United States)); Daniels, D.A.; Chesneau, H.F. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Low-grade microbial infections of fuel and fuel systems generally go undetected until they cause major operational problems. Three interdependent factors contribute to this: mis-diagnosis, incorrect or inadequate sampling procedures and perceived complexity of microbiological testing procedures. After discussing the first two issues, this paper describes a rapid field test for estimating microbial loads in fuels and associated water. The test, adapted from a procedure initially developed to measure microbial loads in metal-working fluids, takes advantage of the nearly universal presence of the enzyme catalase in the microbes that contaminated fuel systems. Samples are reacted with a peroxide-based reagent; liberating oxygen gas. The gas generates a pressure-head in a reaction tube. At fifteen minutes, a patented, electronic pressure-sensing device is used to measure that head-space pressure. The authors present both laboratory and field data from fuels and water-bottoms, demonstrating the excellent correlation between traditional viable test data (acquired after 48-72 hours incubation) and catalase test data (acquired after 15 min.-4 hours). We conclude by recommending procedures for developing a failure analysis data-base to enhance our industry's understanding of the relationship between uncontrolled microbial contamination and fuel performance problems.

14888 (CONF-941022–Vol.1, pp. 173-181) **Bacterial contamination of motor gasoline.** Hill, E.C. (ECHA Microbiology Ltd., Cardiff (United Kingdom)); Koenig, J.W.J. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on*

stability and handling of liquid fuels. Volume 1. 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Microbiological growth is found frequently in the bottom of jet fuel, distillate, heavy gasoil and crude oil tanks. Experience shows that traces of water - though theoretically enough for an outbreak of growth - rarely cause problems, because the tank is most probably drained frequently. However when a water table builds up and remains untouched for some time, the likelihood for growth, leading to later operational problems, rapidly increases. Normal paraffin hydrocarbons with c_8-c_{16} chain length appear to be especially vulnerable; in other words the kerosene/jet fuel boiling range is mainly at risk. Heavier hydrocarbon products (diesel, light heating oils and gasoils) however have increasingly seen problems over the last 15-20 years. Lighter products - mainly the gasoline boiling range appear to have been protected from microbial problems over many years. In a laboratory it was of course possible to degrade certain kinds of naphthas and finished gasolines, but those results did not mirror the findings in the field.

14889 (CONF-941022–Vol.1, pp. 183-194) **Biocidal treatment and preservation of liquid fuels.** Siegert, W. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Strict microbiological limit values are the result of damage caused by microorganisms in fuels. With MAR 71, a biocide based on methylenebisoxazolidine, a product is available which has been tested and approved by leading car manufacturers, the mineral oil industry, and NATO. Depending on the degree of microbiological contamination, different decontamination concepts are presented, and recommendations for the treatment of fuels which are contaminated when purchased are given. In order to avoid recontamination, planning principles or the new design of tanks are necessary. The possibility of convenient, economical and regular drainage is a key factor.

14890 (CONF-941022–Vol.1, pp. 211-226) **Mechanism of deposit formation on fuel-wetted metal surfaces.** Stavinoha, L.L. (Southwest Research Institute, San Antonio, TX (United States)); Westbrook, S.R.; McInnis, L.A. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. Contract DAAK70-87-C-0043; Contract DAAK70-92-C-0059. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Experiments were performed in a Single-Tube Heat Exchanger (STHE) apparatus and a Hot Liquid Process Simulator (HLPS) configured and operated to meet Jet Fuel Thermal Oxidation Tester (JFTOT) ASTM D 3241 requirements. The HLPS-JFTOT heater tubes used were 1018 mild steel, 316 stainless steel (SS), 304 stainless steel (SS), and 304 SS tubes coated with aluminum, magnesium, gold, and copper. A low-sulfur Jet A fuel with a breakpoint temperature of 254°C was used to create deposits on the heater tubes at temperatures of 300°C, 340°C, and 380°C. Deposit thickness was measured by dielectric breakdown voltage and Auger ion milling. Pronounced differences between the deposit thickness measuring techniques suggested that both the Auger milling rate and the dielectric strength of the deposit may be affected by deposit morphology/composition (such as metal ions that may have become included in the bulk of the deposit). Carbon burnoff data were obtained as a means of judging the validity of DMD-derived deposit evaluations. ESCA data suggest that the thinnest deposit was on the magnesium-coated test tube. The Scanning Electron Microscope (SEM) photographs showed marked variations in the deposit morphology and the results suggested that surface composition has a significant effect on the mechanism of deposition. The most dramatic effect observed was that the bulk of deposits moved to tube locations of lower temperature as the maximum temperature of the tube was increased from 300° to 380°C, also verified in a single-tube heat exchanger. The results indicate that the deposition rate and quantity at elevated temperatures is not completely temperature dependent, but is limited by the concentration of dissolved oxygen and/or reactive components in the fuel over a temperature range.

14891 (CONF-941022–Vol.1, pp. 227-240) **Effect of high surface area activated carbon on thermal degradation of jet fuel.** Gergova, K. (Pennsylvania State Univ., University Park, PA (United States)); Eser, S.; Arumugam, R.; Schobert, H.H. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. DOE Contract FG22-92PC92104. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Different solid carbons added to jet fuel during thermal stressing cause substantial changes in pyrolytic degradation reactions. Activated carbons, especially high surface area activated carbons were found to be very effective in suppressing solid deposition on metal reactor walls during stressing at high temperatures (425 and 450°C). The high surface area activated carbon PX-21 prevented solid deposition on reactor walls even after 5h at 450°C. The differences seen in the liquid product composition when activated carbon is added indicated that the carbon surfaces affect the degradation reactions. Thermal stressing experiments were carried out on commercial petroleum-derived JPTS jet fuel. We also used n-octane and n-dodecane as model compounds in order to simplify the study of the chemical changes which take place upon activated carbon addition. In separate experiments, the presence of a hydrogen donor, decalin, together with PX-21 was also studied.

14892 (CONF-941022–Vol.1, pp. 241-254) **Development of oxygen scavenger additives for jet fuels.** Beaver, B.D. (Duquesne Univ., Pittsburgh, PA (United States)); Demunshi, R.; Sharief, V.; Tian, D.; Teng, Y. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Our current research program is in response to the US Air Force's FY93 New Initiative entitled "Advanced Fuel Composition and Use." The critical goal of this initiative is to develop aircraft fuels which can operate at supercritical conditions. This is a vital objective since future aircraft designs will transfer much higher heat loads into the fuel as compared with current heat loads. In this paper it is argued that the thermal stability of most jet fuels would be dramatically improved by the efficient in flight-removal of a fuel's dissolved oxygen. It is proposed herein to stabilize the bulk fuel by the addition of an additive which will be judiciously designed and programmed to react with oxygen and produce an innocuous product. It is envisioned that a thermally activated reaction will occur, between the oxygen scavenging additive and dissolved oxygen, in a controlled and directed manner. Consequently formation of insoluble thermal degradation products will be limited. It is believed that successful completion of this project will result in the development of a new type of jet fuel additive which will enable current conventional jet fuels to obtain sufficient thermal stability to function in significantly higher temperature regimes. In addition, it is postulated that the successful development of thermally activated oxygen scavengers will also provide the sub-critical thermal stability necessary for future development of endothermic fuels.

14893 (CONF-941022–Vol.1, pp. 255-273) **Development of thermal stability additive packages for JP-8.** Anderson, S.D. (USAF Wright Lab., Wright-Paterson AFB, OH (United States)); Harrison, W.E. III; Edwards, T.; Morris, R.W.; Shouse, D.T. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Advanced military aircraft use fuel as the primary heat sink to cool engine and airframe components. As the fuel is thermally stressed, thermal oxidative reactions take place that result in the formation of deposits. These deposits degrade aircraft performance and ultimately lead to premature servicing of the affected components. The frequency of these incidents, coupled with the projected cooling requirements for future systems, demonstrates that current thermal stability limits are inadequate. In response to this situation, the United States Air Force (USAF) has embarked on a program to improve thermal stability using specially formulated additive packages. Results indicate that additives offer significant thermal stability improvement. This paper describes the USAF program to develop and deploy an improved JP-8 for fleet-wide use by 1998.

14894 (CONF-941022–Vol.1, pp. 275-289) **Studies of jet fuel additives using the quartz crystal microbalance and pressure monitoring at 140 C.** Zabarnick, S. (Univ. of Dayton Research Institute, OH (United States)); Grinstead, R.R. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. Contract F33615-92-C-2207. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

The quartz crystal microbalance (QCM) and pressure monitoring are used for the evaluation of jet fuel additives for the improvement of jet fuel thermal stability. The mechanisms of additive behavior are determined by measuring the time dependent deposition with the QCM and oxidation by pressure measurements. Studies at various additive concentrations permits the determination of optimum additive concentrations. Additive packages made of mixtures of antioxidants, detergent/dispersants, and metal deactivators are shown to yield good improvements in thermal stability over a wide range of jet fuel types.

14895 (CONF-941022–Vol.1, pp. 291-301) **Effect of additives on the formation of insolubles in a jet fuel.** Anderson, S.D. (Wright Lab., Wright-Patterson AFB, OH (United States)); Jones, E.G.; Goss, L.P.; Balster, W.J. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. Contract F33615-90-C-2033. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Dynamic near-isothermal techniques have proven to be valuable in assessing the tendency of aviation fuels to form surface and bulk insolubles under thermal stress. These methods are applied in this study to the investigation of the neat Jet-A fuel POSF-2827 and changes introduced by a series of four candidate additives. In each case fuel is stressed while flowing through a heat exchanger under near-isothermal conditions at 185°C. The average surface deposition rate as a function of stress duration and the quantity of both surface and bulk insolubles have been determined after complete consumption of the dissolved oxygen. The additives, introduced individually, include a common antioxidant, a metal deactivator, a dispersant, and a combination detergent/dispersant. Of the four additives, only the dispersant-types are found to improve fuel thermal stability.

14896 (CONF-941022–Vol.1, pp. 349-361) **The EBV Quality Prediction System (EQPS).** Koenig, J.W.J. (German Strategic Petroleum Reserve, Hamburg (Germany)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

An oil product is said to be ageing, if over time it changes appearance, performance characteristics or environmental properties. Ageing - and so is quality - is a summary term - embracing many influencing factors and observed behaviours. Ageing quality is a function of inherent or added immunity, environmental factors or exposure and of course age. Inherent factors are themselves a function of raw materials from which the product was made and the manufacturing processes used in the refinery.

14897 (CONF-941022–Vol.1, pp. 363-376) **The mathematical approach to EQPS - an expert system for oil quality prediction.** Hartman, J. (Israel Institute for Biological Research, Ness Ziona (Israel)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

EQPS is an expert system for prediction of ageing processes in long term storage of oil products. EQPS contains a data base with detailed information on the user's stored stocks, and a diagnostic Expert System which is used for analysis, evaluation and quality prediction of a given storage site. An extensive body of knowledge and information concerning oil products is included in the program. Petrochemical and petrobiological laboratory test results, source and product processing data, storage conditions, environmental and climatic factors, are all considered in the evaluation.

14898 (CONF-941022–Vol.1, pp. 377-389) **A rapid colorimetric method for predicting the storage stability of middle distillate fuels.** Marshman, S.J. (Defense Research Agency, Surrey (United Kingdom)). USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Present methods used to predict the storage stability of distillate fuels such as ASTM D2274, ASTM D4625, DEF STAN 05-50 Method 40 and in-house methods are very time consuming, taking a minimum of 16 hours. In addition, some of these methods under- or over-predict the storage stability of the test fuel. A rapid colorimetric test for identifying cracked, straight run or hydrofined fuels was reported at the previous Conference. Further work has shown that while a visual appraisal is acceptable for refinery-fresh fuels, colour development may be masked by other coloured compounds in older fuels. Use of a spectrometric finish to the method has extended the scope of the method to include older fuels. The test can be correlated with total sediment from ASTM D4625 (13 weeks at 43°C) over a sediment range of 0-60mg/L. A correlation of 0.94 was obtained for 40 fuels.

14899 (CONF-941022–Vol.1, pp. 391-405) **Thermal stability and filterability of jet fuels containing PDR additives in small-scale tests and realistic rig simulations.** Bauldreay, J.M. (Shell Research, Ltd., Chester (United Kingdom)); Clark, R.H.; Heins, R.J. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

Specification, small-scale and realistic fuel simulation tests have addressed concerns about the impact of pipeline drag reducer (PDR) flow modifying additives on jet fuel handling and performance. A typical PDR additive tended to block filters which were similar to those used in the specification Jet Fuel Thermal Oxidation Tester (JFTOT) and other thermal stability test apparatus. Blockages reduced flow rates and PDR concentrations downstream of the filters. Consequently two PDR additives (A&B) were tested in JFTOT apparatus without the usual in-line pre-filters as part of a Ministry of Defense (MoD) co-ordinated Round Robin exercise. Some fuel/PDR additive combinations caused decreases in JFTOT breakpoints. Effects were additive- (type, concentration and degree of shear) and fuel-dependent; most failures were caused by filter blockages and not by a failing lacquer rating. In further work at Thornton, the thermal stability characteristics of similar fuel/additive combinations have been examined in non-specification tests. In

Flask Oxidation Tests, PDR additives caused no significant increase in the liquid phase oxidation rates of the fuels. Additives were tested in the Single Tube Heat Transfer Rig (STHTR) which duplicates many of the conditions of a heat exchanger element in an engine's fuel supply system. B produced an average two-fold decrease in thermal stability in a Merox fuel; A had no significant effect. In hydrotreated fuel, B reduced the thermal stability up to five-fold. A had little effect below 205°C, while at higher temperatures there may have been a marginal improvement in thermal stability. Again, certain jet fuel/PDR combinations were seen to reduce thermal stability.

14900 (CONF-941022–Vol.1, pp. 407-421) **System evaluation of improved thermal stability jet fuels.** Binns, K.E. (Univ. of Dayton Research Institute, OH (United States)); Dieterle, G.L.; Williams, T. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. Contract F33615-92-C-2207. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

A single-pass, single-tube heat exchanger device called the Phoenix rig and a single-pass, dual-heat exchanger system called the Extended Duration Thermal Stability Test system are specific devices/systems developed for evaluating jet fuel thermal stability. They have been used extensively in the evaluation of various jet fuels and thermal stability additives. The test results have indicated that additives can substantially improve the thermal stability of conventional jet fuels. Relationships of oxygen consumption, residence time, bulk, and wetted wall temperatures on coking deposits that form in the heated tubes have also been investigated.

14901 (CONF-941022–Vol.1, pp. 423-431) **Improvement of test methodology for evaluating diesel fuel stability.** Gutman, M. (Internal Combustion Engines Lab., Haifa (Israel)); Tartakovsky, L.; Kirzhner, Y.; Zvirin, Y.; Luria, D.; Weiss, A.; Shuftan, M. USDOE Assistant Secretary for Fossil Energy, Washington, DC (United States). Office of Technical Management. 1995. From 5. international conference on stability and handling of liquid fuels; Rotterdam (Netherlands); 3-7 Oct 1994. In *Proceedings of the 5th international conference on stability and handling of liquid fuels. Volume 1.* 431p. Order Number DE95008873. Source: OSTI; NTIS; GPO Dep.

The storage stability of diesel fuel has been extensively investigated for many years under laboratory conditions. Although continuous efforts have been made to improve testing techniques, there does not yet exist a generally accepted correlation between laboratory methods (such as chemical analysis of the fuel) and actual diesel engine tests. A testing method was developed by the Technion Internal Combustion Engines Laboratory (TICEL), in order to address this problem. The test procedure was designed to simulate diesel engine operation under field conditions. It is based on running a laboratory-modified single cylinder diesel engine for 50 h under cycling operating conditions. The overall rating of each test is based on individual evaluation of the deposits and residue formation in the fuel filter, nozzle body and needle, piston head, piston rings, exhaust valve, and combustion chamber (six parameters). Two methods for analyzing the test results were used: objective, based on measured data, and subjective, based on visual evaluation results of these deposits by a group of experts. Only the residual level in the fuel filter was evaluated quantitatively by measured results. In order to achieve higher accuracy of the method, the test procedure was improved by introducing the measured results of nozzle fouling as an additional objective evaluating (seventh) parameter. This factor is evaluated on the basis of the change in the air flow rate through the nozzle before and after the complete engine test. Other improvements in the method include the use of the nozzle assembly photograph in the test evaluation, and representation of all seven parameters on a continuous scale instead of the discrete scale used anteriorly, in order to achieve higher accuracy. This paper also contains the results obtained by application of this improved fuel stability test for a diesel fuel stored for a five-year period.

14902 (Y/DK–1043) **Determination of halogens in a petroleum product by ion chromatography.** Tucker, H.L. Oak Ridge Y-12 Plant, TN (United States). 15 Jul 1994. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (CONF-950737–1: 36. Rocky Mountain conference on analytical chemistry, Denver, CO (United States), 31 Jul - 5 aug 1995). Order Number DE95002056. Source: OSTI; NTIS; GPO Dep.

A rapid, high-performance ion chromatography (HPIC) method with isocratic separation and the anion self-regenerating suppressor (in the chemical suppression mode, specifically for the determination of fluoride, chloride, bromide, and iodide in a petroleum product) is discussed. This is a proposed new method for a production laboratory within the Analytical Services Organization at the Oak Ridge Y-12 Plant.

14903 (INIS-mf–14488) **Chiren Underground Gas Storage - current state and possibilities for extension.** Ivanov, R.; Dimitrov, L. Nauchno-Tekhnicheski Syyuz na Energetitsite, Sofia (Bulgaria). 1994. 7p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627076. Source: OSTI; NTIS (US Sales Only); INIS.

The Chiren underground gas storage is created in a depleted gas bed and is put into operation in 1974. The period 1974-1977 was a stage of experimental compression/production of comparatively small gas quantities. After that trial period the cyclic exploitation of the storage started. The authors describe in detail the current status of the storage and analyse its design and operational data. The annual volumes (in nm^3) of compressed, produced and stored gas for the period 1974-1994 are tabulated. An analysis is also made of the technical state of the drilling rig, the changes in bed pressure and gas volume. The necessity for upgrading and extension of the storage is substantiated and a forecast for changes in gas pressure and volume is given. 4 tabs., 1 fig. (orig.).

14904 (INIS-mf–14500) **Condensing gas boilers for energy efficiency and reduction of CO_2 and NO_x.** Stewardson, E. (Beeston Heating Group Ltd. (United Kingdom)). No corporate text available. 1994. 11p. (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627077. Source: OSTI; NTIS (US Sales Only); INIS.

The objectives of the study are: (1) to demonstrate the effectiveness of condensing gas boiler hot water system in reducing energy costs and pollution; (2) to illustrate the importance of marketing this technology to uninformed end users. The development of condensing boilers in the European Community, the materials used, product designs, key performance measures, and the types of applications suited to these products are outlined. Using calculations from a body of work produced by the Chartered Institute of Building Service Engineers in Britain, it is demonstrated how seasonal

efficiency differs from combustion efficiency, and how the added capital cost for these boilers may be recovered within an acceptable commercial pay back period from fuel cost savings. Applying current NO_x and CO_2 information from a body of the CE Technical Committees, the author show how these products can reduce pollution levels both from CO_2 and NO_x. An example of marketing these products to a largely uninformed end user customer market is cited. 2 refs., 3 tabs., 12 figs. (orig.).

14905 (NEI-NO–504) **What is the cost of supply.** Commichau, A. (Mobil Erdgas-Erdoel GmbH, Hamburg (Germany)). Norsk Petroleumsforening, Oslo (Norway). 1994. 6p. (CONF-9408229–11: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766580. Source: OSTI; NTIS; INIS.

The conference paper discusses the cost of natural gas supply in Europe. The gas consumption has tripled over the last 20 years, and another 50-80% growth is expected for the following two decades despite a more or less stagnant total energy consumption and the introduction of a CO_2 tax to curb the greenhouse effect. Topics are as follow: European natural gas supply; European supply regions; cost of new pipeline gas to Europe; cost of new LNG to Europe; European gas imports - cost of incremental supplies.

14906 (NEI-DK–1947) **Natural gas distribution. Master plan for Kaunas City, Lithuania.** Carl Bro Energy A/S, Glostrup (Denmark); Hovedstadsregionens Naturgas I/S, Soeborg (Denmark); Carl Bro Gruppen, Glostrup (Denmark). Mar 1995. 311p. Contract IMOe-906. Order Number DE95772354. Source: OSTI; NTIS.

This master plan from a Danish firm for the distribution of natural gas in the city of Kaunas, Lithuania is presented in the form of a short summary followed by a collection of detailed technical notes and data. It is noted that the pipes comprising the distribution network are in a state of advanced corrosion which promotes a degree of uncertainty with regard to planning. Economical calculations indicated a clear benefit from renovation of the cathodic protection system. There is a plan for the extension of gas sales in Kaunas. Training courses for Lithuanian technicians have been carried out in Copenhagen (Denmark). Institutional, market, technical and financial aspects of the project are dealt with in the series of technical notes. General conclusions and recommendations are given on the subject of the possible renovation of the natural gas distribution system in Lithuania. (AB) (2 maps.)

14907 (SVF–533) **Polyethylene pipes for propane distribution.** Viebke, J. (Studsvik Material AB, Nykoeping (Sweden)). Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Feb 1995. 70p. (In Swedish). Project Vaermeforsk-G1-109. (STUDSVIK-M–94-141). Order Number DE95766641. Source: OSTI; NTIS.

The work was initiated in order to define the critical factors for distribution of propane in polyethylene pipes. The project has included pressure testing of MDPE-pipes with gaseous propane as internal medium at 60, 80, 95 and 105 degrees C, pressure testing with liquefied propane as internal medium at 20 and 40 degrees C, and pressure testing with oil residue as internal medium at 20 and 40 degrees C. A pressure testing equipment for pressure testing with gaseous propane at elevated temperatures has been constructed. Hydrostatic pressure testing, i.e. pressure testing with water as the internal medium, has been performed at 20, 40, 60, 80, 95 and 105 degrees C. OIT (oxidation induction time), crystallinity and TG (thermal gravimetry)-analyses have been performed and oil residue from a propane distribution system in service has been obtained and analysed. Scanning electron microscopy and X-ray microanalysis have been performed. The results from the pressure testing at 60, 80, 95 and 105 degrees C show that the durability of the MDPE-pipes toward gaseous propane is good. The results from the pressure testing with liquefied propane at 20 and 40 degrees C show that the Stage I-level of the MDPE-pipes is lowered with approximately 30%. In practice, this entails that condensation of propane in MDPE pipeline systems should be avoided, since this yields a vast decrease in the strength of the pipes. 10 refs, 23 figs, 26 tabs

Source: OSTI; NTIS; GPO Dep.

Argonne National Laboratory is examining alternatives to straight natural gas firing. Research has shown that the addition of certain catalytic agents, such as in hydrogen co-firing, shows promise. When hydrogen co-firing is used in tandem with steam injection, a decrease in both CO and NO_x emissions has been observed. In-process hydrogen production and premixing with the natural gas fuel are also being explored.

14909 (NEI-DK–1875) **Natural gas fired small size heating stations.** Dansk Gasteknisk Center A/S, Hoersholm (Denmark). 1994. 43p. Contract IMOe-639. Order Number DE95766434. Source: OSTI; NTIS.

A training 2-day course in natural gas fueled small heating plants was held by the Danish Gas Technology Centre. Operation, control, safety regulations, flue gas cleaning and pollution abatement as well as the economic factors of natural gas use were discussed. (au)

14912 (ORNL/TM–12867) **Network user's guide.** McGrady, P.W. Oak Ridge National Lab., TN (United States). Dec 1994. 135p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009185. Source: OSTI; NTIS; INIS; GPO Dep.

NETWORK is a FORTRAN code used to model process flow systems in the gaseous diffusion plants at Portsmouth, Ohio and Paducah, Kentucky, operated by the United States Enrichment Corporation. It can handle a wide range of components and several different types of controllers. NETWORK can be run in either a steady-state mode or a transient mode. In the transient mode many different types of perturbations may be modeled. It is currently being used to model taking a cell off-stream in a gaseous diffusion plant. A brief description of the code is given, and process equipment models and input data are discussed.

14913 (HW–77018) **[Travel to England for Sixth US-UK Information Exchange on Feed Materials.] Foreign trip report, November 23–December 9, 1962.** Minor, J.E. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 2 Jan 1963. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010022. Source: OSTI; NTIS; GPO Dep.

This report describes foreign travel by J.E. Minor, Manager-Metal Fabrication Development Operation, Hanford Laboratories, General Electric Company, Richland Washington. This travel occurred during the period November 23–December 9, 1962, the primary purpose being participation in the Sixth US-UK Information Exchange on Feed Materials. The information exchange was the sixth of its kind, and the first to include US Reactor Site personnel in discussions in England. The meeting was held to review fuel fabrication processes and development work.

This report investigates the feasibility and benefits of two new approaches to the analysis of safeguards data from reprocessing plants. Both approaches involve some level of plant modeling. All models involve some form of mass balance, either applied in the usual way that leads to material balances for individual process vessels at discrete times or applied by accounting for pipe flow rates that leads to material balances for individual process vessels at continuous times. In the first case, material balances are computed after each tank-to-tank transfer. In the second case, material balances can be computed at any desired time. The two approaches can be described as follows. The first approach considers the application of a new multivariate sequential test. The test statistic is a scalar, but the monitored residual is a vector. The second approach considers the application of recent nonlinear time series methods for the purpose of empirically building a model for the expected magnitude of a material balance or other scalar variable. Although the report restricts attention to monitoring scalar time series, the methodology can be extended to vector time series.

14915 (WSRC-MS–94-0605) **Wall thinning acceptance criteria for degraded carbon steel piping systems using FAD methodology.** Lam, P.S.; Gupta, N.K. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950740–4: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95005887. Source: OSTI; NTIS; GPO Dep.

As part of the structural integrity assessment for Savannah River Site (SRS) piping systems, an acceptance criteria methodology for minimum pipe wall thickness has been developed for carbon steel piping. If a measured pipe thickness during inspection cannot meet the 87.5% of the nominal wall thickness specified in the ASME Code Case N-480, the acceptance criteria must be invoked. For a particular pipe, the larger of the two minimum thickness values obtained from the code stress check and the CEGB-R6 Failure Assessment Diagram (FAD) methodology is the minimum wall thickness for the acceptance criteria. The code stress check is based on the ASME/ANSI B31.1 Code, ASME Code Case N-480, and the SRS reactor restart criteria. The pipe wall thickness is calculated from the code equations and the applied loads. In fracture analysis, three types of axial and circumferential flaws are assumed to exist in the pipes based on the weld defects found in service history. For each flaw configuration, the stress intensity factors and the limit load solutions are calculated. These quantities are input to FAD to solve for the corresponding wall thickness required for the pipe to sustain the postulated flaws and to meet ASME safety margins under the applied loads.

14916 (ANL/FO/CP–84381) **Simplified risk assessment for transporting ATR spent fuel within the INEL.** Franklin, E.M. (Argonne National Lab., Idaho Falls, ID (United States)); Courtney, J.C.; Roesener, R.A. Argonne National Lab., Idaho Falls, ID (United States). [1994]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941207–36: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95009900. Source: OSTI; NTIS; INIS; GPO Dep.

Interest in characterizing the condition of stored spent fuels has generated the need to move spent fuels to hot cell facilities within the Idaho National Engineering Laboratory (INEL). A simplified probabilistic risk assessment (SPRA) and an evaluation of the radiological consequences in the event of an accident are discussed and applied to on-site Advanced Test Reactor (AYR) spent fuel shipments. Reported accident probabilities between 10^{-4} and 10^{-6} and low radiological consequences, affords this, and other spent fuel characterization efforts, an additional option to move spent fuels within the INEL.

14917 (ANL/TD/CP–84441) **Pyrophoricity of uranium in long-term storage environments.** Solbrig, C.W.; Krsul, J.R.; Olsen, D.N. Argonne National Lab., Idaho Falls, ID (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941207–34: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95009902. Source: OSTI; NTIS; INIS; GPO Dep.

A corrosion cycle for uranium is postulated which can be used to assess whether a given storage situation might produce fire hazards and/or continual uranium corrosion. A significant reaction rate of uranium and moisture occurs at room temperature which produces uranium oxide and hydrogen. If the hydrogen cannot escape, it will react slowly with uranium to form uranium hydride. The hydride is pyrophoric at room temperature when exposed to air. Either the hydrogen or the hydride can produce a dangerous situation as demonstrated by two different incidents described here. Long-term corrosion will occur even if the normal precautions are taken as is demonstrated by the long-term storage of stainless steel clad uranium fuel plates. The major initiator of these problems is attributed to any moisture condensed on the metal or any brought in by the cover gas. The postulated corrosion cycle is used to suggest ways to circumvent these problems.

14918 (CONF-9304128–, pp. J.14-J.16) **The Westinghouse Idaho Nuclear Company (WINCO) ALARA Program.** Reavis, R. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

WINCO operates the Idaho Chemical Processing Plant (ICPP) for the Department of Energy. Since 1953 the ICPP has recovered uranium from spent nuclear fuel assemblies, largely from government owned reactors. However in 1992, the mission of the ICPP changed to one of fuel receipt, fuel storage and waste management. WINCO employs approximately 1800 personnel at the ICPP, of which approximately 1000 routinely enter radiation areas. WINCO also contracts construction to perform a variety of radiological work activities. The ALARA committee is made up of representatives from various departments involved in radiological work activities, including the work force. During this presentation, the responsibilities of the ALARA Committee are identified.

14919 (CONF-950216–119) **Summary of needs assessment for long-term planning of DOE's transportation and packaging activities.** Pope, R.B. (Oak Ridge National Lab., TN (United States)); Turi, G.; Brancato, R.; Blalock, L.; Merrill, O. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Waste management '95; Tucson, AZ (United States); 26 Feb - 2 mar 1995. Order Number DE95010285. Source: OSTI; NTIS; INIS; GPO Dep.

DOE has performed a global scoping of packaging and transportation needs to prepare for changes in its transportation requirements in the future. This needs assessment, initiated in mid-August 1994 and completed in December 1994, provides a global took at the types and quantities of materials DOE will be required to package and transport from 1995 through 2030. Results of the assessment indicate that DOE can expect a rapid increase in the shipment of radioactive and other hazardous materials during the late 1990s and on into the first decades of the 21st century. A significant increase in DOE-related packaging and transportation activities is expected as extensive waste remediation is undertaken at various DOE sites. For example, some 1400 facilities are expected to be transferred to DOE EM for decommissioning, decontamination, or other similar actions. As this occurs, the quantities of hazardous materials destined for long-term storage and/or disposal are expected to grow significantly. DOE must be prepared to accommodate these shipping needs relative to human resources, packaging, systems interfacing, logistics, regulatory compliance, training, and operations. Results of the needs assessment are expected to be used by DOE planners and managers to guide future efforts. Summary results of the Transportation Needs Assessment are outlined, presenting the findings in terms of both projected growth of shipping patterns and resulting identified human resource, software, and hardware needs–and their associated costs–that DOE needs to prepare to satisfy in the future.

14920 (DOE/RW–0462) **Notice of inquiry on waste acceptance issues: Response summary.** USDOE Office of Civilian Radioactive Waste Management, Washington, DC (United States). Mar 1995. 119p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009036. Source: OSTI; NTIS; INIS; GPO Dep.

On May 25, 1994, the Department of Energy published a Notice of Inquiry on Waste Acceptance Issues in the Federal Register. Through this Notice of Inquiry, the Department sought to implement the Secretary's initiative to explore with affected parties various options and methods for sharing the costs related to the financial burden associated with continued on-site storage by eliciting the views of affected parties on: (1) The Department's preliminary view that it does not have a statutory obligation to begin accepting spent nuclear fuel in 1998 in the absence of an operational repository or other suitable storage facility constructed under the Nuclear Waste Policy Act of 1982, as amended; (2) The need for an interim, away-from-reactor storage facility prior to repository operations; and (3) Options for offsetting, through the Nuclear Waste Fund, a portion of the financial burden that may be incurred by utilities in continuing to store spent nuclear fuel at reactor sites beyond 1998. The Department received a total of 1,111 responses representing 1,476 signatories to this Notice of Inquiry. The responses included submittals from utilities (38 responses); public utility/service commissions and utility regulators (26 responses); Federal, state, and local governments, agencies, and representatives (23 responses); industry and companies (30 responses); public interest groups and other organizations (19 responses); and members of the general public (975 responses).

14921 (IAEA-TECDOC–786) **Experience with spent fuel storage at research and test reactors. Proceedings of an advisory group meeting held in Vienna, 5-8 July 1993.** International Atomic Energy Agency, Vienna (Austria). Jan 1995. 92p. (CONF-9307217–: Advisory group meeting on experience with spent fuel storage at research and test reactors, Vienna (Austria), 5-8 Jul 1993). Order Number DE95626768. Source: OSTI; NTIS (US Sales Only); INIS.

Irradiated fuel from research and test reactors has been stored at various facilities for several decades. As these facilities age and approach or exceed their original design lifetimes, there is mounting concern about closure of the fuel cycle and about the integrity of ageing fuels from the materials point of view as well as some concern about the loss of self-protection of the fuels as their activity decays. It is clear that an international effort is necessary to give these problems sufficient exposure and to ensure that work begins on appropriate solutions. To obtain an overall picture of the size and extent of these problems, an Advisory Group Meeting on Storage Experience with Spent Fuel from Research Reactors was convened in Vienna 5-8 July 1993, and attended by twelve participants and three observers representing thirteen different countries. These proceedings contain the country reports presented at the meeting. Refs, figs and tabs.

14922 (IAEA-TECDOC–786, pp. 11-14) **Spent fuel storage at the ASTRA reactor, Seibersdorf.** Nedelik, A. (Oesterreichisches Forschungszentrum Seibersdorf GmbH, Vienna (Austria)). International Atomic Energy Agency, Vienna (Austria). Jan 1995. (CONF-9307217–: Advisory group meeting on experience with spent fuel storage at research and test reactors, Vienna (Austria), 5-8 Jul 1993). Source: OSTI; NTIS (US Sales Only); INIS.

The DR 3 reactor at Riso National Laboratory is a 10 MW PLUTO type MTR. The reactor has been operating for more than three decades and the back-end of the fuel cycle is based upon reprocessing. Storage before shipment has up to now taken place in a pool with controlled water chemistry. The lapse of reprocessing unexpectedly declared by US DOE in 1988 has caused considerable problems. First, old casks has had to be put into use as dry storage and, secondly, a dry storage facility had to be constructed. The latter is expected to be operational by the end of 1993. (author).

14925 (IAEA-TECDOC–786, pp. 33-46) **Spent fuel storage experience at the ET-RR-1 reactor in Egypt.** Saad, E.A. (Nuclear Research Centre, Inshas (Egypt). Reactor Dept.); Elsherbiny, E.M.; Sobhy, M.; Mahmoud, S.I. International Atomic Energy Agency, Vienna (Austria). Jan 1995. (CONF-9307217–: Advisory group meeting on experience with spent fuel storage at research and test reactors, Vienna (Austria), 5-8 Jul 1993). In *Experience with spent fuel storage at research and test reactors. Proceedings of an advisory group meeting held in Vienna, 5-8 July 1993.* 92p. Order Number DE95626768. Source: OSTI; NTIS (US Sales Only); INIS.

The pool type spent fuel storage is considered to be the most appropriate and flexible system. Recently, the pools which were designed to be short term storage for spent fuel became quasi-permanent storage because of the recent prohibition on reprocessing of spent fuel. One of the most economical ways to accommodate more spent fuel is to improve the efficiency of these stores making sure that the system remains subcritical as well as verifying other safety aspects. The effective multiplication factor of any array of fuel assemblies should be less than 0.95. The subcriticality in spent fuel storage facility is assured by adjusting geometric separation of the assemblies and also neutron poisons can be added. The results showed that it is quite possible to increase the capacity of Inshas reactor spent fuel store from 60 to 90 fuel elements maintaining well accepted safety margin by adding a second rack. The calculations indicated also that it is possible to store at least 50 fuel assemblies in an internal storage surrounding the ETRR-1 core. This internal storage will increase the excess reactivity of the reactor by 0.00385. This increment in the reactivity can be compensated easily by either reducing the fuel inventory in the core or by using the rod absorbers of the reactor control system. Moreover, there are attempts to construct a compact spent fuel store (wet or dry) of capacity twice that of the present storage. This capability can be increased using fixed neutron poisons. (author). 12 refs, 11 figs.

14926 (IAEA-TECDOC–786, pp. 47-52) **Storage experience with fuel from research reactors in France.** Hagemann, M. (CEA Centre d'Etudes de Saclay, 91 - Gif-sur-Yvette (France)). International Atomic Energy Agency, Vienna (Austria). Jan 1995. (CONF-9307217–: Advisory group meeting on experience with spent fuel storage at research and test reactors, Vienna (Austria), 5-8 Jul 1993). In *Experience with spent fuel storage at research and test reactors. Proceedings of an advisory group meeting held in Vienna, 5-8 July 1993.* 92p. Order Number DE95626768. Source: OSTI; NTIS (US Sales Only); INIS.

The spent fuel situation at research reactors in Germany is outlined together with legal restrictions imposed by the German Atomic Energy Act. Possible solutions including reprocessing in the United Kingdom or France, return of US origin fuel and a homegrown German solution are discussed. (author). 1 fig., 1 tab.

14928 (IAEA-TECDOC–786, pp. 59-63) **Storage experience in Hungary with fuel from research reactors.** Gado, J. (KFKI Atomic Research Inst., Budapest (Hungary)). International Atomic Energy Agency, Vienna (Austria). Jan 1995. (CONF-9307217–: Advisory group meeting on experience with spent fuel storage at research and test reactors, Vienna (Austria), 5-8 Jul 1993). In *Experience with spent fuel storage at research and test reactors. Proceedings of an advisory group meeting held in Vienna, 5-8 July 1993.* 92p. Order Number DE95626768. Source: OSTI; NTIS (US Sales Only); INIS.

In Hungary several critical assemblies, a training reactor and a research reactor have been in operation. The fuel used in the research and training reactors are of Soviet origin. Though spent fuel storage experience is fairly good, medium and long term storage solutions are needed. (author).

14929 (IAEA-TECDOC–786, pp. 65) **Experience with underwater storage of spent fuel from research reactors in India.** Sharma, S.K. (Bhabha Atomic Research Centre, Bombay (India)). International Atomic Energy Agency, Vienna (Austria). Jan 1995. (CONF-9307217–: Advisory group meeting on experience with spent fuel storage at research and test reactors, Vienna (Austria), 5-8 Jul 1993). In *Experience with spent fuel storage at research and test reactors. Proceedings of an advisory group meeting held in Vienna, 5-8 July 1993.* 92p. Order Number DE95626768. Source: OSTI; NTIS (US Sales Only); INIS.

Over 30 years of experience in the storage of irradiated fuel from research reactors exists at the Bhabha Atomic Research Centre. Experience with wet storage of metallic fuel is dealt with in this presentation. (Abstract only).

14930 (IAEA-TECDOC–786, pp. 67-73) **Present status of spent fuels in Japanese research reactors.** Sumita, K. (Osaka Univ., Osaka (Japan). Dept. of Nuclear Energy); Kodaira, T. International Atomic Energy Agency, Vienna (Austria). Jan 1995. (CONF-9307217–: Advisory group meeting on experience with spent fuel storage at research and test reactors, Vienna (Austria), 5-8 Jul 1993). In *Experience with spent fuel storage at research and test reactors. Proceedings of an advisory group meeting held in Vienna, 5-8 July 1993.* 92p. Order Number DE95626768. Source: OSTI; NTIS (US Sales Only); INIS.

Spent fuel storage at research reactors in Japan is described in outline. Reactors KUR, JRR-2 and JRR-4 have enough storage capacity at present but an increase of the storage capacity at JRR-3M and JMTR by reracking is under consideration. For the long term some consideration is being given to dry storage in casks to prevent fuel cladding corrosion. (author). 3 tabs.

14931 (IAEA-TECDOC–786, pp. 75-81) **The problems of treatment of irradiated fuel at Russian research reactors.** Arkhanguelskij, N.V. (Ministry of Atomic Energy of the Russian Federation, Moscow (Russian Federation)). International Atomic Energy Agency, Vienna (Austria). Jan 1995. (CONF-9307217–: Advisory group meeting on experience with spent fuel storage at research and test reactors, Vienna (Austria), 5-8 Jul 1993). In *Experience with spent fuel storage at research and test reactors. Proceedings of an advisory group meeting held in Vienna, 5-8 July 1993.* 92p. Order Number DE95626768. Source: OSTI; NTIS (US Sales Only); INIS.

This report describes the problems of safety during the storage and transportation of spent fuel from Russian research reactors. Many research reactors continue to operate in Russia at THE present time. They use many different types of fuel elements and assemblies. The questions of safety during storage and transportation of spent fuel from research reactors is considered in Russian documents on the safety of research reactors. The main features of these documents are described in this report. Three stages of the storage and transportation of spent fuel are discussed: the temporary storage in the pool or in the vessel; the storage in the repository on the territory of the institutes; and the transportation of the fuel to the reprocessing plant. The future plans provide for the solution of the problems of transportation and reprocessing of all types of fuel assemblies which are used in Russian research reactors and experimental facilities. Also, there is an intention to continue the work on reducing the enrichment of the fuel for research reactors and to change the fuel composition from uranium dioxide in an aluminium matrix to uranium silicide in aluminium matrix. (author). 4 refs, 4 figs, 1 tab.

14932 (IAEA-TECDOC–786, pp. 83-90) **Fuel storage handling at the R2 reactor at Studsvik.** Jonsson, E.B. (Studsvik Nuclear, Nykoeping (Sweden)). International Atomic Energy Agency, Vienna (Austria). Jan 1995. (CONF-9307217–: Advisory group meeting on experience with spent fuel storage at research and test reactors, Vienna (Austria), 5-8 Jul 1993). In *Experience with spent fuel storage at research and test reactors. Proceedings of an advisory group meeting held in Vienna, 5-8 July 1993.* 92p. Order Number DE95626768. Source: OSTI; NTIS (US Sales Only); INIS.

The Swedish 50 MW(th) high flux reactor R2 has been in operation since 1960. The reactor has during these 33 years used more than 1300 fuel assemblies. The HEU (high enriched uranium) fuel is gradually replaced by LEU (low enriched uranium) fuel. From the operating point of view the same rules on transport and storage are valid for both HEU and LEU assemblies. Before, during and after irradiation the fuel assemblies are stored in a fresh assembly dry storage vault, in the reactor pool and core and in an intermediate storage pool outside the containment, respectively. Final disposal of the fuel assemblies has been through reprocessing by USDOE. It is essential for a safe storage of the assemblies that they are: kept in a critically safe configuration; effectively separated from the public (radiation protection); kept under good ageing conditions, easily safeguard controlled. (author). 6 figs.

14933 (IAEA-TSRA–2) **Transport safety research abstracts. No. 2. Information on research recently concluded and in progress.** International Atomic Energy Agency, Vienna (Austria). Sep 1994. 86p. Order Number DE95626769. Source: OSTI; NTIS (US Sales Only); INIS.

Transport Safety Research Abstracts (TSRA) was first published by the IAEA in 1991 as a means of disseminating information on research in radioactive material transport. This second edition utilizes International Nuclear Information System (INIS) protocol for data processing and report preparation for a research-in-progress database established by the IAEA's Division of Scientific and Technical Information. INIS subject categories and descriptors are included in the information about each project.

14934 (K/TCD–1057) **Preliminary investigation of steel compatibility with potential materials of construction for UF6 cylinder chocks.** Pawel, S.J.; Ziehlke, K.T.; Swindeman, C.J. Oak Ridge K-25 Site, TN (United States). Dec 1992. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009569. Source: OSTI; NTIS; GPO Dep.

A set of compatibility experiments was performed to assess corrosion susceptibility of mild steel in long term contact with UF_6 cylinder chocking materials and the atmosphere. Chock materials considered included concrete, pressure-treated wood, and creosote-treated wood. Immersion tests (panels partially submerged, 1000 h, 38 C), resistance probe measurements (600 h, ambient), and cyclic polarization tests on steel in leachate solutions generated from each chock material were performed. Results indicate that the long term corrosion susceptibility of mild steel in contact with concrete and the atmosphere is at least the equivalent of – and under some conditions superior to – that for steel in contact with pressure-treated or creosote-treated wood. No corrosion-related limitation for concrete chocks for long term support of mild steel UF_6 cylinders was identified.

14935 (NUREG/CR–5625) **Technical support for a proposed decay heat guide using SAS2H/ORIGEN-S data.** Hermann, O.W. (Oak Ridge National Lab., TN (United States)); Parks, C.V.; Renier, J.P. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; Oak Ridge National Lab., TN (United States). Sep 1994. 116p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL–6698). Source: OSTI; NTIS; INIS.

Major revisions are proposed to the current US Nuclear Regulatory Commission decay heat rate guide entitled "Regulatory Guide 3.54, Spent Fuel Heat Generation in an Independent Spent Fuel Storage Installation," using a new data base produced by the SAS2H analysis sequence of the SCALE-4 system. The data base for the proposed guide revision has been significantly improved by increasing the number and range of parameters that generally characterize pressurized-water-reactor (PWR) and boiling-water-reactor (BWR) spent fuel assemblies. Using generic PWR and BWR assembly models, calculations were performed with each model for six different burnups at each of three separate specific powers to produce heat rates at 20 cooling times in the range of 1 to 110 y. The proposed procedure specifies proper interpolation formulae for the tabulated heat generation rates. Adjustment formulae for the interpolated values are provided to account for differences in initial ^{235}U enrichment and changes in the specific power of a cycle from the average value. Finally, safety factor formulae were derived as a function of burnup, cooling time, and type of reactor. The proposed guide revision was designed to be easier to use. Also, the complete data base and guide procedure is incorporated into an interactive code called LWRARC which can be executed on a personal computer. The report shows adequate comparisons of heat rates computed by SAS2H/ORIGEN-S and measurements for 10 BWR and 10 PWR fuel assemblies. The average differences of the computed minus the measured heat rates of fuel assemblies were $-07 \pm 2.6\%$ for the BWR and $1.5 \pm 1.3\%$ for the PWR. In addition, a detailed analysis of the proposed procedure indicated the method and equations to be valid.

14936 (SAND–95-0143C) **Research and Development Program for transportation packagings at Sandia National Laboratories.** Hohnstreiter, G.F.; Sorenson, K.B. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950646–6: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95006819. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains information about the research and development programs dealing with waste transport at Sandia National Laboratories. This paper discusses topics such as: Why new packaging is needed; analytical methodologies and design codes;evaluation of packaging components; materials characterization; creative packaging concepts; packaging engineering and analysis; testing; and certification support.

14937 (STUK-YTO-TR–55) **SFAT geometry verification measurements at the TVO KPA-STORE. Interim report on Task FIN A563 of the Finnish Support Programme to IAEA Safeguards.** Tiitta, A.; Kaita, K.; Tarvainen, M. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Jul 1993. 26p. Order Number DE95627933. Source: OSTI; NTIS; INIS.

Experiments made for the confirmation of the measurement geometry of the Spent Fuel Attribute Tester (SFAT), performed in December 1992, are reported and analysed. The measurement geometry to be chosen for a commercial prototype can be confirmed to be close enough to the optimum and to give a satisfactory signal-to-noise ratio. The problems encountered during the determination of the signal-to-noise ratio of Cs^{137} peaks rise to recommendation of developing new algorithms for processing NaI(Tl) detector spectra. (orig.) (7 refs., 11 figs., 5 tabs.).

14938 (WHC-SA–2491) **Packaging and transportation of radioactive liquid at the U.S. Department of Energy Hanford Site.** Smith, R.J. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950426–1: 3. international conference on nuclear engineering, Kyoto (Japan), 23-27 Apr 1995). Order Number DE95007791. Source: OSTI; NTIS; INIS; GPO Dep.

Beginning in the 1940's, radioactive liquid waste has been generated at the US Department of Energy (DOE) Hanford Site as a result of defense material production. The liquid waste is currently stored in 177 underground storage tanks. As part of the tank remediation efforts, Type B quantity packagings for the transport of large volumes of radioactive liquids are required. There are very few Type B liquid packagings in existence because of the rarity of large-volume radioactive liquid payloads in the commercial nuclear industry. Development of aboveground transport systems for large volumes of radioactive liquids involves institutional, economic, and technical issues. Although liquid shipments have taken place under DOE-approved controlled conditions within the boundaries of the Hanford Site for many years, offsite shipment requires compliance with DOE, US Nuclear Regulatory Commission (NRC), and US Department of Transportation (DOT) directives and regulations. At the present time, no domestic DOE nor NRC-certified Type B packagings with the appropriate level of shielding are available for DOT-compliant transport of radioactive liquids in bulk volumes. This paper will provide technical details regarding current methods used to transport such liquids on and off the Hanford Site, and will provide a status of packaging development programs for future liquid shipments.

14939 (WHC-SD-CP-SAR–021-Vol.1) **Plutonium finishing plant final safety analysis report. Volume 1.** Shapley, J.E. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 1327p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009101. Source: OSTI; NTIS; INIS; GPO Dep.

This Final Safety Analysis Report was approved by DOE-HQ on January 6, 1995. It replaces 14 older PFP safety analysis and incorporates several Safety Assessment Documents prepared in 1993 and 1994. A draft of this document dated January 1991 has been circulated – all pages of the approved Revision 0 are dated January 1995. Additionally, approval of this document by DOE-HQ closes an Unreviewed Safety Question related to 232-Z Incinerator Building that was identified in August, 1994. This document and its companion document, WHC-SD-CP-OSR-010, "Plutonium Finishing Plant Operational Safety Requirements," are the primary references for definition of the Plutonium Finishing Plant (PFP) safety authorization basis.

14940 (WHC-SD-CP-SAR–021-Vol.2) **Plutonium finishing plant final safety analysis report. Volume 2.** Shapley, J.E. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 1275p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009102. Source: OSTI; NTIS; INIS; GPO Dep.

This Final Safety Analysis Report was approved by DOE-HQ on January 6, 1995. It replaces 14 older PFP safety analysis and incorporates several Safety Assessment Documents prepared in 1993 and 1994. 14941 (WHC-SD-SNF-CSER–001-Rev.1) **Basis for criticality category B firefighting designation for K Basins. Revision 1.** Jensen, M.A. Westinghouse Hanford Co., Richland, WA (United States). 23 Mar 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010055. Source: OSTI; NTIS; INIS; GPO Dep.

This Supporting Document analyzes the various fissile material configurations in the 105-K East and K West fuel storage basins to determine the proper firefighting category. Firefighting categories are assigned to fissionable material facilities to provide guidance to firefighters in the allowable uses of water and other extinguishing materials to prevent inadvertent rearrangement of fissile materials or addition of neutron moderators which could lead to a criticality. This document concludes the appropriate category is B, which does not impose any restrictions on the use of water for firefighting purposes.

14942 (WHC-SD-SNF-DR–001) **Design support document for the K Basins Vertical Fuel Handling Tools.** Bridges, A.E. Westinghouse Hanford Co., Richland, WA (United States). 7 Mar 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008805. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to provide the design support information for the Vertical Fuel Handling Tools, developed for the removal of N Reactor fuel elements from their storage canisters in the K Basins storage pool and insertion into the Single Fuel Element Can for subsequent shipment to a Hot Cell for examination. Examination of these N Reactor fuel elements is part of the overall characterization effort. These new hand tools are required since previous fuel movement has involved grasping the fuel in a horizontal position. These tools are required to lift an element vertically from the storage canister. Additionally, a Mark II storage canister Lip Seal Protector was designed and fabricated for use during fuel retrieval. This device was required to prevent damage to the canister lip should a fuel element accidentally be dropped during its retrieval, using the handling tools. Supporting documentation for this device is included in this document.

14943 (WHC-SD-SNF-SM–002) **Choices of canisters and elements for the first fuel shipment from K West Basin.** Makenas, B.J. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008806. Source: OSTI; NTIS; INIS; GPO Dep.

Twenty-two canisters (10 prime and 12 backup candidates) in the K West Basin have been identified as containing fuel which, when examined, will satisfy the Data Quality Objectives for the first fuel shipment from this basin. These were chosen as meeting criteria such as containing relatively long fuel elements, locking bar integrity, and the availability of gas/liquid interface level measurements for associated canister gas traps. Two canisters were identified as having reported broken fuel on initial loading. Usage and interpretation of canister cesium concentration measurements have also been established and levels of maximum and minimum acceptable cesium concentration (from a data optimization point of view) for decapping have been determined although other operational cesium limits may also apply. Criteria for picking particular elements, once a canister is opened, are reviewed in this document. A pristine, a slightly damaged, and a badly damaged element are desired. The latter includes elements with end caps removed but does not include elements which have large amounts of swelling or split cladding that might interfere with handling tools. Finally, operational scenarios have been suggested to aid in the selections of canisters and elements in a way that utilizes anticipated canister gas sampling and leads to a correct and quick choice of elements which will supply the desired data.

14944 (WHC-SD-SQA-CSA–20393) **CSER 95-002: ALARA shielding for IAEA SNM container movement.** Miller, E.M. Westinghouse Hanford Co., Richland, WA (United States). 7 Mar 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008890. Source: OSTI; NTIS; INIS; GPO Dep.

This CSER qualifies use of a 5% borated, lead foil lined polyethylene 1 inch annulus as a bucket and in a small carrier to move sealed containers of plutonium. The containers are Oversize Cans or smaller containing plutonium limited in mass and H/Pu ratio by PFP storage and transportation CPS's. These ALARA shielding units reduce personnel exposure to the radiation from the containers as they are moved for assay and other required activities.

14945 (WHC-SD-TP-SWD–004) **Automated Transportation Management System (ATMS) V2.0 logistics module PBI acceptance criteria.** Weidert, R.S. Westinghouse Hanford Co., Richland, WA (United States). 28 Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008882. Source: OSTI; NTIS; INIS; GPO Dep.

This document defines the acceptance criteria for the Automated Transportation Management System V2.0 Logistics Module Performance Based Incentive (PBI). This acceptance criteria will be the primary basis for the generation of acceptance test procedures. The purpose of this document is to define the minimum criteria that must be fulfilled to guarantee acceptance of the Logistics Module.

14946 (WHC-SD-WM-PROC–019) **Assembly procedure for Shot Loading Platform.** Routh, R.D. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009153. Source: OSTI; NTIS; INIS; GPO Dep.

This supporting document describes the assembly procedure for the Shot Loading Platform. The Shot Loading Platform is used by multiple equipment removal projects to load shielding shot in the annular spaces of the equipment storage containers. The platform height is adjustable to accommodate different sizes of storage containers and transport assemblies.

14947 (DOE/IG–0368) **Report on audit of the Richland Operations Office Site Characterization Program.** USDOE Office of Inspector General, Washington, DC (United States). Mar 1995. 17p. Sponsored by USDOE, Washington, DC (United States). Source: OSTI (Free of Charge).

In 1989 the Secretary of Energy changed the mission of the Richland Operations Office (ROO) from supporting weapons production to environmental restoration and waste management. Through the Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement), ROO was required to survey Hanford for contaminants, analyze samples, and determine the most cost-effective method to clean up the waste identified. The objective of this audit was to determine if the Department of Energy (DOE) and ROO had evaluated alternatives to accomplish certain site characterization activities in a cost-effective manner. This audit showed that neither the DOE nor ROO evaluated alternatives to ensure that two site characterization activities were accomplished in a cost-effective manner. First, DOE accelerated the core sampling program for high-level radioactive waste tanks from 6 to 3 years. DOE made this decision in response to a Defense Nuclear Facilities Safety Board (Safety Board) recommendation without first determining if the method chosen (core sampling) was the most efficient and economical method to satisfy the Safety Board's concerns. This 3-year acceleration would cost over $71 million with little increase in benefits. Second, ROO agreed to a Tri-Party Agreement Amendment to require low-level waste samples be analyzed within 25 miles of Hanford. ROO estimated that the 25-mile restriction will require an additional $46 million over an 8-year period. It is recommended that DOE (1) notify the appropriate parties that characterization of the high-level radioactive waste tanks will be completed in the most cost-effective method to achieve program objectives, and (2) negotiate to remove the requirement to perform 80% of low-level waste sample analyses within 25 miles of Hanford. It is also recommended that management perform economic analyses of alternatives before making decisions as to how program objectives will be accomplished.

14948 (ANL/CMT/CP–83588) **Removal of actinide elements from liquid scintillation cocktail wastes using liquid-liquid extraction and demulsification techniques.** Foltz, K. (Univ. of Illinois, Urbana, IL (United States)); Landsberger, S.; Srinivasan, B.; Vandegrift, G.F. Argonne National Lab., IL (United States). [1994]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941102–41: Winter meeting of the American Nuclear Society, Washington, DC (United States), 13-18 Nov 1994). Order Number DE95009897. Source: OSTI; NTIS; INIS; GPO Dep.

For many years liquid scintillation cocktail (LSC) wastes have been generated and stored at Argonne National Laboratory (ANL). These wastes are stored in thousands of 10–20 m scintillation vials, many of which contain elements with $Z > 88$. Because storage space is limited, disposal of this waste is pressing. These wastes could be commercially incinerated if the radionuclides with $Z>88$ are reduced to sufficiently low levels. However, there is currently no deminimus level for these radionuclides, and separation techniques are still being tested. The University of Illinois is conducting experiments to separate radionuclides with $Z > 88$ from simulated LSC wastes by using liquid-liquid extraction (LLX) and demulsification techniques. The actinide elements are removed from the LSC by extraction into an aqueous phase after the cocktail has been demulsified. The aqueous and organic phases are separated and the organic phase, now free from radionuclides with $Z > 88$, can be sent to a commercial incineration facility. The aqueous phase may be treated and disposed of using existing techniques. The LLX separation techniques used solutions of sodium oxalate, aluminum nitrate, and tetrasodium EDTA at varying concentrations. These extractants were mixed with the simulated waste in a 1:1 volume ratio. Using 1.0M Na_4 EDTA salt solutions, decontamination ratios as high as 230 were achieved.

14949 (ANL/CMT/CP–83895) **Behavior of spent fuel under unsaturated conditions.** Finn, P.A. (Argonne National Lab., IL (United States). Chemical Technology Div.); Hoh, J.C.; Bates, J.K.; Wolf, S.F. Argonne National Lab., IL (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941207–33: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95009899. Source: OSTI; NTIS; INIS; GPO Dep.

To evaluate the performance of spent fuel in the potential repository at Yucca Mountain, Nevada, spent fuel fragments are being exposed to small and intermittent amounts of simulated groundwater under unsaturated conditions. Both the leachate and the visual appearance of the spent fuel have been characterized for 581 days of testing. The amount of Am and Cm measured in the leachates was one to two orders of magnitude greater than that released from spent fuel under saturated conditions. The cause of this difference has not been firmly identified but may be attributable to the presence of large amounts of actinide-containing colloids in the leachate of the unsaturated tests.

14950 (ANL/CMT/CP–84354) **Pyroprocessing oxide spent nuclear fuels for efficient disposal.** McPheeters, C.C. (Argonne National Lab., IL (United States). Chemical Technology Div.); Pierce, R.D.; Mulcahey, T.P. Argonne National Lab., IL (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941207–31: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95009901. Source: OSTI; NTIS; INIS; GPO Dep.

Pyrochemical processing as a means for conditioning spent nuclear fuels for disposal offers significant advantages over the direct disposal option. The advantages include reduction in high-level waste volume; conversion of most of the high-level waste to a low-level waste in which nearly all the transuranics (TRU) have been removed; and incorporation of the TRUs into a stable, highly radioactive waste form suitable for interim storage, ultimate destruction, or repository disposal. The lithium process has been under development at Argonne National Laboratory for use in pyrochemical conditioning of spent fuel for disposal. All of the process

steps have been demonstrated in small-scale (0.5-kg simulated spent fuel) experiments. Engineering-scale (20-kg simulated spent fuel) demonstration of the process is underway, and small-scale experiments have been conducted with actual spent fuel from a light water reactor (LWR). The lithium process is simple, operates at relatively low temperatures, and can achieve high decontamination factors for the TRU elements. Ordinary materials, such as carbon steel, can be used for process containment.

14951 (ANL/EA/CP–84147) **Assessment of transportation risk for the U.S. Department of Energy Environmental Management programmatic environmental impact statement.** Chen, S.Y.; Monette, F.A.; Biwer, B.M.; Lazaro, M.A.; Hartmann, H.M.; Policastro, A.J. Argonne National Lab., IL (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–103: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008285. Source: OSTI; NTIS; INIS; GPO Dep.

In its Programmatic Environmental Impact Statement (PEIS), the Office of Environmental Management (EM) of the U.S. Department of Energy (DOE) is considering a broad range of alternatives for the future management of radioactive and hazardous waste at the facilities of the DOE complex. The alternatives involve facilities to be used for treatment, storage, and disposal of various wastes generated from DOE environmental restoration activities and waste management operations. The evaluation includes five types of waste (four types of radioactive waste plus hazardous waste), 49 sites, and numerous cases associated with each alternative for waste management. In general, the alternatives are evaluated independently for each type of waste and reflect decentralized, regionalized, and centralized approaches. Transportation of waste materials is an integral component of the EM PEIS alternatives for waste management. The estimated impact on human health that is associated with various waste transportation activities is an important component of a complete appraisal of the alternatives. The transportation risk assessment performed for the EM PEIS is designed to ensure through uniform and judicious selection of models, data, and assumptions that relative comparisons of risk among the various alternatives are meaningful and consistent. Among other tasks, Argonne National Laboratory is providing technical assistance to the EM PEIS on transportation risk assessment. The objective is to perform a human health risk assessment for each type of waste relative to the EM PEIS alternatives for waste management. The transportation risk assessed is part of the overall impacts being analyzed for the EM PEIS to determine the safest, most environmentally and economically sound manner in which to satisfy requirements for waste management in the coming decades.

14952 (ANL/EA/CP–84165) **Development of chemical profiles for U.S. Department of Energy low-level mixed wastes.** Wang, Y.Y.; Wilkins, B.D.; Meshkov, N.K.; Dolak, D.A. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–102: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008284. Source: OSTI; NTIS; INIS; GPO Dep.

Chemical and radiological profiles of waste streams from US Department of Energy (DOE) low-level mixed wastes (LLMWs) have been developed by Argonne National Laboratory (ANL) to provide technical support information for evaluating waste management alternatives in the Office of Environmental Management Programmatic Environmental Impact Statement (EM PEIS). The chemical profiles were developed for LLMW generated from both Waste Management (WM) operations and from Environmental Restoration (ER) activities at DOE facilities. Information summarized in the 1994 DOE Mixed Waste Inventory Report (MWIR-2), the Pacific Northwest Laboratory (PNL) Automated Remedial Assessment Methodology (ARAM), and associated PNL supporting data on ER secondary waste streams that will be treated in WM treatment facilities were used as the sources for developing chemical profiles. The methodology for developing the LLMW chemical profiles is discussed, and the chemical profiles developed from data for contact-handled (CH) non-alpha LLMW are presented in this paper. The hazardous chemical composition of remote-handled (RH) LLMW and alpha LLMW follow the chemical profiles developed for CH non-alpha LLMW.

14953 (ANL/EA/CP–85594) **Development of radiological profiles for U.S. Department of Energy low-level mixed wastes.** Wilkins, B.D.; Meshkov, N.K.; Dolak, D.A.; Wang, Y.Y. Argonne National Lab., IL (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–100: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008280. Source: OSTI; NTIS; INIS; GPO Dep.

Radiological profiles have been developed by Argonne National Laboratory for low-level mixed wastes (LLMWs) that are under the management of the US Department of Energy (DOE). These profiles have been used in the Office of Environmental Management Programmatic Environmental Impact Statement (EM PEIS) to support the analysis of environmental and health risks associated with the various waste management strategies. The radiological characterization of DOE LLMWs is generally inadequate and has made it difficult to develop a site- and waste-stream-dependent radiological profile for LLMWs. On the basis of the operational history of the DOE sites, a simple model was developed to generate site-dependent and waste-stream-independent radiological profiles for LLMWs. This paper briefly discusses the assumptions used in this model and the uncertainties in the results.

14954 (ANL/EA/CP–85596) **The modeling of contaminant flow during proposed treatment of U.S. Department of Energy low-level radioactive mixed wastes.** Dolak, D.A.; Wilkins, B.D.; Kotek, T.J.; Wang, Y.Y.; Meshkov, N.K. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–101: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008281. Source: OSTI; NTIS; INIS; GPO Dep.

Estimations of waste materials throughput and the potential radiological and chemical releases resulting from the proposed treatment of US Department of Energy (DOE) low-level mixed wastes (LLMWs) were used to support analyses of risks and costs associated with various waste management alternatives outlined in the Office of Environmental Management Programmatic Environmental Impact Statement (EM PEIS). The modeling of material flow and contaminant releases through a consolidated waste management flowchart was performed by the WASTE_MGMT computational model developed by Argonne National Laboratory. This paper (1) briefly describes the process used to model estimated material and contaminant flow through the proposed treatment scenarios for the EM PEIS, (2) discusses the key site- and/or waste-stream-dependent factors involved in the determination of radiological and chemical emissions, and (3) explains the assumptions used to integrate the available LLMW database with the computational model.

14955 (ANL/TD/CP–84268) **Argonne-West facility requirements for a radioactive waste treatment demonstration.** Dwight, C.C.; Felicione, F.S.; Black, D.B.; Kelso, R.B.; McClellan, G.C. Argonne National Lab., IL (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–108: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008291. Source: OSTI; NTIS; INIS; GPO Dep.

At Argonne National Laboratory-West (ANL-W), near Idaho Falls, Idaho, facilities that were originally constructed to support the development of liquid-metal reactor technology are being used and/or modified to meet the environmental and waste management research needs of DOE. One example is the use of an Argonne-West facility to conduct a radioactive waste treatment demonstration through a cooperative project with Science Applications International Corporation (SAIC) and Lockheed Idaho Technologies Company. The Plasma Hearth Process (PBP) project will utilize commercially-adapted plasma arc technology to demonstrate treatment of actual mixed waste. The demonstration on radioactive waste will be conducted at Argonne's Transient Reactor Test Facility (TREAT). Utilization of an existing facility for a new and different application presents a unique set of issues in meeting applicable federal state, and local requirements as well as the

additional constraints imposed by DOE Orders and ANL-W site requirements. This paper briefly describes the PHP radioactive demonstrations relevant to the interfaces with the TREAT facility. Safety, environmental design, and operational considerations pertinent to the PHP radioactive demonstration are specifically addressed herein. The personnel equipment, and facility interfaces associated with a radioactive waste treatment demonstration are an important aspect of the demonstration effort. Areas requiring significant effort in preparation for the PBP Project being conducted at the TREAT facility include confinement design, waste handling features, and sampling and analysis considerations. Information about the facility in which a radioactive demonstration will be conducted, specifically Argonne's TREAT facility in the case of PHP, may be of interest to other organizations involved in developing and demonstrating technologies for mixed waste treatment.

14956 (BARC–1994/E/014) **Partitioning of actinide from simulated high level wastes arising from reprocessing of PHWR fuels: counter current extraction studies using CMPO.** Deshingkar, D.S. Process Engineering and Systems Development Div.); Chitnis, R.R.; Wattal, P.K.; Theyyunni, T.K.; Nair, M.K.T.; Ramanujam, A.; Dhami, P.S.; Gopalakrishnan, V.; Rao, M.K.; Mathur, J.N.; Murali,Bhabha Atomic Research Centre, Bombay (India). 1994. 43p. Order Number DE95628049. Source: OSTI; NTIS (US Sales Only); INIS.

High level wastes (HLW) arising from reprocessing of pressurised heavy water reactor (PHWR) fuels contain actinides like neptunium, americium and cerium which are not extracted in the Purex process. They also contain small quantities of uranium and plutonium in addition to fission products. Removal of these actinides prior to vitrification of HLW can effectively reduce the active surveillance period of final waste form. Counter current studies using indigenously synthesised octyl (phenyl)-N, N-diisobutylcarbamoylmethylphosphine oxide (CMPO) were taken up as a follow-up of successful runs with simulated sulphate bearing low acid HLW solutions. The simulated HLW arising from reprocessing of PHWR fuel was prepared based on presumed burnup of 6500 MWd/Te of uranium, 3 years cooling period and 800 litres of waste generation per tonne of fuel reprocessed. The alpha activity of the HLW raffinate after extraction with the CMPO-TBP mixture could be brought down to near background level. (author). 13 refs., 2 tabs., 12 figs.

14957 (CEA-CONF–11923) **Vitrification of radioactive waste. Application to other kinds of waste.** Jouan, A. CEA Centre d'Etudes de la Vallee du Rhone, 30 - Marcoule (France). Dept. des Procedes de Retraitement. 1993. 19p. (In French). (CONF-9301158–: Meeting on training for conditioning and characterization of waste, Manosque (France), 26-28 Jan 1993). Order Number DE95627043. Source: OSTI; NTIS (US Sales Only); INIS.

The containment by vitrification of radioactive waste is applied to concentrate solutions of fission products coming from the spent fuel reprocessing. By the way of liquid state to solid state, it is possible to reduce the volume of waste, to get a material with safety guarantees necessary to long storage and the glass by its chemical resistance, its thermal stability and its well resistance to irradiation answers particularly well to these necessities.

14958 (CONF-9304128–, pp. I.2) **Containment development at Paducah Gaseous Diffusion Plant.** O'Connell, J. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The history of containment development at Paducah Gaseous Diffusion Plant will be presented. Several methods of controlling contamination at the source will be shown. The benefits of the implementation of specific source controls include limiting worker exposure to both chemical and radiological contamination. In addition, workers have been able to remove anti-contamination clothing and respirators reducing heat stress and improving productivity while reducing waste. As a result several areas which were maintained as contaminated areas have been down-posted. The creation of a Contamination Source Containment Committee has been a major factor in containment development. The workings of this committee will be explained and future containment plans will be presented.

14959 (CONF-9304128–, pp. H.23-H.30) **Mixed waste removal from a hazardous waste storage tank.** Geber, K.R. (Oak Ridge National Lab., TN (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. DOE Contract AC05-84OR21400. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

The spent fuel transfer canal at the Oak Ridge Graphite Reactor was found to be leaking 400 gallons of water per day into the surrounding soil. Sampling of the sediment layer on the floor of the canal to determine the environmental impact of the leak identified significant radiological contamination and elevated levels of cadmium and lead which are hazardous under the Resource Conservation and Recovery Act (RCRA). Under RCRA regulations and Rules of Tennessee Department of Environment and Conservation, the canal was considered a hazardous waste storage tank. This paper describes elements of the radiological control program established in support of a fast-track RCRA closure plan that involved underwater mapping of the radiation fields, vacuuming, and ultrafiltration techniques that were successfully used to remove the mixed waste sediments and close the canal in a method compliant with state and federal regulations.

14960 (CONF-9304128–, pp. H.31-H.53) **Tank 241-CX-70 waste removal and packaging.** DuVon, D. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Tank 241-CX-70 is a 30,000 gallon single-shell storage tank built in 1952 to hold high level process waste from pilot tests of the reduction-oxidation (REDOX) process. The tank is constructed of 1/4 inch stainless steel plate 15 feet in depth and 20 feet in diameter and is buried approximately 14 feet below grade. The tank is surrounded by 1 foot of poured concrete on the top and sides with a concave bottom thickness varying from 9 inches in the center to 2 feet at the edge. There are 9 risers extending above ground and a man-way 42 inches in diameter. The tank is located 128 feet South-East of the Strontium Semiworks area in the 200 East Area of the Hanford Site. In 1979 decommissioning operations were begun by pumping liquid waste from the tank to the double-shell tank 101-AY. Not all the wastes was removed at that time. Approximately 10,300 gallons of sludge remained.

14961 (CONF-940815–112) **Mercury removal from solid mixed waste.** Gates, D.D.; Morrissey, M.; Chava, K.K.; Chao, K. Oak Ridge National Lab., TN (United States). [1994]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From International nuclear and hazardous waste management conference; Atlanta, GA (United States); 14-18 Aug 1994. Order Number DE95008846. Source: OSTI; NTIS; INIS; GPO Dep.

The removal of mercury from mixed wastes is an essential step in eliminating the temporary storage of large inventories of mixed waste throughout the Department of Energy (DOE) complex. Currently thermal treatment has been identified as a baseline technology and is being developed as part of the DOE Mixed Waste Integrated Program (MWIP). Since thermal treatment will not be applicable to all mercury containing mixed waste and the removal of mercury prior to thermal treatment may be desirable, laboratory studies have been initiated at Oak Ridge National Laboratory (ORNL) to develop alternative remediation technologies capable of removing mercury from certain mixed waste. This paper describes

laboratory investigations of the KI/I_2 leaching processes to determine the applicability of this process to mercury containing solid mixed waste.

14962 (CONF-941144–107) **Performance of cement-based seal-system components in a waste-disposal environment.** Malone, P.G. (US Army Engineer Waterways Experiment Station, Vicksburg, MS (United States)); Wakeley, L.D.; Burkes, J.P.; McDaniel, E.W. Oak Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AI05-90OR21921. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95008840. Source: OSTI; NTIS; INIS; GPO Dep.

A grout based on portland cement, Class F fly ash, and bentonite clay was developed as part of the closure system of shallow subsurface structures for disposal of low-activity radioactive wastes. Heat output, volume change, and compressive strength of the sealing grout were monitored with time, at elevated temperature, and in physical models, to determine if this closure grout could maintain adequate volume stability and other required physical properties in the internal environment of the disposal structure. To determine if contact with an alkaline liquid waste would cause chemical deterioration of the sealing grout, cured specimens were immersed in a liquid waste simulant containing high concentrations of sodium and aluminum salts. After 21 days at 60 C, specimens increased in mass without significant changes in volume. XRD revealed crystallization of sodium aluminum silicate hydrate. The new phase has an XRD pattern similar to the commercial synthetic zeolite Losod. Scanning electron microscopy used with x-ray fluorescence showed that clusters of this phase had formed in grout pores, to increase rout density and decrease its effective porosity. Testing was repeated at 100 C for 5 days using a simulant containing sodium hydroxide and aluminum nitrate and results were similar. Physical and chemical tests indicate acceptable performance of this grout as a seal-system component.

14963 (CONF-950216–95) **Integration of remediation strategy with waste management capabilities and regulatory drivers for radioactive waste storage tanks at the Oak Ridge National Laboratory.** Baxter, J.T. (H&R Technical Associates, Inc., Oak Ridge, TN (United States)); Hepworth, H.K.; Hooyman, J.H. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Waste management '95; Tucson, AZ (United States); 26 Feb - 2 mar 1995. Order Number DE95009174. Source: OSTI; NTIS; INIS; GPO Dep.

This paper addresses the plans and strategies for remediation of the Liquid Low-Level Waste (LLLW) system tanks that have been removed from service at the Oak Ridge National Laboratory (ORNL). The Superfund Amendments and Reauthorization Act of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) requires a Federal Facility Agreement (FFA) for federal facilities placed on the National Priorities List. The Oak Ridge Reservation was placed on that list on December 21, 1989, and the agreement was signed in November 1991 by the U.S. Department of Energy Oak Ridge Operations Office (DOE-ORO), the EPA-Region IV, and the Tennessee Department of Environment and Conservation (TDEC). The effective date of the FFA is January 1, 1992. One requirement of the FFA is that LLLW tanks that are removed from service must be evaluated and remediated through the CERCLA process. The Environmental Restoration Program intends to meet this requirement by using a "streamlined' approach for selected tanks. This approach will combine the CERCLA Site Investigation. Remedial Action, Feasibility Study, and Proposed Plan requirements into a single Interim Proposed Plan document. This streamlined approach is expected to reduce the time required to complete the regulatory process while attaining acceptable risk reduction in a cost-effective way.

14964 (CONF-950232–31) **Test bed control center design concept for Tank Waste Retrieval Manipulator Systems.** Sundstrom, E. (Human Machine Interfaces, Inc., Knoxville, TN (United States)); Draper, J.V.; Fausz, A. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 6. American Nuclear Society meeting on robotics and remote systems; Monterey, CA (United States); 5-10 Feb 1995. Order Number DE95006391. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the design concept for the control center for the Single Shell Tank Waste Retrieval Manipulator System test bed and the design process behind the concept. The design concept supports all phases of the test bed mission, including technology demonstration, comprehensive system testing, and comparative evaluation for further development and refinement of the TWRMS for field operations.

14965 (CONF-950740–15) **In-tank fluid sloshing effects during earthquakes: A preliminary computational simulation.** Park, J.E.; Rezvani, M.A. Oak Ridge National Lab., TN (United States). [1995]. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessels and piping conference; Honolulu, HI (United States); 23-27 Jul 1995. Order Number DE95008902. Source: OSTI; NTIS; GPO Dep.

Hundreds of underground radioactive waste storage tanks are located at Department of Energy (DOE) sites. At present, no technique for evaluating the pressure loads due to the impact of earthquake generated waves on the side walls and dome of the tanks is known if the wave breaks back on itself. This paper presents the results of two-dimensional Computational Fluid Dynamics (CFD) calculations of the motion of waves in a generic rectangular tank as the result of accelerations recorded during an earthquake. The advantages and limitations of this technique and methods for avoiding the limitations will be discussed.

14966 (DOE/EA–0906) **Waste Characterization Facility at the Idaho National Engineering Laboratory. Environmental Assessment.** USDOE Idaho Operations Office, Idaho Falls, ID (United States). Feb 1995. 48p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-76ID01570. Order Number DE95009932. Source: OSTI; NTIS; INIS; GPO Dep.

DOE has prepared an Environmental Assessment (EA) on the proposed construction and operation of a Waste Characterization Facility (WCF) at INEL. This facility is needed to examine and characterize containers of transuranic (TRU) waste to certify compliance with transport and disposal criteria; to obtain information on waste constituents to support proper packaging, labeling, and storage; and to support development of treatment and disposal plans for waste that cannot be certified. The proposed WCF would be constructed at the Radioactive Waste Management Complex (RWMC). In accordance with the Council on Environmental Quality (CEQ) requirements in 40 CFR Parts 1500-1508, the EA examined the potential environmental impacts of the proposed WCF and discussed potential alternatives. Based on the analyses in the EA, DOE has determined that the proposed action does not constitute a major Federal action significantly affecting the quality of the human environment within the meaning of the National Environmental Policy Act (NEPA) of 1969, and CEQ regulations at 40 CFR 1508.18 and 1508.27. Therefore, an Environmental Impact Statement is not required, and DOE is issuing this Finding of No Significant Impact.

14967 (DOE/EA–0944) **222-S radioactive liquid waste line replacement and 219-S secondary containment upgrade, Hanford Site, Richland, Washington.** Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 80p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008190. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) is proposing to: (1) replace the 222-S Laboratory (222-S) radioactive liquid waste drain lines to the 219-S Waste Handling Facility (219-S); (2) upgrade 219-S by replacing or upgrading the waste storage tanks and providing secondary containment and seismic restraints to the concrete cells which house the tanks; and (3) replace the transfer lines from 219-S to the 241-SY Tank Farm. This environmental assessment (EA) has been prepared in compliance with the National Environmental Policy Act (NEPA) of 1969, as amended, the Council on Environmental Quality Regulations for Implementing the Procedural Provisions of NEPA (40 Code of Federal Regulations [CFR] 1500-1508), and the DOE Implementing Procedures for NEPA (10 CFR 1021). 222-S is used to perform analytical services

on radioactive samples in support of the Tank Waste Remediation System and Hanford Site environmental restoration programs. Activities conducted at 222-S include decontamination of analytical processing and support equipment and disposal of nonarchived radioactive samples. These activities generate low-level liquid mixed waste. The liquid mixed waste is drained through pipelines in the 222-S service tunnels and underground concrete encasements, to two of three tanks in 219-S, where it is accumulated. 219-S is a treatment, storage, and/or disposal (TSD) unit, and is therefore required to meet Washington Administrative Code (WAC) 173-303, Dangerous Waste Regulations, and the associated requirements for secondary containment and leak detection. The service tunnels are periodically inspected by workers and decontaminated as necessary to maintain as low as reasonably achievable (ALARA) radiation levels. Although no contamination is reaching the environment from the service tunnels, the risk of worker exposure is present and could increase. 222-S is expected to remain in use for at least the next 30 years to serve the Hanford Site environmental cleanup mission.

14968 (DOE/EW/00003–3) **Application of best available science to the regulatory process: The case of environmental regulations. Final technical report, February 1990–January 1993.** Moghissi, A.A. Maryland Univ., Baltimore, MD (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90EW00003. Order Number DE95009649. Source: OSTI; NTIS; GPO Dep.

The current grant was a continuation of a previous grant awarded to the Institute for Regulatory Science. In July 1989, the functions of the Institute were transferred to the University of Maryland and the studies started at the Institute were continued at the University. The current grant started February 1, 1990. The objective of the project was to assure that societal decisions are based on the best available science (BAS). Previously, it was demonstrated that there are four categories of scientific information. These are: (1) Personal opinions; (2) Gray literature; (3) Peer-reviewed information; (4) Consensus scientific information. Each one of them is discussed under specific headings.

14969 (DOE/LLW–195) **RCRA designation of discarded americium/beryllium sealed sources.** Kirner, N.P. (Ebasco Environmental, Idaho Falls, ID (United States)). Lockheed Idaho Technologies Co., Idaho Falls, ID (United States); Ebasco Environmental, Idaho Falls, ID (United States). Sep 1994. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95008619. Source: OSTI; NTIS; INIS; GPO Dep.

Many sealed sources containing americium and beryllium are used throughout construction, industry, and research, and will eventually require disposal. For planning purposes it is necessary to determine whether these sources, when disposed, constitute a mixed waste, i.e., a waste containing hazardous constituents regulated under the Resource Conservation and Recovery Act and radioactive constituents regulated under the Atomic Energy Act. Waste designation criteria contained in 40 CFR 261 are evaluated in detail in this report. It is determined that discarded americium/beryllium sealed sources do not contain any wastes listed in Subpart D of 40 CFR 261, nor do the discarded sources exhibit any hazardous characteristics. Therefore, it is concluded that discarded americium/beryllium sealed sources are not a mixed waste under regulations established by the US Environmental Protection Agency. Hazardous waste regulatory programs delegated to States, however, may have regulations that differ from those of the Federal government.

14970 (DOE/MC/30170–95/C0438) **Advanced technologies for decontamination and conversion of scrap metals.** Muth, T.R. (Manufacturing Sciences Corp., Oak Ridge, TN (United States)); Moore, J.; Olson, D.; Mishra, B. Manufacturing Sciences Corp., Oak Ridge, TN (United States). [1994]. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30170. (CONF-9411149–25: Opportunity 95: environmental technology through small business, Morgantown, WV (United States), 16-17 Nov 1994). Order Number DE95008947. Source: OSTI; NTIS; INIS; GPO Dep.

Recycle of radioactive scrap metals (RSM) from decommissioning of DOE uranium enrichment and nuclear weapons manufacturing facilities is mandatory to recapture the value of these metals and avoid the high cost of disposal by burial. The scrap metals conversion project detailed below focuses on the contaminated nickel associated with the gaseous diffusion plants. Stainless steel can be produced in MSC's vacuum induction melting process (VIM) to the S30400 specification using nickel as an alloy constituent. Further the case alloy can be rolled in MSC's rolling mill to the mechanical property specification for S30400 demonstrating the capability to manufacture the contaminated nickel into valuable end products at a facility licensed to handle radioactive materials. Bulk removal of Technetium from scrap nickel is theoretically possible in a reasonable length of time with the high calcium fluoride flux, however the need for the high temperature creates a practical problem due to flux volatility. Bulk decontamination is possible and perhaps more desirable if nickel is alloyed with copper to lower the melting point of the alloy allowing the use of the high calcium fluoride flux. Slag decontamination processes have been suggested which have been proven technically viable at the Colorado School of Mines.

14971 (DOE/NV/11432–T5) **A water infiltration model: Study of reusability in an environmental engineering problem.** Cawlfield, D.E. (Reynolds Electrical & Engineering Co., Inc., Las Vegas, NV (United States)); Lindstrom, F.T.; Miel, G.J. Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-94NV11432. Order Number DE95008140. Source: OSTI; NTIS; GPO Dep.

The paper describes a computer simulation, involving a site characterization for the storage of low-level radioactive waste at the Nevada Test Site, in order to highlight the reutilization in that project of skills and tools used in aerospace computing.

14972 (DOE/OR–03-1195-D2) **Design demonstrations for Category B tank systems piping at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Dec 1994. 391p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/ER–193-D2). Order Number DE95008964. Source: OSTI; NTIS; INIS; GPO Dep.

Demonstration of the design of the piping systems described in this report is stipulated by the Federal Facility Agreement (FFA) between the U.S. Environmental Protection Agency (EPA)-Region IV, the Tennessee Department of Environment and Conservation (TDEC), and the U.S. Department of Energy (DOE). This report provides a design demonstration of the secondary containment and ancillary equipment of 30 piping systems designated in the FFA as Category B (i.e., existing tank systems with secondary containment). Based on the findings of the Design Demonstrations for the Remaining 19 Category B Tank Systems, (DOE/OR/03-1150 & D2), three tank systems originally designated as Category B have been redesignated as Category C (i.e., existing tank systems without secondary containment). The design demonstrations were developed using information obtained from design drawings (as-built when available), construction specifications, and interviews with facility operators. Each design demonstration addresses system conformance to the requirements of the FFA (Appendix F, Section C). Deficiencies or restrictions regarding the ability to demonstrate that each of the containment systems conforms to FFA requirements are noted in the discussion of each piping system and presented in Table 2.0-1.

14973 (DOE/OSTI–3406-Suppl.4-Add.1) **Yucca Mountain Site Characterization Project Bibliography, January–June 1993. An update: Supplement 4, Addendum 1.** Stephan, P.M. (ed.). USDOE Office of Scientific and Technical Information, Oak Ridge, TN (United States). Jan 1995. 31p. Sponsored by USDOE, Washington, DC (United States). Order Number DE94014499. Source: OSTI; NTIS; INIS; GPO Dep.

Following a reorganization of the Office of Civilian Radioactive Waste Management in 1990, the Yucca Mountain Project was renamed Yucca Mountain Site Characterization Project. The title of this bibliography was also changed to Yucca Mountain Site Characterization Project Bibliography. Prior to August 5, 1988, this

project was called the Nevada Nuclear Waste Storage Investigations. This bibliography contains information on this ongoing project that was added to the Department of Energy's Energy Science and Technology Database from January 1, 1994 through June 30, 1994. The bibliography is categorized by principal project participating organization. Participant-sponsored subcontractor reports, papers,and articles are included in the sponsoring organization's list. Another section contains information about publications on the Energy Science and Technology Database that were not sponsored by the project but have some relevance to it.

14974 (DOE/RL–88-30-Rev.4-Vol.1) **Hanford Site waste management units report. Revision 4, Volume 1.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). [1995]. 723p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95009600. Source: OSTI; NTIS; INIS; GPO Dep.

The Hanford Site waste management units report (hereafter referred to simply as the "units report") was originated to provide information responsive to Section 3004(u) of the Hazardous and Solid Waste Amendments of 1984. The units report provides a comprehensive inventory of all types of waste management units at the Hanford Site, including a description of the units and the waste they contain. Waste management units in the report include: Resource Conservation and Recovery Act of 1976 (RCRA) disposal units; Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) disposal units; unplanned releases; inactive contaminated structures; RCRA treatment, storage, and disposal (TSD) units; and other storage areas. Because of the comprehensive nature of the units report, the list of units is more extensive than required by Section 3004(u) of Hazardous and Solid Waste Amendments of 1984. The information in this report is extracted from the Waste Information Data System (WIDS). The WIDS database provides additional information concerning the waste management units contained in this report and is maintained with current changes to these waste management units. This report is updated annually if determined necessary per the Hanford Federal Facility Agreement and Consent Order (commonly known as the Tri-Party Agreement).

14975 (DOE/RL–88-30-Rev.4-Vol.2) **Hanford Site waste management units report: Sample and data management. Revision 4, Volume 2.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Jan 1955. 562p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95009601. Source: OSTI; NTIS; GPO Dep.

The Hanford Site waste management units report (hereafter referred to simply as the "units report") was originated to provide information responsive to Section 3004(u) of the Hazardous and Solid Waste Amendments of 1984. The units report provides a comprehensive inventory of all types of waste management units at the Hanford Site, including a description of the units and the waste they contain. Waste management units in the report include: Resource Conservation and Recovery Act of 1976 (RCRA) disposal units; Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) disposal units; unplanned releases; inactive contaminated structures; RCRA treatment, storage, and disposal (TSD) units; and other storage areas. Because of the comprehensive nature of the units report, the list of units is more extensive than required by Section 3004(u) of Hazardous and Solid Waste Amendments of 1984. The information in this report is extracted from the Waste Information Data System (WIDS). The WIDS database provides additional information concerning the waste management units contained in this report and is maintained with current changes to these waste management units. This report is updated annually if determined necessary per the Hanford Federal Facility Agreement and Consent Order (commonly known as the Tri-Party Agreement).

14976 (DOE/RL–93-94-Rev.1) **Plan and schedule for disposition and regulatory compliance for miscellaneous streams. Revision 1.** Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 25p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009086. Source: OSTI; NTIS; INIS; GPO Dep.

On December 23, 1991, the U.S. Department of Energy, Richland Operations Office (RL) and the Washington State Department of Ecology (Ecology) agreed to adhere to the provisions of Department of Ecology Consent Order No. DE 91NM-177 (Consent Order). The Consent Order lists regulatory milestones for liquid effluent streams at the Hanford Site to comply with the permitting requirements of Washington Administrative Code (WAC) 173-216 (State Waste Discharge Permit Program) or WAC 173-218 (Washington Underground Injection Control Program) where applicable. Hanford Site liquid effluent streams discharging to the soil column have been categorized in the Consent Order as follows: Phase I Streams Phase II Streams Miscellaneous Streams. Phase I and Phase II Streams are addressed in two RL reports: "Plan and Schedule to Discontinue Disposal of Contaminated Liquids into the Soil Column at the Hanford Site" (DOE-RL 1987), and "Annual Status of the Report of the Plan and Schedule to Discontinue Disposal of Contaminated Liquids into the Soil Column at the Hanford Site". Miscellaneous Streams are those liquid effluent streams discharged to the ground that are not categorized as Phase I or Phase II Streams. Miscellaneous Streams discharging to the soil column at the Hanford Site are subject to the requirements of several milestones identified in the Consent Order. This document provides a plan and schedule for the disposition of Miscellaneous Streams. The disposition process for the Miscellaneous Streams is facilitated using a decision tree format. The decision tree and corresponding analysis for determining appropriate disposition of these streams is presented in this document.

14977 (DOE/RL–94-42-Draft-A) **100-BC-2 limited field investigation report.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Aug 1994. 162p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95009615. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the data collection and analysis activities conducted during the 100-BC-2 Operable Unit limited field investigation and presents the associated qualitative risk assessment. This report also provides recommendations on the continued candidacy for interim remedial measures (IRM) for the three high-priority waste sites and the 11 solid waste burial grounds in this operable unit. The 100-BC-2 Source Operable Unit consists of an area about 1.7 km^2 (0.6 mi^2) within the Hanford B/C Area; it contains waste sites associated with the original plant facilities constructed to support the operation of the C Reactor and liquid, sludge, and solid waste units.

14978 (DOE/RL–94-47-Rev.1) **Proposed plan for the Environmental Restoration Disposal Facility (ERDF) at the Hanford Site, Richland, Washington. Revision 1.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Oct 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95008220. Source: OSTI; NTIS; INIS; GPO Dep.

This plan proposes construction and operation of the Environmental Restoration Disposal Facility (ERDF) for disposing waste from cleanup of the Hanford Site. The ERDF is proposed to be a single-trench landfill, capable of receiving only Hanford cleanup waste. The landfill would be closed with a protective cap. The ERDF would include roads, vehicles, a decontamination facility, and other facilities to support waste disposal. The cleanup waste may include soil, nibble, or other materials contaminated with hazardous (chemical), low-level radioactive, or mixed (combined hazardous chemical and radioactive) wastes removed from the Hanford Site. This proposed action would initially authorize construction and operation of two landfill cells capable of receiving approximately 1 million cubic yards of cleanup waste removed from along the Columbia River on the Hanford Site.

14979 (DOE/RL–94-55-Rev.1) **Hanford analytical services quality assurance plan. Revision 1.** Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 142p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (PNL–9803-Rev.1). Order Number DE95009997. Source: OSTI; NTIS; INIS; GPO Dep.

This document, the Hanford Analytical Services Quality Assurance Plan (HASQAP), is issued by the U.S. Department of Energy,

Richland Operations Office (RL). The HASQAP establishes quality requirements in response to U.S. Department of Energy (DOE) Order 5700.6C, Quality Assurance (10 CFR 830.120, "Quality Assurance Requirements"). The HASQAP is designed to meet the needs of the RL for controlling the of analytical chemistry services provided by laboratory operations. The HASQAP is issued through the Analytical Services Branch of the Waste Management Division. The Analytical Services Branch is designated by the RL as having the responsibility for oversight management of laboratory operations under the Waste Management Division. The laboratories conduct sample analyses under several regulatory statutes, such as the Clean Air Act and the Clean Water Act. Sample analysis in support of the Hanford Federal Facility Agreement and Consent Order (Tri-Party Agreement) is a major role of the laboratory operations.

14980 (DOE/RL–94-131) **Letter report for skyshine abatement assessment.** Department of Energy, Richland, WA (United States). Richland Operations Office. Mar 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95009011. Source: OSTI; NTIS; INIS; GPO Dep.

The term "skyshine," as used in this report, refers to radiation that originates from the 1301-N/1 325-N Liquid Waste Disposal Facilities (LWDF) and reflects back to the surrounding 100 N Area. Skyshine was first observed in 1980 by 100 N Area operators who were able to correlate elevated radiation readings with the amount of water shielding over 1301-N (i.e., depth of water maintained over 1301-N). Since 1980, measures have been taken to hold the errant radiation in abeyance. The most prominent of those measures are the concrete panels that reside atop 1301-N and 1325-N. This letter report has been issued in support of the overall 100 N Area strategy to address whether the effects of skyshine adversely impact the public who may pass by 1301-N/1325-N in the course of traveling along the Columbia River, or who trespass on the southeastern bank. The most likely trespassers are those who may fish or camp on the 100 N Area shoreline. Although the public is legally prohibited from trespassing along the shoreline, it is possible for the public to gain access to the 100 N Area shoreline. It is legal for the public to boat along the 100 N Area shoreline. In response to this concern, Tri-Party Agreement (TPA) Milestone M-16-12 was established. This report addresses whether a pre-remedial action for abatement of skyshine from 1301-N/1325-N is necessary to protect the general public prior to implementing the 1301-N/1325-N Closure Plan/Corrective Measure Study. The term "pre-remedial action" is used in this report because remedial actions for final site closure will be addressed in the 1301-N/1325-N Closure Plan/Corrective Measure Study. Skyshine from 1301-N/1325-N may have an effect on 100 N Area workers; however, such exposures are being addressed in numerous other ways such as Hanford Site safety procedures, the 1301-N/1325-N Closure Plan/Corrective Measure Study, and the 100-NR-1-Closure Measure Study.

14981 (DOE/RL–95-23) **1994 tier two emergency and hazard chemical inventory.** Zaloudek, D.E. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 87p. Order Number DE95009087. Source: OSTI; NTIS; GPO Dep.

This document is the 1994 Tier Two Emergency and Hazardous Chemical Inventory, Emergency Planning and Community Right-to-Know Act, Section 312 was prepared by the US DOE. This program is designed to provide state and local officials and the public with specific information on hazardous chemicals present at a facility. The report contains the following sections: delegation of signature authority, tier two instructions, chemical index, tier two forms and site plans.

14982 (DOE/WIPP–93-025-Rev.1) **Carlsbad Area Office strategic plan, March 1995. Revision 1.** USDOE Carlsbad Area Office, NM (United States). Mar 1995. 36p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009650. Source: OSTI; NTIS; INIS; Copies of this document may be obtained by calling 1-800-336-WIPP (1-800-366-9477).; GPO Dep.

This edition of the Carlsbad Area Office Strategic Plan captures the US Department of Energy's (DOE's) new focus, and supersedes the edition issued previously (DOE, 1993a). This revision reflects: a revised strategy designed to demonstrate compliance with environmental regulations earlier than the previous course of action; and a focus on establishment of standardized transuranic waste characterization and acceptance criteria for disposal facilities.

14983 (DOE/YMSCO–002) **Applications of natural analogue studies to Yucca Mountain as a potential high level radioactive waste repository.** Science Applications International Corp., Las Vegas, NV (United States). Feb 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-87NV10576. Order Number DE95009812. Source: OSTI; NTIS; INIS; GPO Dep.

The 5-member group convened in Las Vegas, Nov. 11-13, 1991, to clarify the extent to which studies of natural analogues can assist the Yucca Mountain site characterization (SC) project. This document is to provide guidance and recommendations to DOE for the implementation of natural analogue studies in the SC program. Performance assessment, integrity of engineered barriers, and communication to the public and the scientific community are stressed. The reference design being developed by Babcock & Wilcox Fuel Company are reviewed. Guidelines for selecting natural analogues are given. Quality assurance is discussed. Recommendations are given for developing an effective natural analogue program within the SC program.

14984 (EGG-WM–10962) **Interim report: Waste management facilities cost information for mixed low-level waste.** Feizollahi, F.; Shropshire, D. Idaho National Engineering Lab., Idaho Falls, ID (United States). Mar 1994. 302p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95009458. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains preconceptual designs and planning level life-cycle cost estimates for treating alpha and nonalpha mixed low-level radioactive waste. This report contains information on twenty-seven treatment, storage, and disposal modules that can be integrated to develop total life cycle costs for various waste management options. A procedure to guide the US Department of Energy and its contractor personnel in the use of estimating data is also summarized in this report.

14985 (FEMP–2344) **What will we do with 104,000,000 cubic feet of Fernald waste?.** Motl, G.P. (Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project); Krieger, G.J.; Rast, D.M. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-941214–5: 16. US Department of Energy low-level radioactive waste management conference, Phoenix, AZ (United States), 13-15 Dec 1994). Order Number DE95009013. Source: OSTI; INIS; NTIS; GPO Dep.

The Fernald Site, a Department of Energy (DOE) uranium metal production facility that ceased production in 1989, is now being remediated by the DOE under terms of a Consent Agreement with the United States Environmental Protection Agency (USEPA) and a Consent Decree with the State of Ohio. It is estimated that the cleanup will generate 104,000,000 cubic feet of low-level radioactive waste including construction debris, pit sludge, radium residue and a huge volume of uranium contaminated soil. The waste handling strategy for this huge volume of waste includes minimizing remedial waste generation, recycling material when economically feasible, free-releasing clean material and volume reduction. It is anticipated that large scale radium residue vitrification and sludge drying equipment/facilities will be constructed onsite for waste treatment prior to off-site disposal. Fernald waste disposition will include both onsite disposal (if approved under CERCLA) and off-site disposal at both commercial and DOE waste disposal facilities. The waste disposition strategy selected reflects a diverse variety of technical, political, regulatory and economic factors. This presentation will describe the current views at Fernald on "what will we do with 104,000,000 cubic feet of Fernald waste."

14986 (FEMP–2356) **An integrated building demolition and waste planning model for the Fernald Site.** Hampshire, L.H. (FERMCO, Cincinnati, OH (United States)); Clark, T.R.; Frost,

M.L.; Reising, J.W. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–90: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95009014. Source: OSTI; NTIS; INIS; GPO Dep.

The Fernald DOE site will begin full-scale remediation of buildings under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) during the 1995 fiscal year pursuant to a signed Record of Decision. This effort is currently estimated to cost $350 million and span a minimum duration of 8 years, if funding is not a constraint. The identification of the most viable sequence and schedule for the effort involved the development of an integrated planning model and the commissioning of a sitewide planning team. The resulting work product represents the best combination of assumptions and calculations possible at this time and provides information necessary for compliance with the CERCLA Remedial Design documentation requirements for the over 230 component structures governed by the decision. Sequence and integrated schedule development for the decontamination and dismantlement (D&D) of Fernald structures has involved evaluation of current and future utilization of structures, availability of waste storage and staging space, the needs and impacts of other on-going Fernald projects, Resource Conservation and Recovery Act (RCRA) waste management and remediation projects, the layout of site utilities, site hydrology, and the potential sizing, location, and construction rates for an on-property disposal cell.

14987 (FEMP–2366) **Potential impacts of pending residual radioactivity rules.** Burns, D.D. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–92: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95009015. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this paper is to present an overview of pending rules governing residual radioactive release criteria and radioactive waste management, and the potential impact of these rules on the Fernald Scrap Metal program. More than 300,000 cubic meters of radioactively contaminated waste will be generated during the dismantlement of three complexes at the Fernald Site over the next year and a half. Under current regulations, as much as 70% (5,000 tons) of steel will be either recycled or re-used in controlled applications. Depending on regulatory developments, the ratios of recycling to burial will range from 100% burial to recycling more than 90% of the waste. The absence of federal rules and regulations for classification of permissible levels of residual radioactivity is one of the most troublesome issues in the nuclear industry. The issue is growing in importance with the approaching end of useful life for many nuclear power generating stations and the planned remediation of the DOE nuclear weapons complex. Federal regulators have been involved in the "Enhanced rulemaking" process for over two years. The DOE Fernald site offers a good opportunity for understanding the potential impacts of the pending residual radioactivity regulations due to the maturity of the planned D&D activities, aggressive recycling program, and simple nature of contamination. The Fernald experience may offer a point of departure for many facilities engaged in D&D and waste management.

14988 (FEMP–2370) **In situ construction of horizontal soil containment barrier at Fernald.** Ridenour, D. (FERMCO, Cincinnati, OH (United States). Fernald Environmental Management Project); Pettit, P.J.; Walker, J. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–96: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95009117. Source: OSTI; NTIS; INIS; GPO Dep.

An innovative method of placing soil barriers to contain vertical flow is being prepared for demonstration by the Fernald Environmental Restoration Management Corporation (FERMCO), working in conjunction with the Department of Energy Office of Technology Development (DOE/OTD) and two principle subcontractors. The method employs proven directional drilling techniques, jet grouting technology and unique placement tooling to form horizontal soil barriers in situ. This is done without disturbance to existing land disposed wastes. This paper is a summary report on the current state of that demonstration, including: a discussion of the construction methods, the results of the initial tool tests, an overview of the Fernald site conditions and, the resulting path of tooling development for the second phase of tool testing.

14989 (GSF–12/94) **The HAW project. Test storage of high-level radiation sources in the Asse salt mine. Documentation and assessment of the storage system.** Mueller, K.; Rothfuchs, T. GSF - Forschungszentrum fuer Umwelt und Gesundheit GmbH, Braunschweig (Germany). Inst. fuer Tieflagerung. 1994. 129p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany);Commission of the European Communities, Brussels (Belgium). Foerderkennzeichen BMFT KWA8507A; Foerderkennzeichen CEC FI2W-CT (GSF-TL–5/94). Order Number DE95769156. Source: OSTI; NTIS (US Sales Only); INIS.

The HAW project aimed primarily at studying the interaction between high-level radioactive waste moulds and rock salt as the respository medium. Another priority was the prototype development and testing of a technical system for the emplacement of high-level radioactive moulds in deep storage boreholes. To simulate real high-level radioactive wastes, special high-level radiation sources (Cs-137, Sr-90) were produced in the United States of America under a German-American cooperation contract, for carrying out the tests at the Asse salt mine. The components of the storage system are described, their position and task within the entire handling procedure explained. Questions of radiation protection and accident protection, of functioning and operating reliability, of quality assurance and examination of documents, materials, of manufacture and functioning, and of documentation are dealt with in detail. With a view to the planning of storage techniques for a mine respository, the experience of development and operation is recorded, and recommendation of further developments are given. Problems which arose during work on the HAW project were partly due to test-specific reasons and will not or not in this form occur in a mine respository. It was planned to start the test emplacement in 1987, and it could have been executed in 1993 after appropriate preparation and approval of the storage system by the mining authority and the Hanover TUEV in 1991. In December 1992, however, the Federal Government decided to give up to the project due to the uncertain licensing situation, and to immediately stop all preparatory work. (orig./HP)

14990 (IAEA-TECDOC–775) **Handling, treatment, conditioning and storage of biological radioactive wastes. Technical manual for the management of low and intermediate level wastes generated at small nuclear research centres and by radioisotope users in medicine, research and industry.** International Atomic Energy Agency, Vienna (Austria). Dec 1994. 48p. Order Number DE95627044. Source: OSTI; NTIS (US Sales Only); INIS.

Biological materials that contain radioactive isotopes have many important applications. During the production and use of these materials, waste will inevitably arise which must be managed with particular care due to their potential biological as well as radiological hazards. This report deals with wastes that arise outside the nuclear fuel cycle and is directed primarily to countries without nuclear power programmes. It is intended to provide guidance to Member States in the handling, treatment and conditioning of biological radioactive materials. The objective of radioactive waste management is to handle, pretreat, treat, condition, store, transport and dispose of radioactive waste in a manner that protects human health and the environment without imposing undue burdens on future generations. 31 refs, 15 figs, 3 tabs.

14991 (IAEA-TECDOC–776) **Reference design for a centralized waste processing and storage facility. Technical manual for the management of low and intermediate level wastes generated at small nuclear research centres and by radioisotope users in medicine, research and industry.** International Atomic

Energy Agency, Vienna (Austria). Dec 1994. 108p. Order Number DE95627045. Source: OSTI; NTIS (US Sales Only); INIS.

The objective of this report is to present the generic reference design of a centralized waste processing and storage facility (WPSF) intended for countries producing small but significant quantities of liquid and solid radioactive wastes. These wastes are generated through the use of radionuclides for research, medical, industrial and other institutional activities in IAEA Member States that have not yet developed the infrastructure for a complete nuclear fuel cycle. The WPSF comprises two separate buildings. The first, for receiving and processing waste from the producers, includes the necessary equipment and support services for treating and conditioning the waste. The second building acts as a simple but adequate warehouse for storing a ten year inventory of the conditioned waste. In developing the design, it was a requirement of the IAEA that options for waste management techniques for each of the waste streams should be evaluated, in order to demonstrate that the reference design is based on the most appropriate technology. Refs, figs and tabs.

14992 (IAEA-TECDOC–789) **Preparation of safety analysis reports (SARs) for near surface radioactive waste disposal facilities. Format and content of SARs.** International Atomic Energy Agency, Vienna (Austria). Feb 1995. 23p. Order Number DE95628050. Source: OSTI; NTIS (US Sales Only); INIS.

All facilities at which radioactive wastes are processed, stored and disposed of have the potential for causing hazards to humans and to the environment. Precautions must be taken in the siting, design and operation of the facilities to ensure that an adequate level of safety is achieved. The processes by which this is evaluated is called safety assessment. An important part of safety assessment is the documentation of the process. A well prepared safety analysis report (SAR) is essential if approval of the facility is to be obtained from the regulatory authorities. This TECDOC describes the format and content of a safety analysis report for a near surface radioactive waste disposal facility and will serve essentially as a checklist in this respect.

14993 (INEL–94/00052) **Case study and presentation of the DOE treatability group concept for low-level and mixed waste streams.** Kirkpatrick, T.D. (Lockheed Idaho Technologies, Germantown, MD (United States)); Heath, B.A.; Davis, K.D. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-941214–6: 16. US Department of Energy low-level radioactive waste management conference, Phoenix, AZ (United States), 13-15 Dec 1994). Order Number DE95008616. Source: OSTI; NTIS; INIS; GPO Dep.

The Federal Facility Compliance Act of 1992 requires the US Department of Energy (DOE) to prepare an inventory report of its mixed waste and treatment capacities and technologies. Grouping waste streams according to technological requirements is the logical means of matching waste streams to treatment technologies, and streamlines the effort of identifying technology development needs. To provide consistency, DOE has developed a standard methodology for categorizing waste into treatability groups based on three characteristic parameters: radiological, bulk physical/chemical form, and regulated contaminant. Based on category and component definitions in the methodology, descriptive codes or strings of codes are assigned under each parameter, resulting in a waste characterization amenable to a computerized format for query and sort functions. By using only the applicable parameters, this methodology can be applied to all waste types generated within the DOE complex: radioactive, hazardous, mixed, and sanitary/municipal. Implementation of this methodology will assist the individual sites and DOE Headquarters in analyzing waste management technology and facility needs.

14994 (IS–5111) **Analysis of waste-vitrification process samples: Improvements in sample preparation and analysis methods.** Baldwin, D.P.; Zamzow, D.S.; D'Silva, A.P. Ames Lab., IA (United States). 30 Jun 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE95010235. Source: OSTI; NTIS; INIS; GPO Dep.

Radwaste vitrification at West Valley requires timely chemical analysis of glass-former materials, waste from the tanks, mixed precursors in slurry form prior to melting, and shards of the final glass. Since the final glass quality depends on the slurry composition, the slurry analyses must be performed as quickly as possible. Feasibility of alternative analytical methods for the slurry was studied, including rapid dissolution methods combined with direct and pneumatic nebulization of the samples and analysis by inductively coupled plasma atomic emission spectrometry (ICPAES), as well as some laser ablation-ICPAES methods. All methods were evaluated in terms of speed, accuracy, and precision, and applicability in a hot cell or glove box. The digestion procedure and analytical line selection are covered in an appendix.

14995 (KCP–613-5532) **Opportunity assessments: A tool for waste minimization and pollution prevention.** Pemberton, S.E.; Schlosberg, W.H. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Mar 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. (CONF-950216–93: Waste management '95; ECM '95 conference, Tucson, AZ (United States); Las Cruces, NM (United States), 26 Feb - 2 mar 1995; 12-15 mar 1995; CONF-9503119–1). Order Number DE95008949. Source: OSTI; NTIS; GPO Dep.

Waste costs, liabilities, and regulations continue to be growing concerns for government and industry. Pollution prevention opportunity assessments (PPOAs) are a tool which proactively manages these concerns. The Department of Energy (DOE) has recognized the benefits of PPOAs in the DOE Waste Minimization Pollution Prevention Crosscut Plan which states that the completion of opportunity assessments is of critical importance to DOE because they are an essential management decision-making tool that tell DOE: (1) how much waste and environmental releases can be avoided; (2) through what activity/process changes waste reduction can be achieved; (3) what it will cost to implement a pollution prevention opportunity; and (4) what will be the long-term savings in avoided waste management costs. Before exploring what a PPOA is, a brief discussion of pollution prevention is necessary. Pollution prevention (P2) may also be referred to as waste minimization, source reduction, and/or recycling. The definition used in the DOE-sponsored PPOA training class is: "Pollution prevention reduces or eliminates material releases to air, water, and/or land." The benefits of pollution prevention include a proactive approach to waste management, compliance issues, and liability concerns; economic incentives; improved employee and public health; and environmental stewardship. Basically it all boils down to the phrase, "It's the right thing to do."

14996 (KFK–5384) **Transmutation of long-lived minor actinides and fission products by accelerated protons.** Segev, M. (Kernforschungszentrum Karlsruhe GmbH (Germany)); Kuesters, H.; Pelloni, S. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Dec 1994. 55p. Order Number DE95769845. Source: OSTI; NTIS (US Sales Only); INIS.

In this report a methodology is developed to describe theoretically the transmutation of minor actinides (MA) with the help of an accelerator driven subcritical fuel region with high energetic protons of 1.6 GeV and a current of about 100 mA. This methodology is applied to a PHOENIX-type arrangement of fuel containing minor actinides as Am, Np and also long-lived fission products as ^{129}I and ^{99}Tc. It is shown that the MA are burnt effectively in such an arrgangement. A balance of the needed energy is made including the energy, given to the net. (orig.)

14997 (KTM/E-B–184) **Publicly administrated nuclear waste management research programme 1994-1996. General plan for the research programme and research plan for 1994.** Ministry of Trade and Industry, Helsinki (Finland). Energy Dept. 1994. 46p. Order Number DE95628824. Source: OSTI; NTIS; INIS.

The nuclear energy legislation of Finland includes detailed stipulations concerning nuclear waste management. Each producer of nuclear waste is responsible for the safe handling, management and disposal of the waste, and for the financing of these operations. The authorities supervise and control the implementation of the national waste management programme and set the necessary safety and other requirements. The principal goal of the JYT programme is to provide the authorities with information and research

results relevant for the safety of nuclear waste management in order to support the various activities of the authorities. The whole field of the research programme is subdivided into the following main topic areas: (1) bedrock structure and stability, rock investigation methods, and characteristics and flow of groundwater, (2) release of radionuclides from a repository and subsequent migration in the bedrock, (3) performance and safety assessment of repositories and other phases of nuclear waste management (4) natural analogue studies, (5) waste management technology and costs and (6) sociopolitical and other societal issues and environmental impact assessment.

14998 (LA–12908-MS) **Status of volcanism studies for the Yucca Mountain Site Characterization Project.** Crowe, B. (Los Alamos National Lab., NM (United States)); Perry, F.; Murrell, M.; Poths, J.; Valentine, G.A.; Wells, S.; Bowker, L.; Finnegan, K.; Geissman, J.; McFadden, L. Los Alamos National Lab., NM (United States). Feb 1995. 396p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009090. Source: OSTI; NTIS; INIS; GPO Dep.

Chapter 1 introduces the volcanism issue for the Yucca Mountain site and provides the reader with an overview of the organization, content, and significant conclusions of this report. The risk of future basaltic volcanism is the primary topic of concern including both events that intersect a potential repository and events that occur near or within the waste isolation system of a repository. Chapter 2 describes the volcanic history of the Yucca Mountain region (YMR) and emphasizes the Pliocene and Quaternary volcanic record, the interval of primary concern for volcanic risk assessment. The Lathrop Wells volcanic center is described in detail because it is the youngest basalt center in the YMR. Chapter 3 describes the tectonic setting of the YMR and presents and assesses the significance of multiple alternative tectonic models. Geophysical data are described for the YMR and are used as an aid to understand the distribution of basaltic volcanic centers. Chapter 4 discusses the petrologic and geochemical features of basaltic volcanism in the YMR, the southern Great Basin and the Basin and Range province. The long time of activity and characteristic small volume of the Postcaldera basalt of the YMR result in one of the lowest eruptive rates in a volcanic field in the southwest United States. Chapter 5 summarizes current concepts of the segregation, ascent, and eruption of basalt magma. Chapter 6 summarizes the history of volcanism studies (1979 through early 1994), including work for the Yucca Mountain Site Characterization Project and overview studies by the state of Nevada and the Nuclear Regulatory Commission. Chapter 7 summarizes probabilistic volcanic hazard assessment using a three-part conditional probability model. Chapter 8 describes remaining volcanism work judged to be needed to complete characterization studies for the YMR. Chapter 9 summarizes the conclusions of this volcanism status report.

14999 (LA-SUB–95-42) **ABC Technology Development Program.** Los Alamos National Lab., NM (United States). 14 Oct 1994. 108p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009040. Source: OSTI; NTIS; INIS; GPO Dep.

The Accelerator-Based Conversion (ABC) facility will be designed to accomplish the following mission: 'Provide a weapon's grade plutonium disposition capability in a safe, economical, and environmentally sound manner on a prudent schedule for [50] tons of weapon's grade plutonium to be disposed on in [20] years.' This mission is supported by four major objectives: provide a reliable plutonium disposition capability within the next [15] years; provide a level of safety and of safety assurance that meets or exceeds that afforded to the public by modern commercial nuclear power plants; meet or exceed all applicable federal, state, and local regulations or standards for environmental compliance; manage the program in a cost effective manner. The ABC Technology Development Program defines the technology development activities that are required to accomplish this mission. The technology development tasks are related to the following topics: blanket system; vessel systems; reactivity control systems; heat transport system components; energy conversion systems; shutdown heat transport systems components; auxiliary systems; technology demonstrations - large scale experiments.

15000 (LA-UR–94-2018) **Waste gas combustion in a Hanford radioactive waste tank.** Travis, J.R.; Fujita, R.K.; Spore, J.W. Los Alamos National Lab., NM (United States). [1994]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-941102–3: Winter meeting of the American Nuclear Society, Washington, DC (United States), 13-18 Nov 1994). Order Number DE94014290. Source: OSTI; NTIS; INIS; GPO Dep.

It has been observed that a high-level radioactive waste tank generates quantities of hydrogen, ammonia, nitrous oxide, and nitrogen that are potentially well within flammability limits. These gases are produced from chemical and nuclear decay reactions in a slurry of radioactive waste materials. Significant amounts of combustible and reactant gases accumulate in the waste over a 110- to 120-d period. The slurry becomes Taylor unstable owing to the buoyancy of the gases trapped in a matrix of sodium nitrate and nitrite salts. As the contents of the tank roll over, the generated waste gases rupture through the waste material surface, allowing the gases to be transported and mixed with air in the cover-gas space in the dome of the tank. An ignition source is postulated in the dome space where the waste gases combust in the presence of air resulting in pressure and temperature loadings on the double-walled waste tank. This analysis is conducted with hydrogen mixing studies HMS, a three-dimensional, time-dependent fluid dynamics code coupled with finite-rate chemical kinetics. The waste tank has a ventilation system designed to maintain a slight negative gage pressure during normal operation. We modeled the ventilation system with the transient reactor analysis code (TRAC), and we coupled these two best-estimate accident analysis computer codes to model the ventilation system response to pressures and temperatures generated by the hydrogen and ammonia combustion.

15001 (LA-UR–95-90) **Characterization of low level mixed waste at Los Alamos National Laboratory.** Hepworth, E. (Santa Fe Engineering, Ltd. (United States)); Montoya, A.; Holizer, B. Los Alamos National Lab., NM (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9503102–2: Waste management symposia, Tucson, AZ (United States), 1 Mar 1995). Order Number DE95006334. Source: OSTI; NTIS; INIS; GPO Dep.

The characterization program was conducted to maintain regulatory compliance and support ongoing waste treatment and disposal activities. The characterization team conducted a characterization review of wastes stored at the Laboratory that contain both a low-level radioactive and a hazardous component. The team addressed only those wastes generated before January 1993. The wastes reviewed, referred to as legacy wastes, had been generated before the implementation of comprehensive waste acceptance documentation procedures. The review was performed to verify existing RCRA code assignments and was required as part of the Federal Facility Compliance Agreement (FFCA). The review entailed identifying all legacy LLMW items in storage, collecting existing documentation, contacting and interviewing generators, and reviewing code assignments based upon information from knowledge of process (KOP) as allowed by RCRA. The team identified 7,546 legacy waste items in the current inventory, and determined that 4,200 required further RCRA characterization and documentation. KOP characterization was successful for accurately assigning RCRA codes for all but 117 of the 4,200 items within the scope of work. As a result of KOP interviews, 714 waste items were determined to be non-hazardous, while 276 were determined to be non-radioactive. Other wastes were stored as suspect radioactive. Many of the suspect radioactive wastes were certified by the generators as non-radioactive and will eventually be removed.

15002 (LA-UR–95-113) **Potential chemical hazards during retrieval of TRU waste drums.** Kosiewicz, S.T.; Thomas, C.C. Jr.; Sasser, M.K.; Foxx, C.L.; Gruetzmacher, K.M. Los Alamos National Lab., NM (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950601–5: Annual meeting of the American Nuclear Society, Philadelphia, PA (United States), 25-29 Jun 1995). Order Number DE95006296. Source: OSTI; NTIS; INIS; GPO Dep.

Los Alamos National Laboratory is implementing a program to retrieve a large number of transuranic (TRU) waste containers retrievably stored under earthen cover on three pads. The waste containers will be inspected and overpacked or repackaged as necessary. The majority of the containers are drums (> 16,000) and, as shown in Table 1,99.9% are 208-L (55-gal.) drums. The 208-L drums are reported to be of mild steel construction with removable lids and gaskets. The gaskets are believed to be permeable to hydrogen, but their permeability to volatile organic compounds (VOCS) is not known. As part of the retrieval operations, the drums will be penetrated and then fitted with a carbon-filter-containing venting device to ensure they do not contain flammable gases. A fully contained and high-efficiency air particulate (HEPA) filtered venting system with gas analysis capability for insertion of the vent device has been designed and is being constructed. A Hazards Analysis (HA) has been performed on the system to identify and evaluate potential accidents arising from the operation of the drum venting system.

15003 (LA-UR–95-213) **The physics design of accelerator-driven transmutation systems.** Venneri, F. Los Alamos National Lab., NM (United States). [1995]. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950777–1: Accelerator-driven transmutation technology (ADTT) conference, Las Vegas, NV (United States), 24-29 Jul 1995). Order Number DE95006293. Source: OSTI; NTIS; INIS; GPO Dep.

Nuclear systems under study in the Los Alamos Accelerator-Driven Transmutation Technology program (ADTT) will allow the destruction of nuclear spent fuel and weapons-return plutonium, as well as the production of nuclear energy from the thorium cycle, without a long-lived radioactive waste stream. The subcritical systems proposed represent a radical departure from traditional nuclear concepts (reactors), yet the actual implementation of ADTT systems is based on modest extrapolations of existing technology. These systems strive to keep the best that the nuclear technology has developed over the years, within a sensible conservative design envelope and eventually manage to offer a safer, less expensive and more environmentally sound approach to nuclear power.

15004 (LA-UR–95-817) **Introduction to spallation physics and spallation-target design.** Russell, G.J.; Pitcher, E.J.; Daemen, L.L. Los Alamos National Lab., NM (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950777–2: Accelerator-driven transmutation technology (ADTT) conference, Las Vegas, NV (United States), 24-29 Jul 1995). Order Number DE95007840. Source: OSTI; NTIS; INIS; GPO Dep.

When coupled with the spallation process in appropriate target materials, high-power accelerators can be used to produce large numbers of neutrons, thus providing an alternate method to the use of nuclear reactors for this purpose. Spallation offers exciting new possibilities for generating intense neutron fluxes for a variety of applications, including: (a) spallation-neutron sources for materials science research; (b) accelerator-based production of tritium; (c) accelerator-based transmutation of waste; (d) accelerator-based destruction of plutonium; and (e) radioisotope production for medical and energy applications. Target design plays a key role in these applications, with neutron production/leakage being strongly dependent on the incident particle type and energy, and target material and geometry.

15005 (LA-UR–95-1096) **Accelerator-based conversion (ABC) of weapons plutonium: Plant layout study and related design issues.** Cowell, B.S. (Oak Ridge National Lab., TN (United States)); Fontana, M.H.; Krakowski, R.A.; Beard, C.A.; Buksa, J.J.; Davidson, J.W.; Sailor, W.C.; Williamson, M.A. Los Alamos National Lab., NM (United States). [1995]. 152p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009491. Source: OSTI; NTIS; INIS; GPO Dep.

In preparation for and in support of a detailed R and D Plan for the Accelerator-Based Conversion (ABC) of weapons plutonium, an ABC Plant Layout Study was conducted at the level of a pre-conceptual engineering design. The plant layout is based on an adaptation of the Molten-Salt Breeder Reactor (MSBR) detailed conceptual design that was completed in the early 1070s. Although the ABC Plant Layout Study included the Accelerator Equipment as an essential element, the engineering assessment focused primarily on the Target; Primary System (blanket and all systems containing plutonium-bearing fuel salt); the Heat-Removal System (secondary-coolant-salt and supercritical-steam systems); Chemical Processing; Operation and Maintenance; Containment and Safety; and Instrumentation and Control systems. Although constrained primarily to a reflection of an accelerator-driven (subcritical) variant of MSBR system, unique features and added flexibilities of the ABC suggest improved or alternative approaches to each of the above-listed subsystems; these, along with the key technical issues in need of resolution through a detailed R&D plan for ABC are described on the bases of the "strawman" or "point-of-departure" plant layout that resulted from this study.

15006 (LBL-PUB–5254(1994)) **Radioactive and mixed waste management plan for the Lawrence Berkeley Laboratory Hazardous Waste Handling Facility.** Lawrence Berkeley Lab., CA (United States). Jan 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95006594. Source: OSTI; NTIS; INIS; GPO Dep.

This Radioactive and Mixed Waste Management Plan for the Hazardous Waste Handling Facility at Lawrence Berkeley Laboratory is written to meet the requirements for an annual report of radioactive and mixed waste management activities outlined in DOE Order 5820.2A. Radioactive and mixed waste management activities during FY 1994 listed here include principal regulatory and environmental issues and the degree to which planned activities were accomplished.

15007 (NUREG/CR–4918-Vol.8) **Control of water infiltration into near surface LLW disposal units. Progress report on field experiments at a humid region site, Beltsville, Maryland: Volume 8.** Schulz, R.K. (California Univ., Los Angeles, CA (United States)); Ridky, R.W.; O'Donnell, E. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications; California Univ., Los Angeles, CA (United States); Maryland Univ., College Park, MD (United States). Dept. of Geology. Apr 1995. 21p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This study's objective is to assess means for controlling water infiltration through waste disposal unit covers in humid regions. Experimental work is being performed in large-scale lysimeters 21.34 m x 13.72 m x 3.05 m (75 ft x 45 ft x 10 ft) at Beltsville, Maryland. Results of the assessment are applicable to disposal of low-level radioactive waste (LLW), uranium mill tailings, hazardous waste, and sanitary landfills. Three kinds of waste disposal unit covers or barriers to water infiltration are being investigated: (1) resistive layer barrier, (2) conductive layer barrier, and (3) bioengineering management. The resistive layer barrier consists of compacted earthen material (e.g., clay). The conductive layer barrier consists of a conductive layer in conjunction with a capillary break. As long as unsaturated flow conditions are maintained, the conductive layer will wick water around the capillary break. Below-grade layered covers such as (1) and (2) will fail if there is appreciable subsidence of the cover, and remedial action for this kind of failure will be difficult. A surface cover, called bioengineering management, is meant to overcome this problem. The bioengineering management surface barrier is easily repairable if damaged by subsidence; therefore, it could be the system of choice under active subsidence conditions. The bioengineering management procedure also has been shown to be effective in dewatering saturated trenches and could be used for remedial action efforts. After cessation of subsidence, that procedure could be replaced by a resistive layer barrier or, perhaps even better, by a resistive layer barrier/conductive layer barrier system. The latter system would then give long-term effective protection against water entry into waste without institutional care.

15008 (NUREG/CR–6283) **Field site investigation: Effect of mine seismicity on groundwater hydrology.** Ofoegbu, G.I. (Southwest Research Inst., San Antonio, TX (United States). Center for Nuclear Waste Regulatory Analyses); Hsiung, S.; Chowdhury, A.H.; Philip, J. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Regulatory Applications;

Southwest Research Inst., San Antonio, TX (United States). Center for Nuclear Waste Regulatory Analyses. Apr 1995. 101p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). (CNWRA–94-017). Source: OSTI; NTIS; GPO; INIS.

The results of a field investigation on the groundwater-hydrologic effect of mining-induced earthquakes are presented in this report. The investigation was conducted at the Lucky Friday Mine, a silver-lead-zinc mine in the Coeur d'Alene Mining District of Idaho. The groundwater pressure in sections of three fracture zones beneath the water table was monitored over a 24-mo period. The fracture zones were accessed through a 360-m-long inclined borehole, drilled from the 5,700 level station of the mine. The magnitude, source location, and associated ground motions of mining-induced seismic events were also monitored during the same period, using an existing seismic instrumentation network for the mine, augmented with additional instruments installed specifically for the project by the center for Nuclear Waste Regulatory Analyses (CNWRA). More than 50 seismic events of Richter magnitude 1.0 or larger occurred during the monitoring period. Several of these events caused the groundwater pressure to increase, whereas a few caused it to decrease. Generally, the groundwater pressure increased as the magnitude of seismic event increased; for an event of a given magnitude, the groundwater pressure increased by a smaller amount as the distance of the observation point from the source of the event increased. The data was examined using regression analysis. Based on these results, it is suggested that the effect of earthquakes on groundwater flow may be better understood through mechanistic modeling. The mechanical processes and material behavior that would need to be incorporated in such a model are examined. They include a description of the effect of stress change on the permeability and water storage capacity of a fracture rock mass; transient fluid flow; and the generation and transmission of seismic waves through the rock mass.

15009 (ORNL/ER–280) **Annual summary report of the Decontamination and Decommissioning Surveillance and Maintenance Program at Oak Ridge National Laboratory for period ending September 30, 1994.** Anderson, L.A. (comp.); Burwinkle, T.W.; Ford, M.K.; Gaddis, H.R.; Holder, L. Jr.; Mandry, G.J.; Nelson, T.R.; Patton, B.D. Oak Ridge National Lab., TN (United States). Mar 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009999. Source: OSTI; NTIS; INIS; GPO Dep.

The Surplus Facilities Management Program (SFMP) was established at Oak Ridge National Laboratory (ORNL) in 1976 to provide collective management of all surplus sites under ORNL's control on the Oak Ridge Reservation. Presently, over 50 facilities, grouped into projects, are currently managed by the Decontamination and Decommissioning Program, the successor program to the SFMP. Support includes (1) surveillance and maintenance planning; (2) routine surveillance and maintenance; and (3) special maintenance projects. This report documents routine surveillance and maintenance, special projects, and special maintenance performed on these facilities for the period of October 1993 through September 1994.

15010 (ORNL/ER–290) **Wet season reconnaissance report on Seeps and Springs in Waste Area Grouping 6 at Oak Ridge National Laboratory. Environmental Restoration Program.** Oak Ridge National Lab., TN (United States); Science Applications International Corp., Oak Ridge, TN (United States). Feb 1995. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95010053. Source: OSTI; NTIS; GPO Dep.

As part of the Environmental Monitoring Plan for Waste Area Grouping 6 at Oak Ridge National Laboratory, Oak Ridge, Tennessee (DOE, 1993), seep and spring identification at WAG 6 is required. The Environmental Monitoring Plan requires the determination and monitoring of contaminant flux into and out of WAG 6. Part of the monitoring is accomplished through surface water monitoring stations and groundwater monitoring wells; however, these monitoring locations do not completely monitor all areas in WAG 6. Seeps and springs are known to exist within and around WAG 6. These seeps and springs can be used to provide; (1) additional monitoring data for near surface water/groundwater monitoring locations and (2) monitoring data for seep/spring locations where surface water/groundwater monitoring is not feasible. The identification and location of seeps and springs in and around the WAG 6 area were required to provide these data points. The location and identification of seeps and springs is referred to as a seep and spring reconnaissance. The reconnaissance for the WAG 6 area was conducted in accordance with Seep and Spring Reconnaissance Plan for Waste Area Grouping 6, (ECE, 1993). The plan required two reconnaissance efforts in order to compare and contrast seasonal effects on the seeps and springs. Both a dry season (August through October) and a wet season (November through mid-April) reconnaissance were performed. The plan required the identification of seep/spring locations under antecedent conditions of less than 0.1 inch of rainfall in the preceding 72 hours. The reconnaissance plan required that groundwater discharge (seeps and springs) locations be: visually identified, photographed, marked and numbered, and described. In addition, surface radiologic, volatile organic chemical measurements and estimated flow rate measurements were determined at each identified seep.

15011 (ORNL/TM–12900) **Contaminated nickel scrap processing.** Compere, A.L.; Griffith, W.L.; Hayden, H.W.; Johnson, J.S. Jr.; Wilson, D.F. Oak Ridge National Lab., TN (United States). Dec 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009063. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE will soon choose between treating contaminated nickel scrap as a legacy waste and developing high-volume nickel decontamination processes. In addition to reducing the volume of legacy wastes, a decontamination process could make 200,000 tons of this strategic metal available for domestic use. Contaminants in DOE nickel scrap include ^{234}Th, ^{234}Pa, ^{137}Cs, ^{239}Pu (trace), ^{60}Co, U, ^{99}Tc, and ^{237}Np (trace). This report reviews several industrial-scale processes – electrorefining, electrowinning, vapormetallurgy, and leaching – used for the purification of nickel. Conventional nickel electrolysis processes are particularly attractive because they use side-stream purification of process solutions to improve the purity of nickel metal. Additionally, nickel purification by electrolysis is effective in a variety of electrolyte systems, including sulfate, chloride, and nitrate. Conventional electrorefining processes typically use a mixed electrolyte which includes sulfate, chloride, and borate. The use of an electrorefining or electrowinning system for scrap nickel recovery could be combined effectively with a variety of processes, including cementation, solvent extraction, ion exchange, complex-formation, and surface sorption, developed for uranium and transuranic purification. Selected processes were reviewed and evaluated for use in nickel side-stream purification. 80 refs.

15012 (ORNL/TM–12908) **Analysis of source term modeling for low-level radioactive waste performance assessments.** Icenhour, A.S. Oak Ridge National Lab., TN (United States). Mar 1995. 137p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009657. Source: OSTI; NTIS; INIS; GPO Dep.

Site-specific radiological performance assessments are required for the disposal of low-level radioactive waste (LLW) at both commercial and US Department of Energy facilities. This work explores source term modeling of LLW disposal facilities by using two state-of-the-art computer codes, SOURCE1 and SOURCE2. An overview of the performance assessment methodology is presented, and the basic processes modeled in the SOURCE1 and SOURCE2 codes are described. Comparisons are made between the two advective models for a variety of radionuclides, transport parameters, and waste-disposal technologies. These comparisons show that, in general, the zero-order model predicts undecayed cumulative fractions leached that are slightly greater than or equal to those of the first-order model. For long-lived radionuclides, results from the two models eventually reach the same value. By contrast, for short-lived radionuclides, the zero-order model predicts a slightly higher undecayed cumulative fraction leached than does the first-order model. A new methodology, based on sensitivity and uncertainty analyses, is developed for predicting intruder scenarios. This method is demonstrated for ^{137}Cs in a tumulus-type disposal

facility. The sensitivity and uncertainty analyses incorporate input-parameter uncertainty into the evaluation of a potential time of intrusion and the remaining radionuclide inventory. Finally, conclusions from this study are presented, and recommendations for continuing work are made.

15013 (ORNL/TM–12910) **Mercury removal from aqueous mixed waste.** Klasson, K.T.; Perona, J.J.; Corder, S.L. Oak Ridge National Lab., TN (United States). Mar 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009926. Source: OSTI; NTIS; GPO Dep.

Large volumes of mercury-contaminated wastes are stored on U.S. Department of Energy (DOE) I sites. The mixed wastes contain sufficient radioactivity and hazardous materials that they must be handled under both the Atomic Energy Act and the Resource Conservation and Recovery Act. New, inexpensive, and improved separation methods are needed for treating a wide variety of mixed wastes at many DOE facilities. Volatile mercury should be removed from aqueous wastes before potential water evaporation and thermal treatment. For some solids, innovative methods such as selective leaching are being developed and there is a need for secondary treatment or regeneration of the leachate liquids. Laboratory work was performed in order to investigate the possibility of using inexpensive sulfur-impregnated, activated-carbon pellets (Mersorb®) to remove mercury from aqueous waste. The desired goal was to generate engineering-scale data so that the mercury could be separated (removed) from aqueous streams or reliably accounted for in the development of overall treatment strategies for mixed wastes. Laboratory studies demonstrated that mercury could be removed to levels below the current Environmental Protection Agency toxic characteristic level (0.2 ppm) when Mersorb was used under a variety of operating conditions. When comparing the use of the inexpensive Mersorb with the more expensive ion exchanger, Duolite GT-73, the Mersorb had favorable process economics; however, further testing and economic analysis is required before making final conclusions. The target wastes were selected by obtaining mixed waste inventories for several DOE sites, evaluating the wastes against a set of seven criteria, and by contacting Mixed Waste Integrated Program representatives at the sites to discuss tentative target wastes.

15014 Storage of nuclear materials by encapsulation in fullerenes. Coppa, N.V. To Dept. of Energy. 1993. Filed date 30 Mar 1993. U.S. Patent Application 8-039,668. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009989. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A method is disclosed for encapsulating radioactive materials inside fullerenes for stable long-term storage. Fullerenes provide a safe and efficient means of disposing of nuclear waste which is extremely stable with respect to the environment. After encapsulation, a radioactive ion is essentially chemically isolated from its external environment.

15015 (PNL–10497) **Product consistency testing of three reference glasses in stainless steel and perfluoroalkoxy resin vessels.** Olson, K.M.; Smith, G.L.; Marschman, S.C. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010324. Source: OSTI; NTIS; INIS; GPO Dep.

Because of their chemical durability, silicate glasses have been proposed and researched since the mid-1950s as a medium for incorporating high-level radioactive waste (HLW) generated from processing of nuclear materials. A number of different waste forms were evaluated and ranked in the early 1980s; durability (leach resistance) was the highest weighted factor. Borosilicate glass was rated the best waste form available for incorporation of HLW. Four different types of vessels and three different glasses were used to study the possible effect of vessel composition on durability test results from the Production Consistency Test (PCT). The vessels were 45-m 304 stainless steel vessels, 150-m 304 L stainless steel vessels, and 60-m perfluoroalkoxy (PFA) fluoropolymer resin vessels. The three glasses were the Environmental Assessment glass manufactured by Corning Incorporated and supplied by Westinghouse Savannah River company, and West Valley Nuclear Services reference glasses 5 and 6, manufactured and supplied by Catholic University of America. Within experimental error, no differences were found in durability test results using the 3 different glasses in the 304L stainless steel or PFA fluoropolymer resin vessels over the seven-day test period.

15016 (PNL–10503) **Computer simulation of mobilization and mixing of kaolin with submerged liquid jets in 25,000-gallon horizontal cylindrical tanks.** Eyler, L.L.; Mahoney, L.A. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 65p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95009570. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents and analyzes results of computer model simulation of mobilization and mixing of kaolin using the TEMPEST code. The simulations are conducted in a horizontal cylindrical geometry replicating a 95 m^3 (25,000 gal) test tank at ORNL, which is scaled to approximate Melton Valley Storage tanks, which are 190 m^3 (50,000 gal). Mobilization and mixing is accomplished by two submerged liquid jets. Two configurations are simulated, one with the jets located at the center of the tank lengthwise and one with the jets located 1/4 tank length from one end. Computer simulations of both jet and suction configurations are performed. Total flow rates of 50, 100, and 200 gpm are modeled, corresponding to jet velocities of 1.52, 3.05, 6.10 m/s (5, 10, 20 ft/s). Calculations were performed to a time of 2 h for the center jet location and to a little over 1 h for the quarter jet location. This report presents computer and fluid properties model basis, preliminary numerical testing, and results. The results are presented in form of flow field and sludge layer contours. Degree of mobilization is presented as fraction of initial sludge layer remaining as a function of time. For the center jet location at 200 gpm, the sludge layer is completely mobilized in just over 1 h. For 100 gpm flow, about 5% of the sludge layer remains after 2 h. For 50 gpm flow, nearly 40% of the initial sludge layer remains after 2 h. For the quarter jets at 200 gpm, about 10% of the initial sludge layer remains after 1 h. For 100 gpm, about 40% of the sludge layer remains after 1 h. The boundary of the sludge layer is defined as 98% max packing for the particles. Mixing time estimates for these cases range from between 9.4 h and 16.2 h. A more critical evaluation and comparison of predictions and the test results is needed.

15017 (PNL–10508) **Estimation of natural ground water recharge for the performance assessment of a low-level waste disposal facility at the Hanford Site.** Rockhold, M.L.; Fayer, M.J.; Kincaid, C.T.; Gee, G.W. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010323. Source: OSTI; NTIS; INIS; GPO Dep.

In 1994, the Pacific Northwest Laboratory (PNL) initiated the Recharge Task, under the PNL Vitrification Technology Development (PVTD) project, to assist Westinghouse Hanford Company (WHC) in designing and assessing the performance of a low-level waste (LLW) disposal facility for the US Department of Energy (DOE). The Recharge Task was established to address the issue of ground water recharge in and around the LLW facility and throughout the Hanford Site as it affects the unconfined aquifer under the facility. The objectives of this report are to summarize the current knowledge of natural ground water recharge at the Hanford Site and to outline the work that must be completed in order to provide defensible estimates of recharge for use in the performance assessment of this LLW disposal facility. Recharge studies at the Hanford Site indicate that recharge rates are highly variable, ranging from nearly zero to greater than 100 mm/yr depending on precipitation, vegetative cover, and soil types. Coarse-textured soils without plants yielded the greatest recharge. Finer-textured soils, with or without plants, yielded the least. Lysimeters provided accurate, short-term measurements of recharge as well as water-balance data for the soil-atmosphere interface and root zone. Tracers provided estimates of longer-term average recharge rates in undisturbed settings. Numerical models demonstrated the sensitivity of recharge rates to different processes and forecast recharge rates for different conditions. All of these tools (lysimetry, tracers,

and numerical models) are considered vital to the development of defensible estimates of natural ground water recharge rates for the performance assessment of a LLW disposal facility at the Hanford Site.

15018 (PNL–10512) **Sludge pretreatment chemistry evaluation: Enhanced sludge washing separation factors.** Colton, N.G. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 110p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010325. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the work conducted in Fiscal Year 1994 by the Sludge Pretreatment Chemistry Evaluation Subtask for the Tank Waste Remediation System (TWRS) Tank Waste Treatment Science Task. The main purpose of this task, is to provide the technical basis and scientific understanding to support TWRS baseline decisions and actions, such as the development of an enhanced sludge washing process to reduce the volume of waste that will require high-level waste (HLW) vitrification. One objective within the Sludge Pretreatment Chemistry Evaluation Subtask was to establish wash factors for various SST (single-shell tank) sludges. First, analytical data were compiled from existing tank waste characterization reports. These data were summarized on tank-specific worksheets that provided a uniform format for reviewing and comparing data, as well as the means to verify whether the data set for each tank was complete. Worksheets were completed for 27 SST wastes. The analytical water wash data provided tank-specific information about the fraction of each component that dissolves with water, i.e., an estimate of tank-specific wash factors for evaluating tank-by-tank processing. These wash data were then used collectively to evaluate some of the wash factors that are assumed for the overall SST waste inventory; specifically, wash factors for elements that would be found primarily in sludges. The final step in this study was to incorporate the characterization and wash factor data into a spreadsheet that provides insight into the effect of enhanced sludge washing on individual tank sludges as well as for groups of sludges that may be representative of different waste types. Spreadsheet results include the estimated mass and percentage of each element that would be removed with washing and leaching. Furthermore, estimated compositions are given of the final wash and leach streams and residual solids, in terms of both concentration and dry weight percent.

15019 (PNL-SA–24451) **Membrane mediated separation of tritiated water from water without phase change.** Nelson, D.A.; Duncan, J.B.; Jensen, G.A.; Burton, S.D. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-941102–43: Winter meeting of the American Nuclear Society, Washington, DC (United States), 13-18 Nov 1994). Order Number DE95007810. Source: OSTI; NTIS; INIS; GPO Dep.

This development effort at the Pacific Northwest Laboratory (PNL) has been directed toward the separation of tritium (via ^{3}HOH or HTO) from contaminated ground water with the use of membrane technology. Tritium contamination exists in both aquifers and water used for reactor cooling and represents both a technical and financial challenge for the Department of Energy. Currently, the primary option for the remediation low-level tritium is migration with time through geological formations. However, point sources containing tritiated water can be attacked by separation technology, thus directly addressing environmental concerns. The separation technology reported here is especially applicable to tritium contaminated water generated in nuclear fuel storage basins. At Hanford, the dual K-Basins contain 1000 metric tons of fuel with cooling waters; the K-East Basin contains 5.7 million liters of water at 11.1 MBq (3 μCi/L). The K-West Basin contains 300,000 pCi/L also due to canister leakage. At the Savannah River Site, the L-Reactor Basin (15.2 million liters of water) and K-Reactor Disassembly Basins have held fuel rods for 5 years and many have corroded. Tritium levels are near that of the Hanford basins. At INEL, Building 603 stores more than 13,200 Kg of fuel rods in three pools of lesser volume than the Hanford or Savannah River Sites. Experience with membrane systems in industry indicates that they are inherently energy efficient. In the work at PNL, aromatic polyphosphazenes were chosen as the polymeric material for the membranes being investigated because they have been shown to possess excellent isothermal stability above 300°C and are quite robust under radiolysis conditions.

15020 (PNL-SA–24936) **Integration of pneumatic fracturing and in situ vitrification in the soil subsurface.** Luey, J. (Pacific Northwest Lab., Richland, WA (United States)); Seiler, D.K.; Schuring, J.R. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950216–86: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95009121. Source: OSTI; NTIS; INIS; GPO Dep.

Pacific Northwest Laboratory is evaluating ways to increase the applicability of the in situ vitrification (ISV) process at hazardous and radioactive waste sites. One innovation is the placement of a conductive material that will facilitate initiating the ISV process at a target depth. A series of laboratory tests performed at the New Jersey Institute of Technology (NJIT) assessed the feasibility of pneumatic fracturing (PF) in the highly permeable soils of the Hanford Site. The NJIT tests included an analysis of Hanford soils, a series of PF injection tests, and a parametric analysis to determine how soil properties affect the PF process. Results suggest that the PF process can be applied to Hanford soils and that dry medium (e.g., conductive material such as graphite flake) can be injected into the fracture. This paper describes the laboratory testing performed at NJIT, its results, and the application of those results to plans for a field demonstration at Hanford.

15021 (PNL-SA–25590) **An electronic design guideline for incorporating pollution prevention into U.S. Department of Energy design projects.** Greitzer, F.L. (Pacific Northwest Lab., Richland, WA (United States)); Brown, B.W.; Dorsey, J.A.; Stitzel, J.C.; Raney, E.A. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9503128–1: 1. international plant operations and design conference, Houston, TX (United States), 21-23 Mar 1995). Order Number DE95008935. Source: OSTI; NTIS; GPO Dep.

The Pacific Northwest Laboratory has developed a prototype pollution prevention electronic design guideline (EDG) for the U.S. Department of Energy (DOE), Waste Minimization Division (EM-334). The EDG contains a database of 267 opportunities to incorporate pollution prevention features into DOE design projects. Each opportunity provides supporting data that help the decisionmaker (designers, engineers, and project managers) evaluate the applicability and potential benefits of implementing pollution prevention in their particular project. The EDG's database was derived from both DOE and non-DOE sources including pollution prevention literature, industrial design personnel, and federal, state, and DOE sources. A key feature of the tool is the integration of photos, illustrations, and documentation to provide easy access to technical information on specific waste minimization opportunities in design. Historically, pollution prevention activities within the U.S. Department of Energy (DOE) have focused on existing process waste streams. However, it is estimated that 70% of the cost over the life of a product is fixed by design (i.e., before the product is constructed or used). In recognition of this pollution prevention opportunity, the DOE has funded the Hanford Site to incorporate it into the design of new products, processes, and facilities across the complex. Hanford Site contractors are now beginning their third year of leading this activity for DOE Headquarters (HQ).

15022 (PNL-SA–25649) **A Value of Information approach to data quality objectives for the Hanford high-level waste tanks.** Wood, T.W. (Pacific Northwest Lab., Richland, WA (United States)); Hunter, V.L.; Ulvila, J.W. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950216–117: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008936. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes a Pacific Northwest Laboratory review of the organic-nitrate reaction safety issue in the Hanford single-shell tanks. This study employed a decision analytic method known as Value of Information (VOI). VOI analysis is a special form of decision analysis that has an information collection alternative as one

of the initial decision choices. This type of decision analysis, therefore results in the ability to specify the preferred information collection alternative, taking into account all information gathering and other relevant alternatives. For example, the risk reduction benefit associated with further sampling to quantify total organic carbon inventory or to improve information on energetics can be compared to the risk reduction benefit of better temperature monitoring, operational restrictions, or mitigation by moisture control. This approach allows freedom from built-in assumptions, e.g., that all tanks must be sampled to some degree or that all tanks must be deemed intrinsically safe by some means or another. It allows for each tank management decision to be judged in terms of risk reduction from the current state of affairs, and for that state of affairs to be continuously updated to incorporate new information on tank contents, the phenomenology of safety issues, or the effectiveness of mitigation schemes.

15023 (RFP–4927) **Microwave waste processing technology overview.** Sprenger, G.S. (EG and G Rocky Flats, Inc., Golden, CO (United States)); Petersen, R.D. EG and G Rocky Flats, Inc., Golden, CO (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90RF62349. Order Number DE95010273. Source: OSTI; NTIS; INIS; GPO Dep.

Applications using microwave energy in the chemical processing industry have increased within the last ten years. Recently, interest in waste treatment applications process development, especially solidification, has grown. Microwave waste processing offers many advantages over conventional waste treatment technologies. These advantages include a high density, leach resistant, robust waste form, volume and toxicity reduction, favorable economics, in-container treatment, good public acceptance, isolated equipment, and instantaneous energy control. The results from the "cold" demonstration scale testing at the Rocky Flats nuclear weapons facility are described. Preliminary results for a transuranic (TRU) precipitation sludge indicate that volume reductions of over 80% are achievable over the current immobilization process. An economic evaluation performed demonstrated cost savings of $11.68 per pound compared to the immobilization process currently in use on wet sludge.

15024 (RFP–4928) **Analyses of vitrified waste.** Armentrout, D.L.; Carpenter, S.H. EG and G Rocky Flats, Inc., Golden, CO (United States). 19 Oct 1994. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90RF62349. Order Number DE95010275. Source: OSTI; NTIS; INIS; GPO Dep.

Surrogate wastes were melted in bench-scale microwave melter to evaluate glass frits. The ceramic crucibles were placed in 304 stainless steel cans and heated to 1300 C; during cooling, some of the crucibles broke, leaking the melt into the SS can. This report presents the findings of XRD, SEM, and energy dispersive x-ray analysis. It was found that: amorphous materials have the greatest homogeneity; measuring XRD is a good test of amorphous state; molten vitrified waste can absorb Cr from SS; and the vitrified waste is more durable than SiO_2.

15025 (SAND–92-2186) **Scenarios constructed for nominal flow in the presence of a repository at Yucca Mountain and vicinity.** Barr, G.E. (Sandia National Labs., Albuquerque, NM (United States)); Hunter, R.L.; Dunn, E.; Flint, A. Sandia National Labs., Albuquerque, NM (United States). Mar 1995. 218p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95009315. Source: OSTI; NTIS; INIS; GPO Dep.

Scenario development for the system performance assessment of the Yucca Mountain Site Characterization Project defines a scenario as a well-posed problem connecting an initiating event with radionuclide release to the accessible environment by a logical and physically possible combination or sequence of features, events, and processes. Drawing on the advice and assistance of the Project's principal investigators (PIs), a collection of release scenarios initiated by the nominal ground-water flow occurring in the vicinity of the potential Yucca Mountain high-level-waste repository is developed and described in pictorial form. This collection of scenarios is intended to provide a framework to assist PIs in recognizing essential field and calculational analyses, to assist performance assessment in providing guidance to site characterization, and to continue the effort to exhaustively identify all features, events, and processes important to releases. It represents a step in the iterative process of identifying what details of the potential site are important for safe disposal. 67 refs.

15026 (SAND–93-3997) **A review of the available technologies for sealing a potential underground nuclear waste repository at Yucca Mountain, Nevada.** Fernandez, J.A. (Sandia National Labs., Albuquerque, NM (United States)); Richardson, A.M. Sandia National Labs., Albuquerque, NM (United States). Nov 1994. 420p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95008439. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this report is to assess the availability of technologies to seal underground openings. The technologies are needed to seal the potential high-level radioactive waste repository at Yucca Mountain. Technologies are evaluated for three basic categories of seal components: backfill (general fill and graded fill), bulkheads, and grout curtains. Not only is placement of seal components assessed, but also preconditioning of the placement area and seal component durability. The approach taken was: First, review selected sealing case histories (literature searches and site visits) from the mining, civil, and defense industries; second, determine whether reasonably available technologies to seal the potential repository exist; and finally, identify deficiencies in existing technologies. It is concluded that reasonably available technologies do exist to place backfill, bulkheads, and grout curtains. Technologies also exist to precondition areas where seal components are to be placed. However, if final performance requirements are stringent for these engineered structures, some existing technologies may need to be developed. Deficiencies currently do exist in technologies that demonstrate the long-term durability and performance of seal components. Case histories do not currently exist that demonstrate the placement of seal components in greatly elevated thermal and high-radiation environments and in areas where ground support (rock bolts and concrete liners) has been removed. The as-placed, in situ material properties for sealing materials appropriate to Yucca Mountain are not available.

15027 (SAND–94-2134C) **Correlation of theoretical calculations and experimental measurements of damage around a shaft in salt.** Munson, D.E. (Sandia National Labs., Albuquerque, NM (United States)); Holcomb, D.J.; DeVries, K.L.; Brodsky, N.S.; Chan, K.S. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950655–3: 35. US symposium on rock mechanics, South Lake Tahoe, NV (United States), 4-7 Jun 1995). Order Number DE95004525. Source: OSTI; NTIS; INIS; GPO Dep.

Cross-hole ultrasonic measurements were made in the immediate wall of the Air Intake Shaft of the Waste Isolation Pilot Plant facility. These measurements show that compressional wave speed markedly decreases at the shaft wall and then increases with radial distance from the shaft to eventually become that of solid or undamaged salt. This behavior is indicative of deformation damage or microfractures in the salt. These in situ data are compared to both laboratory measurements of wave speed as a function of volume dilatancy and to calculations based on the Multimechanism Deformation Coupled Fracture model, with reasonable agreement.

15028 (SAND–94-2135C) **A damage mechanics approach to life prediction for a salt structure.** Chan, K.S. (Southwest Research Inst., San Antonio, TX (United States)); Bodner, S.R.; DeVries, K.L.; Fossum, A.F.; Munson, D.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950788–4: International conference on computational engineering science, Mauna Lani, HI (United States), 30 Jul - 3 aug 1995). Order Number DE95007732. Source: OSTI; NTIS; INIS; GPO Dep.

Excavated rooms in natural bedded salt formations are being considered for use as repositories for nuclear waste. It is presumed that deformation of the rooms by creep will lead to loss of structural integrity and affect room life history and seal efficiency.

At projected repository temperatures, two possible fracture mechanisms in salt are creep-induced microcracking in triaxial compression and cleavage in tension. Thus, an accurate prediction of room life and seal degradation requires a reliable description of the creep and damage processes. While several constitutive models that treat either creep or fracture in salt are available in the literature, very few models have considered creep and damage in a coupled manner. Previously, Munson and Dawson formulated a set of creep equations for salt based on the consideration of dislocation mechanisms in the creep process. This set of creep equations has been generalized to include continuum, isotropic damage as a fully coupled variable in the response equation. The extended model has been referred to as the Multimechanism Deformation Coupled Fracture (MDCF) model. A set of material constants for the creep and damage terms was deduced based on test data for both clean and argillaceous salt. In this paper, the use of the MDCF model for establishing the failure criteria and for analyzing the creep response of a salt structure is demonstrated. The paper is divided into three parts. A summary of the MDCF model is presented first, which is followed by an evaluation of the MDCF model against laboratory data. Finally, finite-element calculations of the creep and damage response of a salt structure are presented and compared against in-situ field measurements.

15029 (SAND–94-2136C) **Constitutive representation of damage development and healing in WIPP salt.** Chan, K.S. (Southwest Research Inst., San Antonio, TX (United States)); Bodner, S.R.; Fossum, A.F; Munson, D.E. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950655–2: 35. US symposium on rock mechanics, South Lake Tahoe, NV (United States), 4-7 Jun 1995). Order Number DE95004524. Source: OSTI; NTIS; INIS; GPO Dep.

There has been considerable interest in characterizing and modeling the constitutive behavior of rock salt with particular reference to long-term creep and creep failure. The interest is motivated by the projected use of excavated rooms in salt rock formations as repositories for nuclear waste. It is presumed that closure of those rooms by creep ultimately would encapsulate the waste material, resulting in its effective isolation. A continuum mechanics approach for treating damage healing is formulated as part of a constitutive model for describing coupled creep, fracture, and healing in rock salt. Formulation of the healing term is, described and the constitutive model is evaluated against experimental data of rock salt from the Waste Isolation Pilot Plant (WIPP) site. The results indicate that healing anistropy in WIPP salt can be modeled with an appropriate power-conjugate equivalent stress, kinetic equation, and evolution equation for damage healing.

15030 (SAND–94-2313C) **Dynamic compaction of salt: Initial demonstration and performance testing.** Hansen, F.D. (Sandia National Labs., Albuquerque, NM (United States)); Ahrens, E.H.; Tidwell, V.C.; Tillerson, J.R; Brodsky, N.S. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950655–4: 35. US symposium on rock mechanics, South Lake Tahoe, NV (United States), 4-7 Jun 1995). Order Number DE95004776. Source: OSTI; NTIS; INIS; GPO Dep.

Reconsolidated crushed salt is proposed as the sole long-term shaft seal between the Waste Isolation Pilot Plant (WIPP) and the biosphere. The concept for a long-term shaft seal for the WIPP repository is to place crushed salt in the four shafts and to develop an effective seal as the surrounding salt creeps into the shafts, reconsolidating the salt. Permeability of the salt components is calculated to achieve performance objectives at some acceptable time in the future, an expectation which is a key to performance assessment calculations for the WIPP. Such a seal has never been constructed, and until now no performance measurements have been made on an appropriately large scale. A full understanding of construction methods, achievable initial density and permeability and time-wise performance of reconsolidating salt is required. This paper discusses nearly full-scale dynamic compaction of mine-run WIPP salt, preliminary measurements of density and permeability, and their variability within a relatively large volume of compacted material.

15031 (SAND–94-2343C) **The influence of crushed rock salt particle gradation on compaction.** Ran, C. (Univ. of Nevada, Reno, NV (United States)); Daemen, J.J.K. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950655–5: 35. US symposium on rock mechanics, South Lake Tahoe, NV (United States), 4-7 Jun 1995). Order Number DE95008436. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents results of laboratory compaction testing to determine the influence of particle size, size gradation and moisture-content on compaction of crushed rock salt. Included is a theoretical analysis of the optimum size gradation. The objective is to evaluate the relative densities that can be achieved with tamping techniques. Initial results indicate that compaction increases with maximum particle size and compaction energy, and varies significantly with article size gradation and water content.

15032 (SAND–95-0324C) **Assessing alternative conceptual models of fracture flow.** Ho, C.K. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503116–1: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95008819. Source: OSTI; NTIS; INIS; GPO Dep.

The numerical code TOUGH2 was used to assess alternative conceptual models of fracture flow. The models that were considered included the equivalent continuum model (ECM) and the dual permeability (DK) model. A one-dimensional, layered, unsaturated domain was studied with a saturated bottom boundary and a constant infiltration at the top boundary. Two different infiltration rates were used in the studies. In addition, the connection areas between the fracture and matrix elements in the dual permeability model were varied. Results showed that the two conceptual models of fracture flow produced different saturation and velocity profiles-even under steady-state conditions. The magnitudes of the discrepancies were sensitive to two parameters that affected the flux between the fractures and matrix in the dual permeability model: (1) the fracture-matrix connection areas and (2) the capillary pressure gradients between the fracture and matrix elements.

15033 (SAND–95-0437C) **Interactive development of RADTRAN.** Neuhauser, K.S. (Sandia National Labs., Albuquerque, NM (United States)); Kanipe, F.L.; Weiner, R.F.; Yoshimura, H.R.; Joy, H.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950216–78: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008530. Source: OSTI; NTIS; INIS; GPO Dep.

The RADTRAN computer code for transportation risk analysis, which has been under continuous development at Sandia National Laboratories since 1977, has evolved from a purely research tool into a publicly available with a variety of applications. This expansion of the user community has substantially increased the need to make the system easier to use without decreasing its capabilities or the quality of output. A large set of modifiable RADTRAN input files has been available via TRANSNET for several years. One approach to assisting the user involves adding annotations/information to each of these files. A second approach is providing additional help in building new/modifying old input files. Keeping the proposed information/annotation files separate from but closely coupled to the modifiable input files within the TRANSNET shell system allows the modifiable input files to remain as regular input files while providing rapid, automatic access to, useful information about the analysis. In this way, the sample input files remain intact as regular RADTRAN input files and any files generated using associated on-line menus or editors may be readily converted into new input files. A single sample file is selected and used as an example to illustrate the prototype help features.

15034 (SAND–95-0495) **Hazardous materials management using a Cradle-to-Grave Tracking and Information System (CGTIS).** Kjeldgaard, E. (Sandia National Labs., Albuquerque, NM (United States)); Fish, J.; Campbell, D.; Freshour, N.; Hammond, B.; Bray, O.; Hollingsworth, M. Sandia National Labs., Albuquerque, NM (United States). Mar 1995. 181p. Sponsored by USDOE,

Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95009540. Source: OSTI; NTIS; INIS; GPO Dep.

Hazardous materials management includes interactions among materials, personnel, facilities, hazards, and processes of various groups within a DOE site's environmental, safety & health (ES&H) and line organizations. Although each group is charged with addressing a particular aspect of these properties and interactions, the information it requires must be gathered into a coherent set of common data for accurate and consistent hazardous material management and regulatory reporting. It is these common data requirements which the Cradle-to-Grave Tracking and Information System (CGTIS) is designed to satisfy. CGTIS collects information at the point at which a process begins or a material enters a facility, and maintains that information, for hazards management and regulatory reporting, throughout the entire life-cycle by providing direct on-line links to a site's multitude of data bases to bring information together into one common data model.

15035 (SAND–95-0564C) **Using TOUGH2 to model the coupled effects of gas generation, repository consolidation, and multiphase brine and gas flow at the Waste Isolation Pilot Plant.** Freeze, G.A. (INTERA Inc., Albuquerque, NM (United States)); Larson, K.W.; Davies, P.B.; Webb, S.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503116–5: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95009592. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) is a US Department of Energy facility designed to demonstrate the safe underground disposal of transuranic waste. Following waste emplacement, each room will be backfilled with crushed salt. Due to deviatoric stress introduced by excavation, the walls of the waste disposal rooms in the repository will deform over time, consolidating waste containers and salt backfill, thereby decreasing the void volume of the repository. Long-term repository assessment must consider the processes of gas generation, room closure and expansion due to salt creep, and multiphase (brine and gas) fluid flow, as well as the complex coupling between these three processes. Stone (1992) used the mechanical creep closure code SANCHO to simulate the closure of a single, perfectly sealed disposal room filled with waste and backfill. The results of the SANCHO f-series simulations provide a relationship between gas generation, room closure, and room pressure. Several methods for coupling this relationship with multiphase fluid flow into and out of a room were examined by Freeze et al. TOUGH2 was employed to couple the processes of gas generation, room closure/consolidation, and multiphase brine and gas flow. Two empirically-based methods for approximating salt creep and room consolidation were implemented in TOUGH2: the pressure-time-porosity line interpolation approach and the fluid-phase-salt approach. Both approaches utilized links to the SANCHO f-series simulation results to calculate room-void-volume changes with time during a simulation.

15036 (SAND–95-0565C) **The effect of stratigraphic dip on multiphase flow at the Waste Isolation Pilot Plant.** Webb, S.W.; Larson, K.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503116–6: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95009591. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) is a US Department of Energy research and development facility for the underground disposal of transuranic waste from US defense-related activities. The WIPP repository is located within the Salado Formation, which is comprised of beds of pure and impure halite with thin interbeds of anhydrite and related clay seams. This formation is brine saturated with a pore pressure of approximately 12.5 MPa at the repository horizon. The Salado Formation dips gently southeast, on the average approximately 1°, with steeper dips locally. Elevated repository pressures, caused by gas generated as emplaced waste corrodes and degrades, may drive brine and gas out of the repository into the surrounding formation. Stratigraphic dip may cause increased brine inflow to the repository through countercurrent flow in the interbeds and enhanced gas migration distances in the updip direction due to buoyancy. Two-dimensional simulations of isolated WIPP repository room have been performed using TOUGH2 for horizontal and 1° dipping stratigraphy. The impact of dip on multiphase flow at the WIPP may be significant. With dip, an additional mechanism for brine inflow may occur, namely the formation of a cell of countercurrent brine and gas flow in the interbeds. The additional volume of brine inflow resulting from the countercurrent flow cell may be of similar magnitude to brine inflow without dip. Therefore, dip must be included in any repository model to include the countercurrent brine inflow mechanism. Gas migration may also be significantly influenced due to dip. Gas migration distances may increase dramatically with preferential migration updip.

15037 (SAND–95-0568C) **Modification and application of TOUGH2 as a variable-density, saturated-flow code and comparison to SWIFT II results.** Christian-Frear, T.L.; Webb, S.W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503116–3: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95009596. Source: OSTI; NTIS; INIS; GPO Dep.

Human intrusion scenarios at the Waste Isolation Pilot Plant (WIPP) involve penetration of the repository and an underlying brine reservoir by a future borehole. Brine and gas from the brine reservoir and the repository may flow up the borehole and into the overlying Culebra formation, which is saturated with water containing different amounts of dissolved 'solids resulting in a spatially varying density. Current modeling approaches involve perturbing a steady-state Culebra flow field by inflow of gas and/or brine from a breach borehole that has passed through the repository. Previous studies simulating steady-state flow in the Culebra have been done. One specific study by LaVenue et al. (1990) used the SWIFT 2 code, a single-phase flow and transport code, to develop the steady-state flow field. Because gas may also be present in the fluids from the intrusion borehole, a two-phase code such as TOUGH2 can be used to determine the effect that emitted fluids may have on the steady-state Culebra flow field. Thus a comparison between TOUGH2 and SWIFT2 was prompted. In order to compare the two codes and to evaluate the influence of gas on flow in the Culebra, modifications were made to TOUGH2. Modifications were performed by the authors to allow for element-specific values of permeability, porosity, and elevation. The analysis also used a new equation of state module for a water-brine-air mixture, EOS7 (Pruess, 1991), which was developed to simulate variable water densities by assuming a miscible mixture of water and brine phases and allows for element-specific brine concentration in the INCON file.

15038 (SAND–95-0587C) **Summary of applications of TOUGH2 to the evaluation of multiphase flow processes at the WIPP.** Webb, S.W. (Sandia National Labs., Albuquerque, NM (United States)); Larson, K.W.; Freeze, G.A.; Christian-Frear, T.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503116–4: 1995 TOUGH workshop, Berkeley, CA (United States), 20-22 Mar 1995). Order Number DE95009593. Source: OSTI; NTIS; INIS; GPO Dep.

The Waste Isolation Pilot Plant (WIPP) is a US Department of Energy (DOE) research and development facility for the underground disposal of transuranic waste in southeastern New Mexico. The WIPP repository is located 655 m below the land surface in the lower portion of the Salado Formation, which is comprised of beds of pure and impure halite with thin interbeds of anhydrite and related clay seams. The regional dip of the Salado Formation is approximately 1° southeast in the vicinity of the repository. The proposed waste storage area has eight waste disposal panels, each of which will contain seven rooms. The repository is designed to follow a single stratigraphic horizon. Due to the dip, the north end of the repository will be about 10 meters higher than the south end. Waste that is emplaced in the disposal rooms will generate gas due to microbial degradation, anoxic corrosion, and radiolysis. Brine inflow to the rooms from the surrounding Salado Formation may significantly influence the gas generation rate and the total amount of gas generated. The salt surrounding the repository will

creep in response to the excavation, reducing the room volume. Gas generation in the room may increase the pressure sufficiently to drive brine and gas into the surrounding Salado Formation. Migration of gas and brine in the Salado is an important factor in evaluating the performance of the repository. The studies summarized in this paper have. been performed to evaluate brine and gas flow processes in the WIPP disposal system and to identify some of the important processes. These studies are done in support of, but are not part of, the formal Performance Assessment (PA) effort. Because of probabilistic and system-scale requirements, the PA effort uses the Sandia-developed BRAGFLO (BRine And Gas FLOw) code for multiphase flow calculations.

15039 (SKB-TR–94-16) **Kinetic and thermodynamic studies of uranium minerals. Assessment of the long-term evolution of spent nuclear fuel.** Casas, I. (MBT Tecnologia Ambiental, Cerdanyola (Spain)); Bruno, J.; Cera, E.; Finch, R.J.; Ewing, R.C. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Oct 1994. 80p. Order Number DE95627051. Source: OSTI; NTIS; INIS.

We have studied the dissolution behavior of uraninite, becquerelite, schoepite and uranophane. The information obtained under a variety of experimental conditions has been combined with extensive solid phase characterizations, performed in both leached and unleached samples. The overall objective is to construct a thermodynamic and kinetic model for the long-term oxidation alteration of UO_2(s), as an analogy of the spent nuclear fuel matrix. We have determined the solubility product for becquerelite ($logK_{s0}$ 32.7±1.3) and uranophane ($logK_{s0}$ = 7.8±0.8). In some experiments, the reaction progress has shown initial dissolution of uranophane followed by precipitation of a secondary solid phase, characterized as soddyite. The solubility production for this phase has been determined ($logK_{s0}$ = 3.0±2.9). We have studied the kinetics of dissolution of uraninite, uranophane and schoepite under oxidizing conditions in synthetic granitic groundwater. BET measurements have been performed for uraninite and uranophane. For schoepite, the measurement has not been performed due to lack of sufficient amount of sample. The normalized rates of dissolution of uraninite and uranophane have been calculated referred to the uranium release, as $1.97x10^{-8}$ moles h^{-1} m^{-2} and $4.0x\ 10^{-9}$ moles h^{-1} m^{-2}, respectively. For schoepite, the dissolution process has shown two different rates, with a relatively fast initial dissolution rate of $1.97x10^{-8}$ moles h^{-1} followed, after approximately 1000 hours, by a slower one of $1.4x10^{-9}$ moles h^{-1}. No formation of secondary phases has been observed in those experiments, although final uranium concentrations have in all cases exceeded the solubility of uranophane, the thermodynamically more stable phase under the experimental conditions. 24 refs, 45 figs.

15040 (SKB-TR–94-19) **Deep drilling KLX 02. Drilling and documentation of a 1700 m deep borehole at Laxemar, Sweden.** Andersson, O. (VBB VIAK AB, Malmoe (Sweden)). Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Aug 1994. 65p. Order Number DE95628830. Source: OSTI; NTIS; INIS.

In this report the preparation and execution of the deep core drilling KLX 02 is described. The hole was drilled with the wireline methods, NQ dimension (diameter 76 mm), to a final depth of 1700.5 m. Prior to core drilling a diameter 215 mm pilot hole was pre drilled to 200 m with controlled hammer drilling (DTH). In this hole casing and air-lift equipment was installed with the aim to support the circulation of drilling fluid. During core drilling there was a measurement of major drilling parameters and drilling fluid in and out of hole. As a fluid tracer uranine was used. Each 300 m of core drilling air-lift pump tests were performed. After completion a flow-meter log was run to finalize the project phase. It can be concluded that both the pre drilling and core drilling methods used proved to be successful. No severe technical problem occurred. However, potential risks have been pointed at in the report. The air-lift system functioned only partly and has to be modified for further use. Also the technique for monitoring of drilling parameters needs improvement as does the method for air-lift pump tests with packer. The organisation model for planning and realization functioned satisfactory and can be recommended for similar future projects. 9 refs, numerous tabs and figs.

15041 (SKB-TR–94-26) **A surface chemical model of the bentonite-water interface and its implications for modelling the near field chemistry in a repository for spent fuel.** Wieland, E. (MBT Umwelttechnik AG, Zuerich, (Switzerland)); Wanner, H.; Albinsson, Y.; Wersin, P.; Karnland, O. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jul 1994. 76p. Order Number DE95627052. Source: OSTI; NTIS; INIS.

Understanding the surface chemical properties of montmorillonite in near-neutral and alkaline media is essential for establishing a chemical model of the bentonite/water interaction applicable for repository conditions. A pretreated and well-characterised Wyoming MX-80 bentonite has been used for investigating the acid/base characteristics of Na-montmorillonite. The CEC of Na-montmorillonite was determined to 108 meq/100 g for pretreated bentonite and to 85 meq/100 g for the bulk material. The BET surface area was (31.53±0.16)m^2/g. Potentiometric titrations of montmorillonite suspensions at ionic strengths I=0.005 M, 0.05 M and 0.5 M were conducted as batch-type experiments. Deprotonation of surface OH groups possibly exposed at the edge surface causes an overall negative charge on the surface of montmorillonite in the alkaline pH range. In this pH range, the protolysis degree of OH groups increases with increasing pH and ionic strength. The proton density on the surface of montmorillonite increases with decreasing pH in the acidic pH range (pH<7.5). In this pH range, two simultaneously occurring surface reactions account for the observed proton density on montmorillonite: Protonation of edge OH groups and ion exchange of the major cations for H^+ at the structural-charge sites. The experimental results are interpreted in terms of a two-site model with structural-charge surface sites (X layer sites) and variable-charge surface sites (edge OH groups) as the reactive surface functionalities. The total population of the surface sites are estimated to TOT-OH=$2.84*10^{-5}$ mol/g, TOT-X=$2.22*10^{-5}$ mol/g. The intrinsic acidity constants for the OH groups are determined to pK^{int}_{a1}= (5.4±0.1) and pK^{int}_{a2}=(6-7±0.1), respectively, using th configuration of the diffuse double layer model (DDLM). 43 refs, 18 figs, 11 tabs.

15042 (SKB-TR–94-27) **Experimental study of strontium sorption on fissure filling material.** Eriksen, T.E. (Royal Institute of Technology, Stockholm (Sweden). Dept. of Chemistry); Cui, Daqing. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1994. 31p. Order Number DE95628831. Source: OSTI; NTIS; INIS.

We have carried out a comparative study of sorption and desorption of strontium in groundwater on separated magnetic and size fractions of fissure filling material taken from natural fissures in granitic rock. Complete reversibility of the sorption process was demonstrated by identical Freundlich isotherms, isotopic exchangeability and pH dependence of the distribution coefficients Rd. The sorption was found to be strongly pH dependent in the range 3-11. The pH effect can be accommodated in the sorption model by considering the surface areas and surface charges of the minerals in the fissure filling material. 20 refs, 9 figs, 3 tabs.

15043 (SKB-TR–94-29) **Heat conductivity of buffer materials.** Boergesson, L. (Clay Technology AB, Lund (Sweden)); Fredrikson, Anders; Johannesson, L.E. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Nov 1994. 63p. Order Number DE95628832. Source: OSTI; NTIS; INIS.

The report deals with the thermal conductivity of bentonite based buffer materials. An improved technique for measuring the thermal conductivity of buffer materials is described. Measurements of FLAC calculations applying this technique have led to a proposal of how standardized tests should be conducted and evaluated. The thermal conductivity of bentonite with different void ratio and degree of water saturation has been determined in the following different ways: * Theoretically according to three different investigations by other researchers. * Laboratory measurements with the proposed method. * Results from back-calculated field tests. Comparison and evaluation showed that these results agreed very well, when the buffer material was almost water saturated. However, the influence of the degree of saturation was not very well predicted with the theoretical methods. Furthermore, the field tests showed

that the average thermal conductivity in situ of buffer material (compacted to blocks) with low degree of water saturation was lower than expected from laboratory tests. 12 refs, 29 figs, 11 tabs.

15044 (SKB-TR–94-30) **Calibration with respect to hydraulic head measurements in stochastic simulation of groundwater flow - a numerical experiment using MATLAB.** Eriksson, L.O. (Starprog AB (Sweden)); Oppelstrup, J. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Dec 1994. 62p. Order Number DE95628833. Source: OSTI; NTIS; INIS.

A simulator for 2D stochastic continuum simulation and inverse modelling of groundwater flow has been developed. The simulator is well suited for method evaluation and what-if simulation and written in MATLAB. Conductivity fields are generated by unconditional simulation, conditional simulation on measured conductivities and calibration on both steady-state head measurements and transient head histories. The fields can also include fracture zones and zones with different mean conductivities. Statistics of conductivity fields and particle travel times are recorded in Monte-Carlo simulations. The calibration uses the pilot point technique, an inverse technique proposed by RamaRao and LaVenue. Several Kriging procedures are implemented, among others Kriging neighborhoods. In cases where the expectation of the log-conductivity in the truth field is known the nonbias conditions can be omitted, which will make the variance in the conditionally simulated conductivity fields smaller. A simulation experiment, resembling the initial stages of a site investigation and devised in collaboration with SKB, is performed and interpreted. The results obtained in the present study show less uncertainty than in our preceding study. This is mainly due to the modification of the Kriging procedure but also to the use of more data. Still the large uncertainty in cases of sparse data is apparent. The variogram represents essential characteristics of the conductivity field. Thus, even unconditional simulations take account of important information. Significant improvements in variance by further conditioning will be obtained only as the number of data becomes much larger. 16 refs, 26 figs.

15045 (SWE-SWB–95-0004) **Waste Minimization Measurement and Progress Reporting.** Stone, K.A. Westinghouse Savannah River Co., Aiken, SC (United States). 13 Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950216–118: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95060100. Source: OSTI; NTIS; INIS; GPO Dep.

Westinghouse Savannah River Company is implementing productivity improvement concepts into the Waste Minimization Program by focusing on the positive initiatives taken to reduce waste generation at the Savannah River Site. Previous performance measures, based only on waste generation rates, proved to be an ineffective metric for measuring performance and promoting continuous improvements within the Program. Impacts of mission changes and non-routine operations impeded development of baseline waste generation rates and often negated waste generation trending reports. A system was developed to quantify, document and track innovative activities that impact waste volume and radioactivity/toxicity reductions. This system coupled with Management-driven waste disposal avoidance goals is proving to be a powerful tool to promote waste minimization awareness and the implementation of waste reduction initiatives. Measurement of waste not generated, in addition to waste generated, increases the credibility of the Waste Minimization Program, improves sharing of success stories, and supports development of regulatory and management reports.

15046 (UCRL-ID–116187-94-11) **The Mixed Waste Management Facility monthly report for November 1994.** Lawrence Livermore National Lab., CA (United States). Dec 1994. 59p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (L–18869-1). Order Number DE95009883. Source: OSTI; NTIS; GPO Dep.

During November, technical progress continued in accordance with the FY95 Plan (the FY95 Plan document will be issued in early December). Engineering development and design activities continued in support of the preliminary design (PD) of MWMF major subsystems, although certain systems are now scheduled for a late-phased PD to accommodate DOE funding constraints. Management focus during November centered on completion of key documentation in support of the FY96 DWTF Validation and Baseline Change Proposal. This was of particular importance as a result of the DOE decision to co-locate DWTF (LLNL Hazardous Waste Management operations) and MWMF into a common complex and to merge specific functions. Documentation was completed on time and presented to the project validators on December 1, 1994. In addition, significant progress was made on the FY95 Plan and Revision 1.2 of the MWMF Project Baseline (to incorporate integration with DWTF) using the latest guidance from DOE for funding availability. The FY95 Plan has been essentially completed and is now scheduled to be issued in early December. Finally, an overview of the MWMF Project was presented at the Environmental Business Opportunities meeting at LLNL - a forum organized by LLNL to reach small and disadvantaged businesses.

15047 (UCRL-ID–119720) **Expedited demonstration of molten salt mixed waste treatment technology. Final report.** Lawrence Livermore National Lab., CA (United States). 2 Feb 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009473. Source: OSTI; NTIS; INIS; GPO Dep.

This final report discusses the molten salt mixed waste project in terms of the various subtasks established. Subtask 1: Carbon monoxide emissions; Establish a salt recycle schedule and/or a strategy for off-gas control for MWMF that keeps carbon monoxide emission below 100 ppm on an hourly averaged basis. Subtask 2: Salt melt viscosity; Experiments are conducted to determine salt viscosity as a function of ash composition, ash concentration, temperature, and time. Subtask 3: Determine that the amount of sodium carbonate entrained in the off-gas is minimal, and that any deposited salt can easily be removed form the piping using a soot blower or other means. Subtask 4: The provision of at least one final waste form that meets the waste acceptance criteria of a landfill that will take the waste. This report discusses the progress made in each of these areas.

15048 (UCRL-JC–118317) **Characterization of waste drums using nonintrusive active and passive computed tomography.** Roberson, G.P.; Martz, H.E.; Decman, D.J.; Camp, D.C.; Azevedo, S.G.; Keto, E.R. Lawrence Livermore National Lab., CA (United States). Aug 1994. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940216–8: Nondestructive assay and nondestructive examination waste chracterization conference, Pocatello, ID (United States), 14-16 Feb 1994). Order Number DE95008830. Source: OSTI; NTIS; INIS; GPO Dep.

We have developed a data acquisition scanner for gamma-ray nondestructive assay (NDA) active and passive computed tomography (A&PCT) along with associated computational techniques for image reconstruction, analysis, and display. We are using this scanner to acquire data sets of mock-waste drums at Lawrence Livermore National Laboratory (LLNIL). In this paper, we discuss some issues associated with gamma-ray spectroscopy assay, NDA imaging, describe the design and construction of an NDA drum scanner and report on code development for image reconstruction. We also present representative A&PCT assay results of well characterized mock-waste drums. These preliminary results suggest that A&PCT imaging can be used to produce accurate absolute assays of radioactivity in real-waste drums.

15049 (UCRL-JC–118741-Rev.1) **Utilization of Cs^{137} to generate a radiation barrier for weapons grade plutonium immobilized in borosilicate glass canisters. Revision 1.** Jardine, L.J.; Armantrout, G.A.; Collins, L.F. Lawrence Livermore National Lab., CA (United States). Jan 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950216–111-Rev.1: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95009844. Source: OSTI; NTIS; INIS; GPO Dep.

One of the ways recommended by a recent National Academy of Sciences study to dispose of excess weapons-grade plutonium is to encapsulate the plutonium in a glass in combination with high-level radioactive wastes (HLW) to generate an intense radiation dose rate field. The objective is to render the plutonium as difficult to access as the plutonium contained in existing US commercial spent light-water reactor (LWR) fuel until it can be disposed of in a

permanent geological repository. A radiation dose rate from a sealed canister of 1,000 rem/h (10 Sv/h) at 1 meter for at least 30 years after fabrication was assumed in this paper to be a radiation dose comparable to spent LWR fuel. This can be achieved by encapsulating the plutonium in a borosilicate glass with an adequate amount of a single fission product in the HLWS, namely radioactive Cs^{137}. One hundred thousand curies of Cs^{137} will generate a dose rate of 1,000 rem/h (10 Sv/h) at 1 meter for at least 30 years when imbedded into canisters of the size proposed for the Savannah River Site's vitrified high-level wastes. The United States has a current inventory of 54 MCi of CS^{137} that has been separated from defense HLWs and is in sealed capsules. This single curie inventory is sufficient to spike 50 metric tons of excess weapons-grade plutonium if plutonium can be loaded at 5.5 wt% in glass, or 540 canisters. Additional CS^{137} inventories exist in the United States' HLWs from past reprocessing operations, should additional curies be required. Using only one fission product, CS^{137}, rather than the multiple chemical elements and compounds in HLWs to generate a high radiation dose rate from a glass canister greatly simplifies the processing engineering retirement for encapsulating plutonium in a borosilicate glass.

15050 (UCRL-JC–118901) **Stabilization of inorganic mixed waste to pass the TCLP and STLC tests using clay and pH-insensitive additives.** Bowers, J.S. (Lawrence Livermore National Lab., CA (United States). Hazardous Waste Management Div.); Anson, J.R.; Painter, S.M.; Maitino, R.E. Lawrence Livermore National Lab., CA (United States). Mar 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504134–2: HAZMACON '95: hazardous materials management conference and exhibition, San Jose, CA (United States), 4-6 Apr 1995). Order Number DE95009534. Source: OSTI; NTIS; INIS; GPO Dep.

Stabilization traps toxic contaminants (usually both chemically and physically) in a matrix so that they do not leach into the environment. Typical contaminants are metals (mostly transition metals) that exhibit the characteristic of toxicity. The stabilization process routinely uses pozzolanic materials. Portland cement, fly ash-lime mixes, gypsum cements, and clays are some of the most common materials. In many instances, materials that can pass the Toxicity Characteristic Leaching Procedure (TCLP-the federal leach test) or the Soluble Threshold Leachate Concentration (STLC-the California leach test) must have high concentrations of lime or other caustic material because of the low pH of the leaching media. Both leaching media, California's and EPA's, have a pH of 5.0. California uses citric acid and sodium citrate while EPA uses acetic acid and sodium acetate. These media can form ligands that provide excellent metal leaching. Because of the aggressive nature of the leaching medium, stabilized wastes in many cases will not pass the leaching tests. At the Lawrence Livermore National Laboratory, additives such as dithiocarbamates and thiocarbonates, which are pH-insensitive and provide resistance to ligand formation, are used in the waste stabilization process. Attapulgite, montmorillonite, and sepiolite clays are used because they are forgiving (recipe can be adjusted before the matrix hardens). The most frequently used stabilization process consists of a customized recipe involving waste sludge, clay and dithiocarbamate salt, mixed with a double planetary mixer into a pasty consistency. TCLP and STLC data on this waste matrix have shown that the process matrix meets land disposal requirements.

15051 (UCRL-JC–118902) **Treatment of mixed waste coolant.** Kidd, S. (Lawrence Livermore National Lab., CA (United States). Hazardous Waste Management Div.); Bowers, J.S. Lawrence Livermore National Lab., CA (United States). Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9504134–1: HAZMACON '95: hazardous materials management conference and exhibition, San Jose, CA (United States), 4-6 Apr 1995). Order Number DE95009535. Source: OSTI; NTIS; INIS; GPO Dep.

The primary processes used at Lawrence Livermore National Laboratory (LLNL) for treatment of radioactively contaminated machine coolants are industrial waste treatment and in situ carbon adsorption. These two processes simplify approaches to meeting the sanitary sewer discharge limits and subsequent Land Disposal Restriction criteria for hazardous and mixed wastes (40 CFR 268). Several relatively simple technologies are used in industrial water treatment. These technologies are considered Best Demonstrated Available Technologies, or BDAT, by the Environmental Protection Agency. The machine coolants are primarily aqueous and contain water soluble oil consisting of ethanol amine emulsifiers derived from fatty acids, both synthetic and natural. This emulsion carries away metal turnings from a part being machined on a lathe or other machining tool. When the coolant becomes spent, it contains chlorosolvents carried over from other cutting operations as well as a fair amount of tramp oil from machine bearings. This results in a multiphasic aqueous waste that requires treatment of metal and organic contaminants. During treatment, any dissolved metals are oxidized with hydrogen peroxide. Once oxidized, these metals are flocculated with ferric sulfate and precipitated with sodium hydroxide, and then the precipitate is filtered through diatomaceous earth. The emulsion is broken up by acidifying the coolant. Solvents and oils are adsorbed using powdered carbon. This carbon is easily separated from the remaining coolant by vacuum filtration.

15052 (WHC-MR–0484) **Hazardous material reduction initiative.** Nichols, D.H. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008790. Source: OSTI; NTIS; INIS; GPO Dep.

The Hazardous Material Reduction Initiative (HMRI) explores using the review of purchase requisitions to reduce both the use of hazardous materials and the generation of regulated and nonregulated wastes. Based on an 11-month program implemented at the Hanford Site, hazardous material use and waste generation was effectively reduced by using a centralized procurement control program known as HMRI. As expected, several changes to the original proposal were needed during the development/testing phase of the program to accommodate changing and actual conditions found at the Hanford Site. The current method requires a central receiving point within the Procurement Organization to review all purchase requisitions for potentially Occupational Safety and Health Administration (OSHA) hazardous products. Those requisitions (approximately 4% to 6% of the total) are then forwarded to Pollution Prevention personnel for evaluation under HMRI. The first step is to determine if the requested item can be filled by existing or surplus material. The requisitions that cannot filled by existing or surplus material are then sorted into two groups based on applicability to the HMRI project. For example, laboratory requests for analytical reagents or standards are excluded and the purchase requisitions are returned to Procurement for normal processing because, although regulated, there is little opportunity for source reduction due to the strict protocols followed. Each item is then checked to determine if it is regulated or not. Regulated items are prioritized based on hazardous contents, quantity requested, and end use. Copies of these requisitions are made and the originals are returned to Procurement within 1-hr. Since changes to the requisition can be made at later stages during procurement, the HMRI fulfills one of its original premises in that it does not slow the procurement process.

15053 (WHC-SA–2675) **LLW solidification in cement: Effect of dilution.** Kruger, A.A. (Westinghouse Hanford Co., Richland, WA (United States)); Katz, A.; Brough, A.R.; Bakharev, T.; Kirkpatrick, R.J.; Struble, L.J.; Young, J.F. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Grant MJGSVV-097600. (CONF-941144–120: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95010108. Source: OSTI; NTIS; INIS; GPO Dep.

A simulated Low Level nuclear Waste (LLW) solution was tested for long term solidification in a cement-based matrix. The waste is characterized by high pH and high concentrations of sodium, aluminum, nitrate, nitrite, phosphate and carbonate. The effect of diluting the waste with additional water was studied. The cementitious matrix was composed of cement, fly-ash and clay (21%, 68% and 11% respectively) with high solution to solid ratio (1 liter /1 kg.). Mixes were prepared at 45°C and cured at 90°C for 28 days. Maximum 28 day compressive strengths and early age heat evolution were achieved by diluting the LLW solution to approximately

67% of its original concentration. More dilution led to a lower heat evolution and compressive strength. No dilution was found to give lower compressive strength, and a heat evolution that was delayed, and lower in intensity. XRD spectra showed formation of zeolites and tobermorite at the higher concentrations (67, 85, and 100% of the concentration of the undiluted simulated LLW), with a change from Na-Pl zeolite for 67% of the undiluted concentration to a sodalite at 100%. SEM observations showed a porous system for the low and high dilution rates but a less porous one for an intermediate level of dilution.

15054 (WHC-SA–2676) **Microstructural aspects of zeolite formation in alkali activated cements containing high levels of fly ash.** Kruger, A.A. (Westinghouse Hanford Co., Richland, WA (United States)); Brough, A.R.; Katz, A.; Bakharev, T.; Sun, G.K.; Kirkpatrick, R.J.; Struble, L.J.; Young, J.F. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-941144–122: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95010107. Source: OSTI; NTIS; INIS; GPO Dep.

Wasteforms made by reaction at elevated temperature of a highly e simulated low level nuclear waste solution, having high sodium ion concentration, with a cementitious blend high in fly ash have been studied. Significant formation of Na-P1 zeolite (gismondine framework) and of a sodalite occurred. The time evolution of the crystalline phases over the first 28 days is reported for both adiabatic and isothermal curing, and the role of these phases in microstructure development is discussed. The level of carbonate ions in solution was found to have a substantial effect on strength evolution and chemistry.

15055 (WHC-SA–2729) **Long term decontamination at the Hanford Site: A case study.** Geuther, W.J. (Westinghouse Hanford Co., Richland, WA (United States)); Hansen, G.E. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-941102–44: Winter meeting of the American Nuclear Society, Washington, DC (United States), 13-18 Nov 1994). Order Number DE95007795. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes an engineering study that evaluates decontamination requirements at Hanford and the potential reutilization of the first plutonium processing production facility as a decontamination facility. The logic used to develop the study, the options available for a long-term decontamination mission, and the resultant strategy recommended in the study are presented. The paper provides a starting point for other similar study efforts. The process flowsheets, regulatory restrictions, and preconceptual designs developed in this study are common throughout the nuclear waste industry.

15056 (WHC-SD-CP-TP–083) **Test plan for non-radioactive testing of vertical calciner for development of direct denitration conversion of Pu-bearing liquors to stable, storage solids.** Fisher, F.D. Westinghouse Hanford Co., Richland, WA (United States). 30 Mar 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010091. Source: OSTI; NTIS; INIS; GPO Dep.

Plutonium-bearing liquors, including ANL scrap liquors, will be used for development and demonstration of a vertical calciner direct denitration process for conversion of those liquors to stable, storable PuO_2-rich solids. This test plan is to test with non-radioactive stand-in materials to demonstrate adequate performance of the vertical calciner and ancillary equipment.

15057 (WHC-SD-EN-AP–184) **Hanford Wells Integrity Inspection Plan for the ROM Program.** Dorsey, M.C. Westinghouse Hanford Co., Richland, WA (United States). 4 Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010089. Source: OSTI; NTIS; INIS; GPO Dep.

This supporting document specifies the technical requirements, schedule, and process for conducting well integrity inspections and rehabilitation on resource protection wells under the custodianship of the RCRA and Operational Monitoring program.

15058 (WHC-SD-EN-EE–014) **Hanford site comprehensive site compliance evaluation report.** Burris, S.A.; Menard, N.M. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 123p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010074. Source: OSTI; NTIS; INIS; GPO Dep.

This document is the first annual submittal by Westinghouse Hanford Company (WHC) and contains the results of inspections of the storm water outfalls listed in the Hanford Site Storm Water Pollution Prevention Plan (SWPPP) (WHC 1993a) as required by General Permit No. WA-R-00-OOOF (WA-R-00-Al7F). This report also describes the methods used to conduct the Comprehensive Site Compliance Evaluation (CSCE), as required in Part IV, Section D. 4. c of the General Permit, summarizes the results of the compliance evaluation, and documents significant leaks and spills.

15059 (WHC-SD-EN-QAPP–003-Rev.2) **Waste handling Quality Assurance Program Plan for Engineered Process Applications. Revision 2.** Biyani, R.K. Westinghouse Hanford Co., Richland, WA (United States). 30 Mar 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010147. Source: OSTI; NTIS; INIS; GPO Dep.

This plan describes methods which Engineered Process Applications personnel use to ensure that waste managed by them is in accordance with WHC-EP-0063, Hanford Site Solid Waste Acceptance Criteria. Hazardous waste, low-level waste, and mixed waste are covered.

15060 (WHC-SD-ER3297-TS–001-Rev.2) **Test specification for decant pump and winch assembly. Revision 2.** Staehr, T.W. Westinghouse Hanford Co., Richland, WA (United States). 22 Feb 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008433. Source: OSTI; NTIS; INIS; GPO Dep.

This specification provides the requirements for testing of the vertical turbine decant pump including the floating suction with load sensing winch control, instrumentation and the associated PLC/PC control system. All assembly necessary for testing including piping, temporary wiring, etc., shall be performed by the Seller. All referenced figures are at the back of this document. The testing consists of performance testing, winch testing and calibration, instrumentation verification testing and run-in testing of the pump. Testing shall be done in the presence and under the direction of the Buyer in accordance with this procedure.

15061 (WHC-SD-ETF-PCP–001) **Control system troubleshooting guide for the 300 area treated effluent disposal facility.** McCarthy, R.J.; Whitehurst, R.; Knox, J.M.; Hultgrenn, H.M.; Bleazard, K. Westinghouse Hanford Co., Richland, WA (United States). 8 Aug 1994. 246p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010061. Source: OSTI; NTIS; INIS; GPO Dep.

This supporting Document is intended to be used to help locate problems with the 300 Area Treated Effluent Disposal Facility (TEDF) computer Control System.

15062 (WHC-SD-GN-TRP–30021) **Load test of the 306E Building roof deck and support structure.** McCoy, R.M. Westinghouse Hanford Co., Richland, WA (United States). 30 Jan 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009152. Source: OSTI; NTIS; GPO Dep.

This reports the results of the load test of the 306E Building roof deck and support structures.

15063 (WHC-SD-LEF-CSCM–001) **Computer software configuration management plan for 200 East/West Liquid Effluent Facilities.** Graf, F.A. Jr. Westinghouse Hanford Co., Richland, WA (United States). 27 Feb 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008500. Source: OSTI; NTIS; INIS; GPO Dep.

This computer software management configuration plan covers the control of the software for the monitor and control system that

operates the Effluent Treatment Facility and its associated truck load in station and some key aspects of the Liquid Effluent Retention Facility that stores condensate to be processed. Also controlled is the Treated Effluent Disposal System's pumping stations and monitors waste generator flows in this system as well as the Phase Two Effluent Collection System.

15064 (WHC-SD-LEF-OTR–001) **200 Area treated effluent disposal facility operational test report.** Crane, A.F. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 184p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008801. Source: OSTI; NTIS; INIS; GPO Dep.

This document reports the results of the 200 Area Treated Effluent Disposal Facility (200 Area TEDF) operational testing activities. These completed operational testing activities demonstrated the functional, operational and design requirements of the 200 Area TEDF have been met.

15065 (WHC-SD-LEF-QAPP–002) **200 Area Treated Effluent Disposal Facility Quality Assurance Project Plan.** Jungfleisch, F.M. Westinghouse Hanford Co., Richland, WA (United States). 24 Mar 1995. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010149. Source: OSTI; NTIS; INIS; GPO Dep.

The project plan provides for the quality assurance of the 200 Area Treated Effluent Disposal Facility consistent with the Washington State Department of Ecology discharge monitoring permit. DQOs (data quality objective) support permit standards for data quality and quantity. Reference is made to groundwater monitoring, laboratory analyses, and data validation that are performed under related quality programs.

15066 (WHC-SD-LEF-TS–001-Rev.2) **200 Area Treated Effluent Disposal Facility operational test specification. Revision 2.** Crane, A.F. Westinghouse Hanford Co., Richland, WA (United States). 9 Feb 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007794. Source: OSTI; NTIS; INIS; GPO Dep.

This document identifies the test specification and test requirements for the 200 Area Treated Effluent Disposal Facility (200 Area TEDF) operational testing activities. These operational testing activities, when completed, demonstrate the functional, operational and design requirements of the 200 Area TEDF have been met. The technical requirements for operational testing of the 200 Area TEDF are defined by the test requirements presented in Appendix A. These test requirements demonstrate the following: pump station No.1 and associated support equipment operate both automatically and manually; pump station No. 2 and associated support equipment operate both automatically and manually; water is transported through the collection and transfer lines to the disposal ponds with no detectable leakage; the disposal ponds accept flow from the transfer lines with all support equipment operating as designed; and the control systems operate and status the 200 Area TEDF including monitoring of appropriate generator discharge parameters.

15067 (WHC-SD-SNF-DRP–001) **Design Reconstitution Program Plan and procedures for K Basins.** Laney, T. Westinghouse Hanford Co., Richland, WA (United States). 12 Jan 1995. 58p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008035. Source: OSTI; NTIS; INIS; GPO Dep.

This document establishes a systematic program to establish, organize, and document the design basis and design requirement information for the K Basins where existing design information is inadequate. The Design Reconstitution Program involves identifying and retrieving design information from identified source documents; evaluating, verifying, and validating the design information; resolving discrepancies; regenerating missing critical design information; and preparing and issuing a summary document of the design information. Upon completion, the design requirements shall be evaluated with the facility as-found configuration to verify the adequacy of appropriate design requirements with the as-found configuration and to document and resolve any discovered discrepancies. Once the design requirement (design analysis, calculation, design basis) comparison is made and discrepancies resolved (dispositioned, implemented, and incorporated as required), the as-found condition of a drawing then becomes an as-built drawing that is released into the engineering release system. This as-built drawing is then the accurate accounting of the field configuration that is consistent with the design requirements (recovered through the design reconstitution program) and is used with high confidence to make valid engineering, operational, and maintenance decisions.

15068 (WHC-SD-SNF-SD–002) **Spent Nuclear Fuel Project technical baseline document. Volumes 1–4, FY 1994.** Womack, J.C. Westinghouse Hanford Co., Richland, WA (United States). 3 Apr 1995. 864p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010097. Source: OSTI; NTIS; INIS; GPO Dep.

The Technical Baseline document presents the results of the SNFP systems engineering analyses to date. These analyses establish the baseline functions, requirements, and interfaces to a level necessary to complete the SNFP mission as defined in the SNFP Mission Analysis Report (Volume II). It is a summary-level description of the activities necessary to successfully complete the SNFP mission. The time relationship of these activities is depicted in a two page Activities Logic Diagram (Figure 1.0-1). This document lacks detail in some areas because a clear programmatic and technical path forward is currently under development, and several key trade studies are yet to be completed. A narrative baseline description has been provided as a basis for a point of departure for individual trade studies and further ANFP definition and development. This document is composed of four volumes. Volume I presents the SNFP baseline description. Volume II presents an updated version of the Mission Analysis Report. Volume III presents the results of the functions and requirements analyses, which is an update of the draft of the SNFP Functions and Requirements Document. The initial alternatives analyses are also included in this volume. Volume IV presents the supporting data for the first three volumes.

15069 (WHC-SD-SNF-TP–009-Rev.1) **105-KE/KW isolation barrier leak test specification/test plan. Revision 1.** McCracken, K.J. Westinghouse Hanford Co., Richland, WA (United States). 28 Mar 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010056. Source: OSTI; NTIS; GPO Dep.

This supporting document uses an ECN to remove and replace pages in the 105-KE/KW test spec/test plan to clarify portions and correct administrative errors noted during recent reviews. No changes invalidate any safety or theory concerns.

15070 (WHC-SD-SNF-TP–011) **K-Basins debris removal equipment - test plan.** Pitkoff, C.C. Westinghouse Hanford Co., Richland, WA (United States). 28 Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008471. Source: OSTI; NTIS; INIS; GPO Dep.

An undetermined amount of debris remains in the K-Basins which must be removed. Due to the different types of debris that will be removed, a variety of tools will be required to complete this project. This test plan gives s broad scope of the requirements that will be used for testing equipment for K-Basin debris removal. The equipment tested will be used in a radioactive environment. The equipment tested will be used to retrieve, cut, clean, and package debris from both K West and K East Basins. Testing is typically divided into six primary categories: development testing, acceptance testing, qualification testing, pre-operational testing, operational testing, and production/process testing.

15071 (WHC-SD-SNF-TP–013) **Test plan for K Basin Sludge Canister and Floor Sampling Device.** Meling, T.A. Westinghouse Hanford Co., Richland, WA (United States). 28 Mar 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010145. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the test plan and procedure forms for conducting the functional and operational acceptance testing of the K Basin Sludge Canister and Floor Sampling Device(s). These samplers samples sludge off the floor of the 100K Basins and out of 100K fuel storage canisters.

15072 (WHC-SD-TP-SEP–029) **Safety evaluation for packaging transfer of 101-AZ thermocouples.** Carlstrom, R.F. Westinghouse Hanford Co., Richland, WA (United States). 3 Mar 1995. 345p. DOE Contract AC06-87RL10930. Order Number DE95010075. Source: OSTI; NTIS; INIS; GPO Dep.

This Safety Evaluation for Packaging (SEP) provides evaluations and analysis considered necessary to approve a short-term onsite transfer campaign of seven thermocouples for the AZ tank to the Central Waste Complex (CWC). The SEP demonstrates that the transfer will provide an equivalent degree of safety as would be provided by the transfer of similar packages meeting the U.S. Department of Energy (DOE)/U.S. Nuclear Regulatory Commission (NRC) requirements. This fulfills onsite transportation requirements implemented by WHC-CM-2-14, Hazardous Material Packaging and Shipping.

15073 (WHC-SD-W026-PLN–006) **WRAP Module 1 sampling and analysis plan.** Mayancsik, B.A. Westinghouse Hanford Co., Richland, WA (United States). 24 Mar 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010148. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the methodology to sample, screen, and analyze waste generated, processed, or otherwise the responsibility of the Waste Receiving and Processing Module 1 facility. This includes Low-Level Waste, Transuranic Waste, Mixed Waste, and Dangerous Waste.

15074 (WHC-SD-W026-QAPP–001-Rev.1) **Quality Assurance Project Plan, W-026. Revision 1.** McGee, J.R. Westinghouse Hanford Co., Richland, WA (United States). 4 Apr 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010105. Source: OSTI; NTIS; INIS; GPO Dep.

This project will provide a facility in which retrieved and newly generated 55-gallon drums and 83-gallon overpacked drums of contact handled solid radioactive waste are inspected, assayed, and drums opened if necessary. Waste contents will be sorted and segregated if necessary, empty drums and waste compacted, repackaged, certified, and shipped to final disposal. Small newly generated boxes will be similarly treated. (Boxes will not be opened in WRAP Module 1, but in a later WRAP Module.) This document describes the Quality Assurance Program to be followed during the definitive design phase and various stages of construction.

15075 (WHC-SD-W100-TD–001) **183-H Basin Mixed Waste Analysis and Testing Report.** Westinghouse Hanford Co., Richland, WA (United States). [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010088. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this sampling and analysis report is to provide data necessary to support treatment and disposal options for the low-level mixed waste from the 183-H solar evaporation ponds. In 1973, four of the 16 flocculation and sedimentation basins were designated for use as solar evaporation basins to provide waste reduction by natural evaporation of liquid chemical wastes from the 300 Area fuel fabrication facilities. The primary purpose of this effort is to gather chemical and bulk property data for the waste in the drums/boxes of sediment removed from the basin at Central Waste Complex.

15076 (WHC-SD-W112-CSER–001) **Criticality classification of enhanced radioactive and mixed waste storage.** Boothe, G.F. Westinghouse Hanford Co., Richland, WA (United States). 6 Apr 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010103. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this document is to evaluate the criticality potential of the Enhanced Radioactive and Mixed Waste Storage Facility, Project W-112, and to demonstrate that the facility can be classified as a limited control facility in accordance with the requirements of the Nuclear Criticality Safety Manual, WHC-CM-42-9 (WHC 1994). This document also recommends reducing the extent of criticality safety training that operators in W-112 should receive and minimize the level of criticality safety design reviews and inspections commensurate with the type of activities engaged in the facility.

15077 (WHC-SD-W151-ATP–002) **Cathodic protection acceptance test procedure.** Nordquist, E.M. Westinghouse Hanford Co., Richland, WA (United States). 2 Sep 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010226. Source: OSTI; NTIS; INIS; GPO Dep.

This acceptance test procedure is to document testing of added anodes to existing Rectifier No. 11. Anodes were added under Project W-151, Tank 101-AZ Waste Retrieval System.

15078 (WHC-SD-W236A-PLN–006-Rev.2) **Plant Acquisition Plan: Multi-function Waste Tank Facility. Revision 2.** McCallum, J.R. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); ICF Kaiser Hanford Co., Richland, WA (United States). 15 Mar 1995. 55p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009092. Source: OSTI; NTIS; INIS; GPO Dep.

Provides a basis for configuring design packages for construction and procurement activities.

15079 (WHC-SD-W236A-SDRD–001-Rev.1) **Supplemental design requirements document, Multifunction Waste Tank Facility, Project W-236A. Revision 1.** Groth, B.D. Westinghouse Hanford Co., Richland, WA (United States). 11 Jan 1995. 196p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005466. Source: OSTI; NTIS; INIS; GPO Dep.

The Multi-Function Waste Tank Facility (MWTF) consists of four, nominal 1 million gallon, underground double-shell tanks, located in the 200-East area, and two tanks of the same capacity in the 200-West area. MWTF will provide environmentally safe storage capacity for wastes generated during remediation/retrieval activities of existing waste storage tanks. This document delineates in detail the information to be used for effective implementation of the Functional Design Criteria requirements.

15080 (WHC-SD-W236A-TR–001-Rev.1) **Multi-function Waste Tank Facility Qualification and Training Plan, Project W-236A.** Smith, L.K. Westinghouse Hanford Co., Richland, WA (United States). 1 Dec 1994. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010228. Source: OSTI; NTIS; INIS; GPO Dep.

The MWTF Qualification and Training Plan is being issued as a supporting document for Project W-236A. This plan sets forth the qualification and training requirements for personnel assigned to positions which have a functional impact on the Multi-Functional Waste Tank Facility (MWTF), Project W-236A. Guidance for employee training is provided in the Employee Training Policy, Rev. 0, dated August 12, 1994 and the Training Administration Manual, WHC-CM-2-15. This document contains training plans for Westinghouse Hanford Company (WHC) and ICF Kaiser Hanford Company (ICF KH). Management shall review/update the specific contents semi-annually.

15081 (WHC-SD-W320-CBA–001) **W-320 pit liner vs. coating cost risk benefit analysis.** Symons, G.A. Westinghouse Hanford Co., Richland, WA (United States). 16 Dec 1994. 89p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010077. Source: OSTI; NTIS; INIS; GPO Dep.

This report evaluates the costs and the risk trade-offs associated with the two pit lining or confinement options being considered as part of the Tank 241-C-106 Waste Retrieval Project. Both of these pit secondary confinement options (i.e., stainless steel pit liners and epoxy coating) can be implemented in a fashion that complies with criteria for secondary containment systems specified by the Washington Administration Codes (WAC-173-303-604). Direct life cycle costs of the two options including design, fabrication, installation, radiation, exposure, and decontamination and disposal costs are compared. Risk is expressed as probability weighted with the confinement consequences that could be mitigated by the pit liner. The risk impact of the choice of the confinement option is also evaluated in the context of the overall risk associated with the sluicing project and continued storage of the high-heat waste in the Tank 241-C-106 pending completion of the W-320 Project. The two

pit secondary containment options are stainless steel line and epoxy coating.

15082 (WHC-SD-W340-ECOR–001) **Project W-340 tank 241-C-106 manipulator system closeout summary.** McDaniel, L.B. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 476p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010079. Source: OSTI; NTIS; INIS; GPO Dep.

This document summarizes the work that was ongoing when Project W-340 was put on hold. Project W-340: Tank 241-C-106 Manipulator Retrieval System, was a candidate FY98 Major System Acquisition. The project was to develop, procure and deploy a Long Reach Manipulator (LRM) waste retrieval system to provide an alternate method to completing the in-tank demonstration of Single Shell Tank waste retrieval technology. The need for enhanced capabilities derives from (1) the inability of the baseline technology to retrieve certain hard waste forms; (2) uncertainty in the quantity of leakage which will be allowed. Numerous studies over the years have identified an arm architecture as a promising retrieval technology to overcome these concerns. The W340 project was intended to further develop and demonstrate this alternative, as part of selecting the best approach for all tanks. Prior to completing the effort, it was determined that an LRM system was too architecture specific and was envisioned to be too expensive for a one time demonstration of retrieval technology. At the time the work was stopped, an effort was underway to broaden the project scope to allow alternatives to an arm-based system.

15083 (WHC-SD-WM-ANAL–029) **Stress analysis of portable safety platform (Core Sampler Truck).** Ziada, H.H. Westinghouse Hanford Co., Richland, WA (United States). 30 Mar 1995. 57p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010136. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the stress analysis and evaluation of the portable platform of the rotary mode core sampler truck No. 2 (RMCST #2). The platform comprises railing, posts, deck, legs, and a portable ladder; it is restrained from lateral motion by means of two brackets added to the drill-head service platform.

15084 (WHC-SD-WM-AP–035) **Technical task plan for Acquire Commercial Technology for Retrieval.** McDaniel, L.B. Westinghouse Hanford Co., Richland, WA (United States). 7 Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010192. Source: OSTI; NTIS; INIS; GPO Dep.

Objective is to determine from industry their best approaches to retrieving waste from the Single Shell Tanks. This task plan describes the first 18 months of work; the task will be further defined as the work progresses. The retrieval is to be demonstrated on tank 241-C-106.

15085 (WHC-SD-WM-ATP–063-Rev.1) **Acceptance test procedures for rotary mode core sampling exhausters.** Robinson, J.D. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 33p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010139. Source: OSTI; NTIS; INIS; GPO Dep.

Purpose of this ATP is to provide systematic acceptance testing of two rotary mode core sampling exhausters. These exhausters will support core sampling systems three and four. The exhaust gases are monitored for radionuclides, ammonia, and total organics.

15086 (WHC-SD-WM-ATP–106) **Acceptance test procedure for the 241-SY-101 flexible receiver gamma detector system.** Aftanas, B.L. Westinghouse Hanford Co., Richland, WA (United States). Aug 1994. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005098. Source: OSTI; NTIS; INIS; GPO Dep.

This Acceptance Test Procedure is for the 241-SY-101 Flexible Receiver Gamma Detector System.

15087 (WHC-SD-WM-ATP–124) **Nitrogen chiller acceptance test procedure.** Kostelnik, A.J. Westinghouse Hanford Co., Richland, WA (United States). 7 Mar 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008881. Source: OSTI; NTIS; INIS; GPO Dep.

This document includes the inspection and testing requirements for the Nitrogen Chiller unit. The Chiller will support the Rotary Mode core Sampling System during the summer. The Chiller cools the Nitrogen Purge Gas that is used when drilling in tank wastes to cool the drill bit.

15088 (WHC-SD-WM-ATP–127) **Acceptance test procedure for the ultra high pressure bore head for use in the self-installing liquid observation well.** Hertelendy, N.A. Westinghouse Hanford Co., Richland, WA (United States). 6 Apr 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010140. Source: OSTI; NTIS; INIS; GPO Dep.

In order to monitor waste stored in single-shell tanks, liquid observation wells (LOWs) are installed to permit periodic insertion of instrumentation probes to evaluate the waste cross sections. An ultra high pressure water bore head, developed for installing instrument trees, was adapted for use with the LOWs. The modification facilitates the removal of the high pressure water feed system after installation. This document describes a series of tests that ensures that the design meets all the functional requirements.

15089 (WHC-SD-WM-ATR–094) **Acceptance Test Report for 241-SY Pump Cradle Hydraulic System.** Koons, B.M. Westinghouse Hanford Co., Richland, WA (United States). 8 Mar 1995. 50p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009095. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this ATP is to verify that hydraulic system/cylinder procured to replace the cable/winch system on the 101-SY Mitigation Pump cradle assembly fulfills its functional requirements for raising and lowering the cradle assembly between 70 and 90 degrees, both with and without pump. A system design review was performed on the 101-SY Cradle Hydraulic System by the vendor before shipping (See WHC-SD-WM-DRR-045, 241-SY-101 Cradle Hydraulic System Design Review). The scope of this plan focuses on verification of the systems ability to rotate the cradle assembly and any load through the required range of motion.

15090 (WHC-SD-WM-CGA–001) **Video Graphic Recorder (VGR) calibration.** Akers, J.C. Westinghouse Hanford Co., Richland, WA (United States). 30 Mar 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010137. Source: OSTI; NTIS; INIS; GPO Dep.

This document outlines a calibration procedure for the Video Graphic Recorder (VGR) on the Rotary Mode Core Sample Trucks (RMCST) three and four. Intent is to use this document to check/calibrate the VGR until a calibration procedure can be created by Tank Waste Remediation System personnel.

15091 (WHC-SD-WM-CMD–002) **Closed out tank 241-SY-101 DACS system change requests No. 101-200.** Gauck, G.J. Westinghouse Hanford Co., Richland, WA (United States). 21 Feb 1995. 155p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008838. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a record closed out System Change Request No. 101-200 used during the development of the 241-SY-101 Hydrogen Mitigation Project Data Acquisition Control System.

15092 (WHC-SD-WM-CMD–003) **Closed out tank 241-SY-101 DACS system change requests No. 201-300.** Gauck, G.J. Westinghouse Hanford Co., Richland, WA (United States). 21 Feb 1995. 228p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008834. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides a record of closed out System Change Requests No. 201-300 used during the development of the 241-SY-101 Hydrogen Mitigation Project Data Acquisition Control System.

15093 (WHC-SD-WM-DA–183) **Compressed air piping, 241-SY-101 hydraulic pump retrieval trailer.** Wilson, T.R. Westinghouse Hanford Co., Richland, WA (United States). 12 Dec 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC06-87RL10930. Order Number DE95005097. Source: OSTI; NTIS; INIS; GPO Dep.

The following Design Analysis was prepared by the Westinghouse Hanford Company to determine pressure losses in the compressed air piping installed on the hydraulic trailer for the 241-SY-101 pump retrieval mission.

15094 (WHC-SD-WM-DP–079) **216-Day report for Tank 241-C-111, cores 58 and 59.** Rice, A.D. Westinghouse Hanford Co., Richland, WA (United States). 5 Dec 1994. 405p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005412. Source: OSTI; NTIS; INIS; GPO Dep.

Three core samples from tank C-111, and a field blank, were received by the 222-S laboratories. Cores 58, 59, and the field blank were analyzed in accordance with plans. A hot cell blank was analyzed at the direction of the hot cell chemist. No sample results exceeded the notification limits. Core 60 was not analyzed.

15095 (WHC-SD-WM-DP–098) **45-Day safety screening report for grab samples from Tank 241-AP-107.** Miller, G.L. Westinghouse Hanford Co., Richland, WA (United States). 8 Mar 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009147. Source: OSTI; NTIS; INIS; GPO Dep.

Three samples; 107-AP-1C, 107-AP-2c and 107-AP-3C; were received at 222-S Laboratory for analysis of DSC, TGA and visual appearance. Four additional samples; 107-AP-1D, 107-AP-2D, 107-AP-3D and 107-AP-6; were received for visual appearance only. No results exceeded the safety screen notification criteria. This report compiles the analytical results. Tank 241-AP-107 is a double-shell tank which is not on any of the four Watch Lists.

15096 (WHC-SD-WM-DP–099) **45-Day safety screen results for Tank 241-C-103, Cores 63 and 66.** Bell, K.E. Westinghouse Hanford Co., Richland, WA (United States). 23 Mar 1995. 132p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010043. Source: OSTI; NTIS; INIS; GPO Dep.

Two core samples from tank C-103, obtained by the push-mode core sampling method, were received, extruded, and analyzed by the 222-S Laboratories in accordance with References 2 (core 63) or 3 (core 66). Drainable liquids were analyzed at the segment level for a separable organic layer, energetics by DSC, and percent water by TGA. Sludge samples were analyzed at the half-segment level by DSC, TGA, and for total alpha. Notification limits were exceeded for the following: (1) presence of a separable organic layer in the drainable liquid of segment 1, cores 63 and 64, and segment 2 of core 63; (2) DSC exotherm greater than 481 J/g on the lower half of segment 3 and drainable liquid of segment 4 of core 63; and (3) percent water less than 17% on the upper half of segment 4 of core 63.

15097 (WHC-SD-WM-DP–101) **45-Day Safety Screen results for Tank 241-TY-104, Auger Samples, 95-AUG-008 and 95-AUG-009.** Miller, G.L. Westinghouse Hanford Co., Richland, WA (United States). 6 Apr 1995. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010193. Source: OSTI; NTIS; INIS; GPO Dep.

The two auger samples were collected from single-shell tank 241-TY-104 on February 28, 1995, and were analyzed by the 222-S Laboratory in accordance with the tank characterization plan. The results for those primary analytes (differential scanning calorimetry, thermogravimetry, total alpha radioactivity, and total organic carbon) indicate that no safety screening notification limits were exceeded.

15098 (WHC-SD-WM-EE–004-Rev.1) **Performance assessment of grouted double-shell tank waste disposal at Hanford. Revision 1.** Shade, J.W., Kincaid, C.T. (Pacific Northwest Lab., Richland, WA (United States)); Whyatt, G.A.; Rhoads, K.; Westsik, J.H. Jr.; Freshley, M.D.; Blanchard, K.A.; Shade, J.W.; Piepho, M.G.; Voogd, J.A. Westinghouse Hanford Co., Richland, WA (United States). Sep 1994. 1,201p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008432. Source: OSTI; NTIS; INIS; GPO Dep.

This document assesses the performance of the Grout Disposal Facility after closure. The facility and disposal environment are modeled to predict the long-term impacts of the disposal action. The document concludes that the disposal system provides reasonable assurance that doses to the public will remain within the performance objectives. This document is required for DOC Order 5820.2A.

15099 (WHC-SD-WM-ER–394) **Buckling of the Tank 241SY101 primary liner.** Marlow, R.S. Westinghouse Hanford Co., Richland, WA (United States). 19 Dec 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010229. Source: OSTI; NTIS; INIS; GPO Dep.

This document describes the computation of the buckling pressure of the primary liner of Tank 241SY101. It describes the calculation of the negative gauge pressure required to buckle the liner. A negative pressure may develop inside the tank when water is sprayed on the hydrogen mitigation pump during its removal. Calculations indicate that the liner will buckle at 23,442 Pa, or 239 cm of water.

15100 (WHC-SD-WM-ER–417) **Sampler bias – Phase 1.** Blanchard, R.J. Westinghouse Hanford Co., Richland, WA (United States). 7 Mar 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008884. Source: OSTI; NTIS; INIS; GPO Dep.

This documents Phase 1 determinations on sampler induced bias for four sampler types used in tank characterization. Each sampler, grab sampler or bottle-on-a-string, auger sampler, sludge sampler and universal sampler, is briefly discussed and their physical limits noted. Phase 2 of this document will define additional testing and analysis to further define Sampler Bias.

15101 (WHC-SD-WM-ER–431) **Core sampling system spare parts assessment.** Walter, E.J. Westinghouse Hanford Co., Richland, WA (United States). 4 Apr 1995. 45p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010135. Source: OSTI; NTIS; INIS; GPO Dep.

Soon, there will be 4 independent core sampling systems obtaining samples from the underground tanks. It is desirable that these systems be available for sampling during the next 2 years. This assessment was prepared to evaluate the adequacy of the spare parts identified for the core sampling system and to provide recommendations that may remediate overages or inadequacies of spare parts.

15102 (WHC-SD-WM-ES–333) **Clean salt disposition options.** Herting, D.L. (International Technology Corp., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); International Technology Corp., Richland, WA (United States). 29 Mar 1995. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010142. Source: OSTI; NTIS; INIS; GPO Dep.

The proposed waste treatment scheme known as the "Clean Salt Process" would make it possible to extract sodium salts of very low specific activity from Hanford's low level waste currently stored in underground single shell and double shell tanks. This document explores the regulations applicable to a number of disposition options for the recovered sodium salts. The current (baseline) plan is to vitrify the unrecovered sodium salts along with the low level waste from the tanks. Several options are available for disposition of the recovered salts, at far less cost. These options range from beneficial re-use or recycle of the recovered salts to disposal of the recovered salts as mixed waste at an on-site disposal facility. Federal and state regulations governing each disposition option are presented.

15103 (WHC-SD-WM-ETP–058) **Engineering task plan for BX/BY compressor upgrade.** Strand, R.G. Westinghouse Hanford Co., Richland, WA (United States). 7 Feb 1995. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007792. Source: OSTI; NTIS; INIS; GPO Dep.

This Engineering Task Plan outlines the remaining work to be completed for the BX/BY Instrument Air upgrade. Initial work efforts

were guided by Engineering Work Plan, "BX-BY Compressor Upgrade" dated 1-25-93 (see Attachment A) which is provided for information. The overall engineering task is to provide a permanent replacement for the instrument air supply system for the 241-BX/BY Tank Farms. The existing system consists of a 25 horsepower Worthington non-lube compressor and an Oriad air dryer. The existing equipment is dated, requires high maintenance and is located in a contaminated zone making it unusable. The BX/BY instrument air replacement unit will be one of the 100 SCFM generic air stations. This station will be permanently sited with the addition of drawing changes to provide a concrete foundation, air piping to existing lines and electrical power supply tie-ins.

15104 (WHC-SD-WM-ETP–137) **Recommended test program to determine crack growth rate in double-shell tank materials.** Blackburn, L.D. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 10p. DOE Contract AC06-87RL10930. Order Number DE95009098. Source: OSTI; NTIS; INIS; GPO Dep.

This document presents the technical rationale and requirements for an experimental program to determine the stress corrosion crack growth rate in double-shell tank materials.

15105 (WHC-SD-WM-ETP–146) **Engineering Task Plan: PUREX cathodic protection system survey and maintenance.** Brezler, T.A. Westinghouse Hanford Co., Richland, WA (United States). 23 Mar 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010049. Source: OSTI; NTIS; INIS; GPO Dep.

Cathodic Protection (CP) was installed on underground transfer lines at the PUREX facility by project B-234 by EBASCO Services Incorporated in 1986. The major components of the CP system are rectifier 02, a series of underground anodes, test stations and reference electrodes buried close to the protected piping. Tank Waste Remediation System (TWRS) Materials and Corrosion Engineering (M&CE) was asked by PUREX to assume responsibility for surveying and maintaining PUREX's CP system. The effectiveness of CP will remain so if properly maintained, which requires periodic measurements and timely corrective action when the measurements show loss of CP. If the system is not well maintained, corrosion failures will eventually occur on the piping protected by the CP system. This engineering task plan establishes an agreement between PUREX and TWRS M&CE to ensure proper operation of the CP system and adherence to the Washington Administrative Codes (WAC).

15106 (WHC-SD-WM-ETP–148) **Engineering Task Plan for inspection of double shell tank farm exhaust ducts.** Nelson, O.D. Westinghouse Hanford Co., Richland, WA (United States). 27 Mar 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010058. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the scope and tasks required to determine the integrity of selected double shell tank exhaust ducts.

15107 (WHC-SD-WM-ISB–003) **340 Waste Handling Facility interim safety basis.** Bendixsen, R.B. Westinghouse Hanford Co., Richland, WA (United States). 3 Apr 1995. 126p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010041. Source: OSTI; NTIS; INIS; GPO Dep.

This document establishes the interim safety basis (ISB) for the 340 Waste Handling Facility (340 Facility). An ISB is a documented safety basis that provides a justification for the continued operation of the facility until an upgraded final safety analysis report is prepared that complies with US Department of Energy (DOE) Order 5480.23, Nuclear Safety Analysis Reports. The ISB for the 340 Facility documents the current design and operation of the facility. The 340 Facility ISB (ISB-003) is based on a facility walkdown and review of the design and operation of the facility, as described in the existing safety documentation. The safety documents reviewed, to develop ISB-003, include the following: OSD-SW-153-0001, Operating Specification Document for the 340 Waste Handling Facility (WHC 1990); OSR-SW-152-00003, Operating Limits for the 340 Waste Handling Facility (WHC 1989); SD-RE-SAP-013, Safety Analysis Report for Packaging, Railroad Liquid Waste Tank Cars (Mercado 1993); SD-WM-TM-001, Safety Assessment Document for the 340 Waste Handling Facility (Berneski 1994a); SD-WM-SEL-016, 340 Facility Safety Equipment List (Berneski 1992); and 340 Complex Fire Hazard Analysis, Draft (Hughes Assoc. Inc. 1994).

15108 (WHC-SD-WM-OTR–148) **Operability Test Report for 241-T compressed air system and heat pump.** Freeman, R.D. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 37p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010072. Source: OSTI; NTIS; INIS; GPO Dep.

This Operability Test Report (OTR) documents the results of functional testing performed on the operating parameters of the 241-T-701 Compressed Air System. The System was successfully installed and tested per work package 2W-92-01172.

15109 (WHC-SD-WM-OTR–151) **Operability Test Report for 241-U Compressed Air System and heat pump.** Rensink, G.E. Westinghouse Hanford Co., Richland, WA (United States). 28 Mar 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010141. Source: OSTI; NTIS; INIS; GPO Dep.

The 241-U-701 compressed air system supplies instrument quality compressed air to Tank Farm 241-U. The system was upgraded. The operability test showed that the system operates within its intended design parameters. System performance was monitored, recorded, and used to identify areas of concern. Exceptions to the OTP and additional items for safe system performance were minimal and have been resolved; the air system is ready for Operation's use.

15110 (WHC-SD-WM-PLN–091) **Tank Waste Remediation System Tank Waste Analysis Plan. FY 1995.** Haller, C.S.; Dove, T.H. Westinghouse Hanford Co., Richland, WA (United States). 1 Nov 1994. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010086. Source: OSTI; NTIS; INIS; GPO Dep.

This documents lays the groundwork for preparing the implementing the TWRS tank waste analysis planning and reporting for Fiscal Year 1995. This Tank Waste Characterization Plan meets the requirements specified in the Hanford Federal Facility Agreement and Consent Order, better known as the Tri-Party Agreement.

15111 (WHC-SD-WM-PROC–014) **KW basin backwash pit sludge measurement/video.** Dodd, E.N. Jr. Westinghouse Hanford Co., Richland, WA (United States). 6 Sep 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010083. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this procedure is to gather visual and depth information and monitor underwater activities in the 105-KW SFBWP and transfer channel. Profile lighting (the use of lighting and shadows to show the surface contour) will be used to assess the contour of the sludge surface. Select measurements will also be taken to determine the actual sludge depth. The control/video station will be setup outside the radiation area or in lowest possible exposure area to reduce personnel exposure (ALARA). This procedure is to provide a mechanism to assist in fully characterizing the volume and surface topology of the sludge currently deposited in the sandfilter backwash pit (SFBWP). Surveillance Systems Engineering (SSE) personnel will gather visual information utilizing a closed circuit television (CCTV) color camera, mounted to stainless steel extension poles. Connections allow the camera to be connected with a pan and tilt to allow better positioning capabilities and to get good landscape profiling of the sediment surface. The information will be videotaped to a one-half inch NTSC or Y/C format. Underwater lighting will be accomplished by means of 500 watt underwater lamps.

15112 (WHC-SD-WM-PROC–018) **Assembly procedure for column cutting platform.** Routh, R.D. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009150. Source: OSTI; NTIS; INIS; GPO Dep.

This supporting document describes the assembly procedure for the Column Cutting Platform and Elevation Support. The Column

Cutting Platform is a component of the 241-SY-101 Equipment Removal System. It is set up on the deck of the Strongback Trailer to provide work access to cut off the upper portion of the Mitigation Pump Assembly (MPA). The Elevation Support provides support for the front of the Storage Container with the Strongback at an inclined position. The upper portion of the MPA must be cut off to install the Containment Caps on the Storage Container. The storage Container must be maintained in an inclined position until the Containment Caps are installed to prevent any residual liquids from migrating forward in the Storage Container.

15113 (WHC-SD-WM-QAPP–018-Rev.1) **Tank Waste Project Quality Assurance Program Plan. Revision 1.** Clayton, R.E. Westinghouse Hanford Co., Richland, WA (United States). 20 Nov 1994. 40p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010084. Source: OSTI; NTIS; INIS; GPO Dep.

This plan describes all the Quality Assurance Program elements required by DOE Order 5700.6C. The elements shall be applied as applicable to specific Tank Waste Projects. A project-specific QAPP shall be issued as a supporting document which shall be used in conjunction with this QAPP. The project specific QAPP shall describe or define any special information, instructions or requirements.

15114 (WHC-SD-WM-RPT–102) **RMCS exhauster data logger configuration.** Waldo, E.J. Westinghouse Hanford Co., Richland, WA (United States). 5 Dec 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010087. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the configuration of the Chessell Model 4200 Data Logger used in the Rotary Mode Core Sampling (RMCS) Exhauster.

15115 (WHC-SD-WM-RPT–118) **Vault 102 cemented waste solidification testing system. Final report.** Kruger, A.A. Westinghouse Hanford Co., Richland, WA (United States). 10 Mar 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009156. Source: OSTI; NTIS; INIS; GPO Dep.

This final report presents a summary of all work completed in support of the ultrasonic nondestructive testing of grouted radioactive waste, along with the status of all uncompleted tasks. Tasks were left uncompleted because of the cancellation of the Hanford Grout Disposal Program. Much of the work summarized in this report has been reported on in previous submittals, but is summarized here to provide a more complete understanding of the final status of the overall project.

15116 (WHC-SD-WM-SARR–034) **Safety evaluation for the interim stabilization of Tank 241-C-103.** Geschke, G.R. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 121p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009155. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the basis for interim stabilization of tank 241-C-103. The document covers the removal of the organic liquid layer and the aqueous supernatant from tank 241-C-103. Hazards are identified, consequences are calculated and controls to mitigate or prevent potential accidents are developed.

15117 (WHC-SD-WM-SDRR–001) **Compilation of formal comments on the tank farms interim hazard and accident analyses.** Ryan, G.W. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 334p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010080. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a compilation of the formal comments on the Tank Farms Interim Hazard and Accident Analyses. This document contains the RCR's that were received and subsequently resolved to develop Rev. A of WHC-SD-WM-SAR-065, Interim Chapter 3.0 Hazard and Accident Analysis.

15118 (WHC-SD-WM-TA–160) **TWRS tank waste pretreatment process development hot test siting report.** Howden, G.F. (Westinghouse Hanford Co., Richland, WA (United States)); Banning, D.L.; Dodd, D.A.; Smith, D.A.; Stevens, P.F.; Hansen, R.I.; Reynolds, B.A. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 223p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009100. Source: OSTI; NTIS; INIS; GPO Dep.

This report is the sixth in a series that have assessed the hot testing requirements for TWRS pretreatment process development and identified the hot testing support requirements. This report, based on the previous work, identifies specific hot test work packages, matches those packages to specific hot cell facilities, and provides recommendations of specific facilities to be employed for the pretreatment hot test work. Also identified are serious limitations in the tank waste sample retrieval and handling infrastructure. Recommendations are provided for staged development of 500 mL, 3 L, 25 L and 4000 L sample recovery systems and specific actions to provide those capabilities.

15119 (WHC-SD-WM-TP–259-Rev.1) **Tank 241-C-105 tank characterization plan. Revision 1.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). 25 Jan 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008883. Source: OSTI; NTIS; INIS; GPO Dep.

The Defense Nuclear Facilities Safety Board has advised the DOE to concentrate the near-term sampling and analysis activities on identification and resolution of safety issues. The data quality objective (DQO) process was chosen as a tool to be used to identify the sampling and analytical needs for the resolution of safety issues. Tank C-105 was on the Higher Heat Load Watch List. However, it is presently classified as a non-Watch List low heat load tank and is monitored weekly. This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, and WHC 222-S Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples from Tank 241-C-105.

15120 (WHC-SD-WM-TP–289) **Tank 241-U-105 tank characterization plan.** Homi, C.S. Westinghouse Hanford Co., Richland, WA (United States). 3 Feb 1995. 36p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007793. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, Oak Ridge National Laboratory, and PNL tank vapor program. The scope of this plan is to provide guidance for the sampling and analysis of vapor samples from tank 241-U-105.

15121 (WHC-SD-WM-TP–299) **Tank 241-TY-101 Tank Characterization Plan.** Homi, C.S. Westinghouse Hanford Co., Richland, WA (United States). 20 Mar 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010085. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, Oak Ridge National Laboratory, and PNL tank vapor program. The scope of this plan is to provide guidance for the sampling and analysis of vapor samples from tank 241-TY-101.

15122 (WHC-SD-WM-TP–300) **Tank 241-TY-103 Tank Characterization Plan.** Homi, C.S. Westinghouse Hanford Co., Richland, WA (United States). 16 Mar 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010071. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, Oak Ridge National Laboratory, and PNL tank vapor program. The scope of this plan is to provide guidance for the sampling and analysis of vapor samples from tank 241-TY-103.

15123 (WHC-SD-WM-TP–308) **Tank 241-U-201 tank characterization plan.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). 21 Feb 1995. 32p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008416. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, and WHC 22-S Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples for tank 241-U-201.

15124 (WHC-SD-WM-TP–309) **Tank 241-U-202 tank characterization plan.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). 21 Feb 1995. 32p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008415. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, and WHC 222-S Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples for tank 241-U-202.

15125 (WHC-SD-WM-TP–310) **Tank 241-U-203: Tank Characterization Plan.** Sathyanarayana, P. (Westinghouse Hanford Co., Richland, WA (United States)). Westinghouse Hanford Co., Richland, WA (United States); Los Alamos Technical Associates, Inc., Kennewick, WA (United States). 27 Mar 1995. 38p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010138. Source: OSTI; NTIS; INIS; GPO Dep.

The revised Federal Facility Agreement and Consent Order states that a tank characterization plan will be developed for each double-shell tank and single-shell tank using the data quality objective process. The plans are intended to allow users and regulators to ensure their needs will be met and resources are devoted to gaining only necessary information. This document satisfies that requirement for Tank 241-U-203 sampling activities.

15126 (WHC-SD-WM-TP–330) **Compatibility Grab Sampling and Analysis Plan.** Schreiber, R.D. Westinghouse Hanford Co., Richland, WA (United States). 10 Apr 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010807. Source: OSTI; NTIS; INIS; GPO Dep.

This document is a plan which serves as the contractual agreement between the Characterization Program, Sampling Operations, and WHC 222-S Laboratory. The scope of this plan is to provide guidance for the sampling and analysis of samples for the purpose of compatibility.

15127 (WHC-SD-WM-WP–132-Rev.5) **Tank Farm Instrumentation and Data Acquisition/Management Upgrade Plan. Revision 5.** Scaief, C.C. III. Westinghouse Hanford Co., Richland, WA (United States). 27 Mar 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010059. Source: OSTI; NTIS; INIS; GPO Dep.

This plan provides the strategy, implementation, and schedule for upgrading tank farm instrumentation, data acquisition and data management. The focus is on surveillance parameters to verify and maintain tank safety. The criteria do not necessarily constitute mandatory requirements but are based upon engineering judgment and best available information. Schedules reflect current funding for FY95. For out years they are best engineering judgment.

15128 (WHC-SP–1143) **Tank waste remediation system high-level waste feed processability assessment report.** Lambert, S.L. (Westinghouse Hanford Co., Richland, WA (United States)); Kim, D.S. Westinghouse Hanford Co., Richland, WA (United States). Dec 1994. 279p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008029. Source: OSTI; NTIS; INIS; GPO Dep.

This study evaluates the effect of feed composition on the performance of the high-level vitrification process. It is assumed in this study that the tank wastes are retrieved and blended by tank farms, producing 12 different blends from the single-shell tank farms, two blends of double-shell tank waste, and a separately defined all-tank blend. This blending scenario was chosen only for evaluating the impact of composition on the volume of high- level waste glass produced. Special glass compositions were formulated for each waste blend based on glass property models and the properties of similar glasses. These glasses were formulated to meet the applicable viscosity, electrical conductivity, and liquidus temperature constraints for the identified candidate melters. Candidate melters in this study include the low-temperature stirred melter, which operates at 1050°C; the reference Hanford Waste Vitrification Plant liquid-fed ceramic melter, which operates at 1150°C; and the high-temperature, joule-heated melter and the cold-crucible melter, which operate over a temperature range of 1150°C to 1400°C. In the most conservative case, it is estimated that 61,000 MT of glass will be produced if the Site's high-level wastes are retrieved by tank farms and processed in the reference joule-heated melter. If an all-tank blend was processed under the same conditions, the reference melter would produce 21,250 MT of glass. If cross-tank blending were used, it is anticipated that $2.0 billion could be saved in repository disposal costs (based on an average disposal cost of $217,000 per canister) by blending the S, SX, B, and T Tank Farm wastes with other wastes prior to vitrification. General blending among all the tank farms is expected to produce great potential benefit.

15129 (WSRC-MS–94-0604) **Resistance Weld Qualifcation Analysis for Radioactive Waste Canisters.** Gupta, N.K.; Gong, C. Westinghouse Savannah River Co., Aiken, SC (United States). 10 Jan 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950740–6: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95060079. Source: OSTI; NTIS; INIS; GPO Dep.

High level radioactive waste canisters are sealed by resistance upset welding to ensure leak tight closures. Resistance welding is fast, uniform, and can be performed remotely to minimize radiation exposure to the operators. Canisters are constructed in accordance with ASME Band PV Code, Section VIII, Division 1, however, the resistance welds are not used in Section VIII. The resistance welds are qualified by analysis using material properties obtained from the test coupons. Burst tests are performed on canister welds to meet ASME Section IX welder qualification requirements. Since burst tests are not used in Section IX for resistance weld qualification, finite element results of canister resistance welds are compared with the finite element analysis results of resistance weld tests in ASME Section IX, QW-196 to establish similarity between the two weld tests. Detailed analyses show that the primary mode of failure in both the tests is shear and, therefore, the use of burst test in place of shear test is acceptable. It is believed that the detailed analyses and results could help in establishing acceptance criteria for resistance upset welding in ASME B&PV Code, Sections VIII, and IX.

15130 (WTD–92-046) **Waste management facilities cost information estimating data.** Feizollahi, F. (Morrison-Knudsen Corp., Boise, ID (United States). Environmental Services Div.); Shropshire, D. EG and G Idaho, Inc., Idaho Falls, ID (United States); Morrison-Knudsen Corp., Boise, ID (United States). Environmental Services Div. Oct 1992. 319p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95009462. Source: OSTI; NTIS; INIS; GPO Dep.

This report contains cost estimating support data for the Waste Management Facility Cost Information (WMFCI) task. The WMFCI task was commissioned by the U.S. Department of Energy (DOE) to develop planning level life-cycle cost (PLCC) estimates for treatment, storage, and disposal facilities. The report contains PLCC estimates versus capacity for 26 different facility cost modules. Estimates in the report apply to five distinctive waste streams: low-level waste, low-level mixed waste, alpha contaminated low-level waste, alpha contaminated low-level mixed waste, and transuranic waste. The report addresses five different treatment types: incineration, metal/melting and recovery, shredder/compaction, solidification, and vitrification.

15131 (Y/EN–5289/V4) **Final report from VFL Technologies for the pilot-scale thermal treatment of lower East Fork Poplar Creek floodplain soils. LEFPC appendices, Volume 4, Appendix V-C.** Oak Ridge National Lab., TN (United States). Sep 1994. 402p. Sponsored by USDOE, Washington, DC (United States).

DOE Contract AC05-84OR21400. Order Number DE95009188. Source: OSTI; NTIS; GPO Dep.

This is the the final verification run data package for pilot scale thermal treatment of lower East Fork Poplar Creek floodplain soils. Included are data on volatiles, semivolatiles, and TCLP volatiles.

15132 (YJT–94-16) **Validation of a numerical release model (REPCOM) for the finnish operating waste disposal systems. Part VI: Intermediate results from the laboratory measurements 1986-1993.** Olin, M. (VTT Chemical Technology, Espoo (Finland)). Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Sep 1994. 38p. Order Number DE95627053. Source: OSTI; NTIS; INIS.

In Finland the operating waste from four nuclear power plant units will be disposed of in two repositories to be built in the granitic bedrock at the two power plant sites. The aim of this work is to model experimentally the inner structures and materials of the reactor waste repositories and to use the results for the validation of a numerical near field release model, REPCOM. The laboratory arrangements included the following test materials: bitumenized and cemented ion-exchange resin, concrete, crushed rock, and water corresponding to materials in the existing and planned disposal systems. ^{137}Cs, ^{60}Co, ^{85}Sr, and ^{90}Sr were used as tracers, with which the ion-exchange resin, water or crushed rock was labelled depending on the specimen type. (7 refs., 43 figs.).

15133 (YJT–94-21) **Application of the RES methodology for identifying features, events and processes (FEPs) for near-field analysis of copper-steel canister.** Vieno, T. (VTT Energy, Espoo (Finland)); Hautojaervi, A.; Raiko, H.; Ahonen, L.; Salo, J.P. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Dec 1994. 41p. Order Number DE95627054. Source: OSTI; NTIS; INIS.

Rock Engineering Systems (RES) is an approach to discover the important characteristics and interactions of a complex problem. Recently RES has been applied to identify features, events and processes (FEPs) for performance analysis of nuclear waste repositories. The RES methodology was applied to identify FEPs for the near-field analysis of the copper-steel canister for spent fuel disposal. The aims of the exercise were to learn and test the RES methodology and, secondly, to find out how much the results differ when RES is applied by two different groups on the same problem. A similar exercise was previously carried out by a SKB group. A total of 90 potentially significant FEPs were identified. The exercise showed that the RES methodology is a practicable tool to get a comprehensive and transparent picture of a complex problem. The approach is easy to learn and use. It reveals the important characteristics and interactions and organizes them in a format easy to understand. (9 refs., 5 figs., 3 tabs.).

15134 (YJT–94-22) **Literature study on the microstructure of bentonite and its effect on diffusion.** Muurinen, A. (VTT Chemical Technology, Espoo (Finland)); Lehikoinen, J.; Pusch, R. Nuclear Waste Commission of Finnish Power Companies, Helsinki (Finland). Dec 1994. 96p. Order Number DE95627055. Source: OSTI; NTIS; INIS.

In the study the available information from the literature on the microstructural properties of bentonite and its main component montmorillonite have been compiled, together with different phenomena which have been found to participate in the diffusion process in bentonite. (167 refs., 36 figs., 6 tabs.).

15135 (Y/SUB–94-99069C/Y15/11) **Underground storage tank management plan.** Oak Ridge Y-12 Plant, TN (United States); Science Applications International Corp., Oak Ridge, TN (United States). Sep 1994. 414p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009520. Source: OSTI; NTIS; INIS; GPO Dep.

The Underground Storage Tank (UST) Management Program at the Oak Ridge Y-12 Plant was established to locate UST systems in operation at the facility, to ensure that all operating UST systems are free of leaks, and to establish a program for the removal of unnecessary UST systems and upgrade of UST systems that continue to be needed. The program implements an integrated approach to the management of UST systems, with each system evaluated against the same requirements and regulations. A common approach is employed, in accordance with Tennessee Department of Environment and Conservation (TDEC) regulations and guidance, when corrective action is mandated. This Management Plan outlines the compliance issues that must be addressed by the UST Management Program, reviews the current UST inventory and compliance approach, and presents the status and planned activities associated with each UST system. The UST Management Plan provides guidance for implementing TDEC regulations and guidelines for petroleum UST systems. (There are no underground radioactive waste UST systems located at Y-12.) The plan is divided into four major sections: (1) regulatory requirements, (2) implementation requirements, (3) Y-12 Plant UST Program inventory sites, and (4) UST waste management practices. These sections describe in detail the applicable regulatory drivers, the UST sites addressed under the Management Program, and the procedures and guidance used for compliance with applicable regulations.

15136 (Y/SUB–94-EAQ10C/2/P2) **Calendar year 1993 groundwater quality report for the Upper East Fork Poplar Creek hydrogeologic regime Y-12 Plant, Oak Ridge, Tennessee: 1993 groundwater quality data interpretations and proposed program modifications.** Oak Ridge National Lab., TN (United States). Oct 1994. 176p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009199. Source: OSTI; NTIS; INIS; GPO Dep.

This Groundwater Quality Report (GWQR) contains an evaluation of the groundwater quality data obtained during the 1993 calendar year (CY) at the U.S. Department of Energy (DOE) Y-12 Plant located on the DOE Oak Ridge Reservation (ORR) southeast of Oak Ridge, Tennessee (Figure 1). The groundwater quality data are presented in Part 1 of the GWQR submitted by Martin Marietta Energy Systems, Inc. (Energy Systems) to the Tennessee Department of Environment and Conservation (TDEC) in February 1994 (HSW Environmental Consultants, Inc. 1994a). Groundwater quality data evaluated in this report were obtained at several hazardous and non-hazardous waste management facilities and underground storage tanks (USTS) located within the Upper East Fork Poplar Creek Hydrogeologic Regime (East Fork Regime). The Environmental Management Department of the Y-12 Plant Health, Safety, Environment, and Accountability Organization manages the groundwater monitoring activities in each regime under the auspices of the Y-12 Plant Groundwater Protection Program (GWPP). The purpose of the GWPP is to characterize the hydrogeology and to monitor groundwater quality at the Y-12 Plant and surrounding area to provide for protection of groundwater resources consistent with federal, state, and local requirements and in accordance with DOE Orders and Energy Systems corporate policy. The annual GWQR for the East Fork Regime is completed in two parts. Part 1 consists primarily of data appendices and serves as a reference for the groundwater quality data obtained each CY under the lead of the Y-12 Plant GWPP. Part 2 (this report) contains an evaluation of the data with respect to regime-wide groundwater quality, presents the findings and status of ongoing hydrogeologic studies, describes changes in monitoring priorities, and presents planned modifications to the groundwater sampling and analysis program for the following calendar year.

15137 (Y/SUB/WM–213) **Construction quality assurance report for the Y-12 Construction/Demolition Landfill VII (CDL VII), Oak Ridge, Tennessee.** Burton, P.M. (Burns and McConnel Waste Consultants, Inc., Overland Park, KS (United States)). Oak Ridge Y-12 Plant, TN (United States); Burns and McConnel Waste Consultants, Inc., Overland Park, KS (United States). Nov 1994. 168p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-90OR21860 ; AC05-84OR21400. Order Number DE95009186. Source: OSTI; NTIS; INIS; GPO Dep.

This Construction Quality Assurance (CQA) Report provides documentation that Bid Option 2 of the Y-12 Plant Construction Demolition Landfill 7 (CDL-7) was constructed in substantial compliance with the Tennessee Department of Environment and Conservation (TDEC) approved design, as indicated and specified in the permit drawings, approved changes, and specifications. CDL-7 is located in Anderson County on the south side of Chestnut Ridge, approximately 0.5 miles south of the Y-12 Plant in Oak Ridge, Tennessee. This report applies specifically to the limits of

excavation for Area No. 1 portions of the perimeter maintenance road and drainage channel and Sedimentation Pond No. 3. A partial "As-Built" survey was performed and is included.

15138 (Y/TS–1022) **Evaluation of cavity occurrence in the Maynardville Limestone and the Copper Ridge Dolomite at the Y-12 Plant using logistic and general linear models.** Shevenell, L.A. (Univ. of Nevada, Reno, NV (United States). Nevada Bureau of Mines and Geology); Beauchamp, J.J. Oak Ridge National Lab., TN (United States). Nov 1994. 52p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009057. Source: OSTI; NTIS; GPO Dep.

Several waste disposal sites are located on or adjacent to the karstic Maynardville Limestone (Cmn) and the Copper Ridge Dolomite (Ccr) at the Oak Ridge Y-12 Plant. These formations receive contaminants in groundwaters from nearby disposal sites, which can be transported quite rapidly due to the karst flow system. In order to evaluate transport processes through the karst aquifer, the solutional aspects of the formations must be characterized. As one component of this characterization effort, statistical analyses were conducted on the data related to cavities in order to determine if a suitable model could be identified that is capable of predicting the probability of cavity size or distribution in locations for which drilling data are not available. Existing data on the locations (East, North coordinates), depths (and elevations), and sizes of known conduits and other water zones were used in the analyses. Two different models were constructed in the attempt to predict the distribution of cavities in the vicinity of the Y-12 Plant: General Linear Models (GLM), and Logistic Regression Models (LOG). Each of the models attempted was very sensitive to the data set used. Models based on subsets of the full data set were found to do an inadequate job of predicting the behavior of the full data set. The fact that the Ccr and Cmn data sets differ significantly is not surprising considering the hydrogeology of the two formations differs. Flow in the Cmn is generally at elevations between 600 and 950 ft and is dominantly strike parallel through submerged, partially mud-filled cavities with sizes up to 40 ft, but more typically less than 5 ft. Recognized flow in the Ccr is generally above 950 ft elevation, with flow both parallel and perpendicular to geologic strike through conduits, which tend to be large than those on the Cnm, and are often not fully saturated at the shallower depths.

15139 (Y/TS–1263) **Analysis of well hydrographs in a karst aquifer: Estimates of specific yields and continuum transmissivities.** Shevenell, L.A. (Univ. of Nevada, Reno, NV (United States). Nevada Bureau of Mines and Geology). Oak Ridge National Lab., TN (United States). Nov 1994. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009059. Source: OSTI; NTIS; GPO Dep.

Hydrograph analysis techniques have been well developed for hydrographs obtained from streams and springs, where data are cast in terms of total discharge. The data obtained from well hydrographs provide water level versus time; hence, a method of hydrograph analysis is required for situations in which only water level data are available. It is hypothesized here that three segments on a recession curve from wells in a karst aquifer represent drainage from three types of storage: conduit (C), fracture (F), and matrix (M). Hydrographs from several wells in a karst aquifer at the U.S. Department of Energy Oak Ridge Y-12 Plant are used to estimate the specific yields (S_y) associated with each portion of the aquifer (C, F, M), as well as continuum transmissivities (T). Data from three short injection tests at one well indicate continuum T at this well bore is $\sim 5 m^2/d$, and tests at numerous other wells in the aquifer yield results between 1 and 7 M^2/d. The T estimated with well hydrographs from two storm events indicates a T of 9.8 $m^2 2/d$. Well developed conduit systems in which water levels in wells show a flashy response typically show S_y values of 1×10^{-4}, 1×10^{-3}, and 3×10^{-3}, for C, F, and M. Less well developed conduit areas show more nearly equal S_y values (8.6×10^{-4}, 1.3×10^{-3}, 3×10^{-3}). Areas with no evidence for the presence of conduits have only one, or in some cases two, slopes on the recession curve. In these cases, water level responses are slow. Recession curves with a single slope represent drainage from only the lower T matrix. Those with two slopes have an additional, more rapid response, segment on the recession curve, which represents drainage from the higher T, lower S_y, fractures in the system.

15140 (DOE/AL/62350–130) **Comment and response document for the UMTRA Project vitro processing site completion report Salt Lake City, Utah. Revision 1.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Mar 1995. 499p. DOE Contract AC04-91AL62350. (DOE/AL/62350–129-Rev.1). Order Number DE95009880. Source: OSTI; NTIS; INIS; GPO Dep.

This Comment and Response Document is a series of UMTRA document review forms regarding the UMTRA Project Vitro Processing Site Completion Report for Salt Lake City, Utah in March, 1995. The completion report provides evidence that the final Salt Lake City, Utah, processing site property conditions are in accordance with the approved design and that all U.S. Environmental Protection Agency (EPA) standards have been satisfied. Included as appendices to support the stated conclusions are the record drawings; a summary of grid test results; contract specifications and construction drawings, the EPA standards (40 CFR Part 192); the audit, inspection, and surveillance summary; the permit information; and project photographs. The principal objective of the remedial action at Salt Lake City is to remove the tailings from the processing site, render the site free of contamination to EPA standards, and restore the site to the final design grade elevations. Each section is evaluated in detail to check all aspects of above report, especially the inclusion of adequate verification data. Each review form contains a section entitled State of Utah Response and Action, which is an explanation or correction of DOE criticisms of the report.

15141 (DOE/AL/62350–159/2/95) **Site Observational Work Plan for the UMTRA project site at Ambrosia Lake, New Mexico.** Jacobs Engineering Group, Inc., Albuquerque, NM (United States). Feb 1995. 498p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-91AL62350. Order Number DE95009461. Source: OSTI; NTIS; INIS; GPO Dep.

Ground water compliance for the Uranium Mill Tailings Remedial Action (UMTRA) Project sites, including the Ambrosia Lake, New Mexico, site, is governed by the Uranium Mills Tailings Radiation Control Act (42 USC §7901 et seq.) and the U.S. Environmental Protection Agency's Health and Environmental Protection Standards for Uranium and Thorium Mill Tailings (40 CFR Part 192; 60 FR 2854). The EPA standards describe specific conditions for which the U.S. Department of Energy (DOE) may apply for supplemental standards for contaminated ground water rather than meeting background levels or numerical standards. To achieve compliance with Subpart A of the EPA standards the residual radioactive materials are currently being consolidated on the site by the DOE in a disposal cell, isolating them from direct human or ecological contact and further dispersion into the environment. Completion of the disposal cell is scheduled for early 1995. An environmental assessment and a Finding of No Significant Impact (FONSI) were completed in 1987. Concurrence with the UMTRA Surface Project Ambrosia Lake remedial action plan (RAP) was granted by the U.S. Nuclear Regulatory Commission (NRC) and state of New Mexico in 1990. The DOE deferred compliance with Subpart B of the EPA standards in the Surface Project RAP. This site observational work plan (SOWP) is the first document to address ground water compliance under Subpart B at the Ambrosia Lake site. The Ambrosia Lake UMTRA Project site is within the Grants Mineral Belt and was one of numerous uranium mills supplied by many local mines. Ground water contamination at the site occurred as a result of uranium mill operations. Contamination of ground water resulted from discharge of waste water, infiltration of water through the tailings pile, hydraulic placement of mill tailings in nearby mines, and water pumped from mine shafts.

15142 (DOE/NV/11432–167) **U.S. Department of Energy, Nevada Operations Office, Environmental Monitoring Program: Summary data report - first and second calendar quarters**

1994. Black, S.C.; Glines, W.M.; Townsend, Y.E. (eds.). Reynolds Electrical and Engineering Co., Inc., Las Vegas, NV (United States). Nov 1994. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC08-94NV11432. Order Number DE95009439. Source: OSTI; NTIS; INIS; GPO Dep.

During the first and second quarters of 1994 air samples were collected and analyzed from 54 air particulate/halogen sampling stations, 10 noble gas sampling stations and 19 tritiated water vapor sampling stations. Surface water samples were collected and analyzed from 12 open water supply reservoirs, 8 natural springs, 2 wastewater containment ponds and 9 sewage lagoons. Groundwater samples were obtained brom 10 potable and 1 non-potable supply wells, and 8 drinking water consumption points. Ambient radiation levels were measured at 193 locations.

15143 (DOE/RL–93-81) **Limited field investigation report for the 100-NR-2 Operable Unit, Hanford Site, Richland, Washington.** USDOE Richland Operations Office, WA (United States). Mar 1995. 93p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95009565. Source: OSTI; NTIS; INIS; GPO Dep.

This limited field investigation (LFI) was conducted to.determine the nature and extent of hazardous and radioactive materials present in the groundwater. This information is used to assess the applicability of interim remedial measures (IRM) for reducing human health and environmental risks within the 100-NR-2 Groundwater Operable Unit. Sampling of existing wells and the installation of one new monitoring well were the methods of investigation used during this LFI. Analytical data were subjected to validation under the Resource Conservation and Recovery Act (RCRA) program. The groundwater analyses were screened to identify contaminants of potential concern (COPC). This screening method eliminated from further consideration constituents that were below background. Constituents considered nontoxic to humans were eliminated from the human health evaluation. Data inconsistency and blank contamination were also evaluated in the screening process. These COPC were evaluated further in the qualitative risk assessment (QRA). A QRA was performed using conservative analyses. The human health risk assessment evaluated frequent-use and occasional-use scenarios. The QRA analysis indicates that there is a medium human health risk for the frequent-use scenario and a low human health risk for the occasional-use scenario. Neither of these land use scenarios currently occur at the site.

15144 (DOE/RL–94-59-Draft-A) **100-BC-5 operable unit focused feasibility study report. Draft A.** Bechtel Hanford, Inc., Richland, WA (United States). Oct 1994. 513p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95009557. Source: OSTI; NTIS; INIS; GPO Dep.

This focused feasibility study report presents the detailed analysis of alternatives for both interim remedial measures and potential future actions for the 100-BC-5 operable Unit. The limited investigation recommended that the operable unit be removed from the IRM pathway as defined in the Hanford Past-Practice Strategy. The FFS was initiated in support of a final action. In the course of evaluating alternatives, it was recognized that the data were insufficient to support a final action. Consequently, the unit managers decided to complete the document as an interim FFS to document the modeling and evaluation efforts done to date. The potential contaminant of interest in the operable unit for a final action would be Sr-90, with a calculated incremental cancer risk of 2E-06 based on an occasional-use exposure scenario and which exceeds the Safe Drinking Water Act maximum contaminant level in the near-river wells. The modeling to support the evaluation of alternatives was based on Sr-90 data from groundwater monitoring wells in the operable unit. The 100-BC-5 unit is one of three operable units associated with the 100 B/C Area of the site. Two of the 100 B/C operable units are source units. The 100-BC-5 Groundwater Operable Unit includes the groundwater beneath the source operable units and the adjacent groundwater, surface water, fluvial sediments, and aquatic biota impacted by the overlying source operable unit. The key assumptions which form the basis for the FFS are: addressing an identified threat to human health or the environment; protecting the Columbia River and to abate offsite migration of contaminants; containment and control of contaminant plumes; occasional-use scenario is assumed for the operable unit; a finite lifecycle for the IRM to the year 2008; the 100 Area Feasibility Study Phases I & 2 forms the basis for the alternatives evaluated in the FFS; disposal to the Environment Restoration Disposal Facility is assumed for all solid wastes generated.

15145 (ES/ESH–50) **Portsmouth Gaseous Diffusion Plant annual site environmental report for 1993.** Horak, C.M. (ed.). Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States); Martin Marietta Energy Systems, Inc., Piketon, OH (United States). Nov 1994. 166p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; AC05-76OR00001. (POEF–3050). Order Number DE95006673. Source: OSTI; NTIS; INIS; GPO Dep.

This calendar year (CY) 1993 annual report on environmental monitoring of the US Department of Energy's (DOE's) Portsmouth Gaseous Diffusion Plant (Portsmouth) and its environs consists of three separate documents: a summary pamphlet for the general public; a more detail discussion and of compliance status, data, and environmental impacts (this document); and a volume of detailed data that is available on request. The objectives of this report are to report compliance status during 1993; provide information about the plant site and plant operations; report 1993 monitoring data for the installation and its environs that may have been affected by operations on the plant site; document information on input and assumptions used in calculations; provide trend analyses (where appropriate) to indicate increases and decreases in environmental impact, and provide general information on quality assurance for the environmental monitoring program.

15146 (PNL–10484) **In situ mapping of radionuclides in subsurface and surface soils: 1994 Summary report.** Schilk, A.J.; Hubbard, C.W.; Knopf, M.A.; Abel, K.H. Pacific Northwest Lab., Richland, WA (United States). Apr 1995. 39p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010407. Source: OSTI; NTIS; INIS; GPO Dep.

Uranium production and support facilities at several DOE sites occasionally caused local contamination of some surface and subsurface soils. The thorough cleanup of these sites is a major public concern and a high priority for the US Department of Energy, but before any effective remedial protocols can be established, the three-dimensional distributions of target contaminants must be characterized. Traditional means of measuring radionuclide activities in soil are cumbersome, expensive, time-consuming, and often do not accurately reflect conditions over very large areas. New technologies must be developed, or existing ones improved, to allow cheaper, faster, and safer characterization of radionuclides in soils at these sites. The Pacific Northwest Laboratory (PNL) was tasked with adapting, developing, and demonstrating technologies to measure uranium in surface and subsurface soils. In partial completion of this effort, PNL developed an improved in situ gamma-ray spectrometry system to satisfy the technical requirements. This document summarizes fiscal-year 1994 efforts at PNL to fulfill requirements for TTP #321103 (project #19307). These requirements included (a) developing a user-friendly software package for reducing field-acquired gamma-ray spectra, (b) constructing an improved data-acquisition hardware system for use with high-purity germanium detectors, (c) ensuring readiness to conduct field mapping exercises as specified by the sponsor, (d) evaluating the in situ gamma-ray spectrometer for the determination of uranium depth distribution, and (e) documenting these efforts.

15147 (RFP–4935) **Modeling one-dimensional unsaturated flow at the Rocky Flats Environmental Technology Site near Golden, Colorado.** Thompson, J.S. (EG and G Rocky Flats, Inc., Golden, CO (United States)); Zeiler, R.M. EG and G Rocky Flats, Inc., Golden, CO (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. (CONF-9505188–2: 1995 American Institute of Hydrology annual meeting, Denver, CO (United States), 14-18 May 1995). Order Number DE95009113. Source: OSTI; NTIS; INIS; GPO Dep.

A field investigation characterizing contamination at the Rocky Flats Plant (Rocky Flats Environmental Technology Site) near

Golden, Colorado revealed unexpectedly high moisture contents in the unsaturated soil column (vadose zone) beneath several of the Plant's Waste Water Treatment Plant (WWTP) sludge drying beds. Because these beds were seldom in use, researchers had hypothesized that the water required to maintain the saturated conditions observed beneath several of the sludge drying beds was coming from sources other than the beds themselves. In an effort to substantiate this hypothesis, a one-dimensional physically-based unsaturated flow model was utilized to simulate the vertical movement of moisture from the sludge drying beds into the unsaturated soil column below. The model was run to simulate vertical flow over a two-year period and results indicated that no significant changes from initial conditions were apparent. This evidence supports the hypothesis that the high moisture contents found beneath the sludge drying beds are being fed by sources other than infiltration of sludge applied to the beds themselves. This paper presents the details of the simulation and provides further evidence of the hypothesized flow regime.

15148 (UCRL-JC–119115) **Reaction progress pathways for glass and spent fuel under unsaturated conditions.** Bates, J.; Finn, P.; Bourcier, W.; Stout, R. Lawrence Livermore National Lab., CA (United States). Oct 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950570–17: International high-level radioactive waste management conference: progress toward understanding, Las Vegas, NV (United States), 1-5 May 1995). Order Number DE95009472. Source: OSTI; NTIS; INIS; GPO Dep.

The source term for the release of radionuclides from a nuclear waste repository is the waste form. In order to assess the performance of the repository and the engineered barrier system (EBS) compared to regulations established by the Nuclear Regulatory Commission and the Environmental Protection Agency it is necessary (1) to use available data to place bounding limits on release rates from the EBS, and (2) to develop a mechanistic predictive model of the radionuclide release and validate the model against tests done under a variety of different potential reaction conditions. The problem with (1) is that there is little experience to use when evaluating waste form reaction under unsaturated conditions such that errors in applying expert judgment to the problem may be significant. The second approach, to test and model the waste form reaction, is a more defensible means of providing input to the prediction of radionuclide release. In this approach, information related to the source term has a technical basis and provides a starting point to make reasonable assumptions for long-term behavior. Key aspects of this approach are an understanding of the reaction progress mechanism and the ability to model the tests using a geochemical code such as EQ3/6. Current knowledge of glass, UO_2, and spent fuel reactions under different conditions are described below.

15149 (USGS-OFR–94-451) **Summary of lithologic logging of new and existing boreholes at Yucca Mountain, Nevada, March 1994 to June 1994.** Geslin, J.K.; Moyer, T.C. Geological Survey, Denver, CO (United States). 1995. 16p. Sponsored by Geological Survey, Reston, VA (United States);USDOE, Washington, DC (United States). DOE Contract AI08-92NV10874. Order Number DE95009443. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes lithologic logging of core from boreholes at Yucca Mountain, Nevada, conducted from March 1994 to June 1994. Units encountered during logging include Quaternary-Tertiary alluvium and colluvium, Tertiary Rainier Mesa Tuff, all units in the Tertiary Paintbrush Group, and Tertiary Calico Hills Formation. Logging results are presented in a table of contact depths for core from unsaturated zone neutron (UZN) boreholes and graphic lithologic logs for core from north ramp geology (NRG) boreholes.

15150 (WHC-EP–0741) **Final report: Fiscal Year 1993 activities for the Line Loss Study.** Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 148p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010068. Source: OSTI; NTIS; INIS; GPO Dep.

Deficiencies in air monitoring and sampling systems at WHC, identified in WHC Compliance Plan CP89-16, include line loss quantification, potential proportional sampling errors, quantification of sampling/measurement system bias, and overall system calibrations. 'Tiger Team' assessment number A/BMPF-3 identifies line losses as a potential for large sampling errors. The objective of the work performed during FY 1993 was to provide reports and assessments for specific stack sampling systems on the associated particle line loss for those sampling lines.

15151 (WHC-EP–0852) **Final report on fiscal year 1994 activities for the line loss study.** Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 160p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010066. Source: OSTI; NTIS; INIS; GPO Dep.

The Line Loss study has been a four-year effort to provide data and analysis for air monitoring and sampling systems at Hanford. This document presents the results of measurements obtained from the Plutonium-Uranium Extraction (PUREX) Plant and T Plant Main Stacks obtained during FY 1994. The work performed during FY 1994 was consistent with the action plans contained in Compliance Plan CP89-16. The study was initiated in 1991 in response to Tiger Team items A/CF-1 and A/BMPF-3 regarding representative sampling for the stack record samplers at some of the main Hanford Site stacks. Representative sampling is a compliance requirement for 40 CFR 61. The US EPA Compliance Order and Information Request received by the US DOE Richland Operations Office (RL) in February, 1993, also requested scheduling information for the study. RL received a letter in September, 1993, from the EPA stating their current views that estimates of line losses are considered adequate for the 40 CFR 61 Subpart H-affected stacks. The EPA has no further formal interest in the study, although they are still interested in receiving results of the study. The work performed during FY 1991 and FY 1992 generated the initial data on line losses and assisted in the development of evaluation and assessment methods that could be used to determine potential line losses in other Hanford stack monitoring systems. The work performed during FY 1993 included measurements on sampling lines associated with the PUREX Main Stack and the B Plant Main Stack. The cascade impactor measurements on the PUREX Main Stack were repeated during FY 1994 because of operational problems during the FY 1993 measurements. The analyses for the B Plant samples had not been received before the delivery date for the final report on the FY 1993 activities. The decision was made to publish a separate report specifically for the B Plant results during FY 1994 after the results had been received from the laboratory and verified.

15152 (WHC-SD-W007H-OTP–001) **Operability test procedure for the TK-900 beta/gamma liquid effluent monitoring system.** Weissenfels, R.D. Westinghouse Hanford Co., Richland, WA (United States). 24 Feb 1995. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008420. Source: OSTI; NTIS; INIS; GPO Dep.

This operability test procedure will verify that the 221-B beta/gamma liquid effluent monitoring system, installed near the east end of the six inch chemical sewer header, functions as intended by design. An off-line, skid mounted, beta/gamma radiation monitor and pH monitor was installed near stairwell three in the 221-B electrical gallery by Project W-007H. The skid mounted monitoring system includes two radiation detectors and a pH meter, both with local digital displays. Output signals from each monitor are also received and displayed by the Facility Process Monitor and Control System (FPMCS). Pumps, motors, gauges, valves and transport lines complement the skid monitoring system. The system is part of BAT/AKART for the BCE liquid effluent system.

15153 (Y/EN–5288) **Final report for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils.** Oak Ridge Y-12 Plant, TN (United States); IT Corp., Knoxville, TN (United States). Sep 1994. 432p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009046. Source: OSTI; NTIS; GPO Dep.

IT Corporation (IT) was contracted by Martin Marietta Energy Systems, Inc. (Energy Systems) to perform a pilot-scale demonstration of the effectiveness of thermal desorption as a remedial technology for removing mercury from the Lower East Fork Poplar Creek (LEFPC) floodplain soil. Previous laboratory studies by Energy Systems suggested that this technology could reduce mercury

to very low levels. This pilot-scale demonstration study was initiated to verify on an engineering scale the performance of thermal desorption. This report includes the details of the demonstration study, including descriptions of experimental equipment and procedures, test conditions, sampling and analysis, quality assurance (QA), detailed test results, and an engineering assessment of a conceptual full-scale treatment facility. The specific project tasks addressed in this report were performed between October 1993 and June 1994. These tasks include soil receipt, preparation, and characterization; prepilot (bench-scale) desorption tests; front-end materials handling tests; pilot tests; back-end materials handling tests; residuals treatment; and engineering scale-up assessment.

15154 (Y/EN–5289/V2) **Final report from VFL technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils. LEFPC Appendices, Volume 2, Appendix V-A.** Oak Ridge Y-12 Plant, TN (United States); VFL Technology Corp., Malvern, PA (United States). Sep 1994. 509p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009194. Source: OSTI; NTIS; GPO Dep.

This document contains information concerning validation of analytical data for the pilot-scale thermal treatment of Lower East Fork Poplar Creek Floodplain soils located at the Y-12 Plant site. This volume is an appendix of compiled data from this validation process.

15155 (Y/EN–5289/V5) **Final report from VFL Technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils. LEFPC appendices. Volume 5. Appendix V-D.** Oak Ridge National Lab., TN (United States). Sep 1994. 350p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009049. Source: OSTI; NTIS; INIS; GPO Dep.

This final report from VFL Technologies for the pilot-scale thermal treatment of lower East Fork Poplar Creek floodplain soils dated September 1994 contains LEFPC Appendices, Volume 5, Appendix V - D. This appendix includes the final verification run data package (PAH, TCLP herbicides, TCLP pesticides).

15156 (Y/EN–5289/V6) **Final report from VFL Technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils. LEFPC appendices. Volume 6. Appendix VI-X.** Oak Ridge National Lab., TN (United States). Sep 1994. 102p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009048. Source: OSTI; NTIS; INIS; GPO Dep.

This final report from VFL Technologies for the pilot-scale thermal treatment of lower East Fork Poplar Creek floodplain soils dated September 1994 contains LEFPC Appendices, Volume 6, Appendix VI - X. These appendices cover the following areas: chain of custody, miscellaneous process calculations (residence time and orifice plate calculations), waste management (mercury and radiation confirmatory testing before and after final verification run), health and safety (training, respirator fit test and radiation work permits), and transportation (soil receipt documentation).

15157 (Y/SUB–94-99069C(Y13)/1) **Fiscal year 1994 well installation program summary report, Y-12 Plant, Oak Ridge, Tennessee.** Oak Ridge Y-12 Plant, TN (United States); Science Applications International Corp., Oak Ridge, TN (United States). Sep 1994. 85p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009056. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the well installation activities conducted during the federal fiscal year (FY) 1994 drilling program at the Oak Ridge Y-12 Plant, Oak Ridge, Tennessee. Synopses of monitoring well construction/well development data, well location rationale, geological/hydrological observations, quality assurance/quality control methods, and health and safety monitoring are included. Two monitoring wells were installed and one piezometer installation was attempted, but not completed, during the FY 1994 drilling program. In addition, SAIC provided health and safety and geotechnical oversight for two soil borings in support of the Y-12 Underground Storage Tank (UST) Program. All new monitoring wells were developed by either a 2.0-in. diameter swab rig or by hand bailing until nonspecific indicator parameters (pH and specific conductance) attained steady-state levels. Turbidity levels were lowered, if required, to the extent practicable by continued development beyond a steady-state level of pH and conductance. All well installation was conducted following industry-standard methods and approved procedures in the Environment Surveillance Procedures Quality Control Program (Energy Systems 1988), the Resource Conservation and Recovery Act (RCRA) Groundwater Monitoring Technical Enforcement Guidance Document (EPA 1986), and Guidelines for Installation of Monitor Wells at the Y-12 Plant (Geraghty and Miller 1985). Health and safety monitoring and field screening of drilling returns and development waters were conducted in accordance with approved Martin Marietta Energy Systems, Inc. (Energy Systems) guidelines. All of the monitoring wells installed during FY 1994 at the Y-12 Plant were of screened construction.

15158 (Y/SUB–94/EAQ10C/3/P2) **Calendar year 1993 groundwater quality report for the Chestnut Ridge Hydrogeologic Regime Y-12 Plant, Oak Ridge, Tennessee. 1993 Groundwater quality data interpretations and proposed program modifications.** Oak Ridge Y-12 Plant, TN (United States); HSW Environmental Consultants, Inc., Oak Ridge, TN (United States). Sep 1994. 125p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009066. Source: OSTI; NTIS; INIS; GPO Dep.

This groundwater quality report (GWQR) contains an evaluation of the groundwater quality data obtained during the 1993 calendar year (CY) at several hazardous and non-hazardous waste management facilities associated with the US DOE Y-12 Plant located on the DOE Oak Ridge Reservation (ORR) southeast of Oak Ridge, Tennessee. The groundwater quality data are presented in Part 1 of the GWQR submitted by Martin Marietta Energy Systems, Inc. to the Tennessee Department of Environment and Conservation (TDEC) in February 1994. Groundwater quality data evaluated in this report were obtained at several hazardous and non-hazardous waste management sites located within the Chestnut Ridge Hydrogeologic Regime (Chestnut Ridge Regime). The Chestnut Ridge Regime encompasses a section of Chestnut Ridge south of the Y-12 Plant and is one of three hydrogeologic regimes defined for the purposes of groundwater quality monitoring at the plant. The Environmental Management Department of the Y-12 Plant Health, Safety, Environment, and Accountability Organization manages the groundwater monitoring activities in each regime as part of the Y-12 Plant Groundwater Protection Program (GWPP). The annual GWQR for the Chestnut Ridge Regime is completed in two parts. Part 1 consists primarily of data appendices and serves as a reference for the groundwater quality data obtained each CY under the lead of the Y-12 Plant GWPP. Because it contains information needed to comply with Resource Conservation and Recovery Act (RCRA) interim status assessment monitoring and reporting requirements, the Part 1 GWQR is submitted to the TDEC by the RCRA reporting deadline (March 1 of the following CY). Part 2 (this report) contains an evaluation of the data with respect to regime-wide groundwater quality, presents the findings and status of ongoing hydrogeologic studies, describes changes in monitoring priorities, and presents planned modifications to the groundwater sampling and analysis activities.

15159 (Y/TS–1272) **An assessment of the radiological doses resulting from accidental uranium aerosol releases and fission product releases from a postulated criticality accident at the Oak Ridge Y-12 Plant.** Fisher, S.E.; Lenox, K.E. Oak Ridge Y-12 Plant, TN (United States). Mar 1995. 67p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. (ORNL/TM–12782). Order Number DE95010227. Source: OSTI; NTIS; INIS; GPO Dep.

A dose assessment for two separate normalized source terms was conducted for the Oak Ridge Y-12 Plant. The first source term consisted of the noble gas and iodine fission products emanating from a postulated criticality with a magnitude of 10^{19} fissions. The second postulated source term was 1 kg of respirable highly enriched uranium. The MELCOR Accident Consequence Code System 2 (MACCS2) (beta test) computer code was used for this assessment. Both fixed weather (e.g., constant weather assumed throughout the accident) and sampled weather cases were

performed using MACCS2. The results of the analysis are summarized in terms of the effective dose equivalent as a function of distance along the downwind centerline of the plume. In addition, population doses for the workers and the public are presented. A brief code comparison between the MACCS2 and MESORAD computer codes is also presented. Modeling differences for the cloudshine and groundshine dose pathways are discussed. Finally, the dose results are summarized, and recommendations are provided that enable the reader to make quick estimates of downwind doses for different source terms that are scalable.

15160 (ANL/EA/CP–84148) **Radiological accidents potentially important to human health risk in the U.S. Department of Energy waste management program.** Mueller, C. (Argonne National Lab., IL (United States)); Roglans-Ribas, J.; Folga, S.; Nabelssi, B.; Jackson, R. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–109: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008292. Source: OSTI; NTIS; INIS; GPO Dep.

Human health risks as a consequence of potential radiological releases resulting from plausible accident scenarios constitute an important consideration in the US Department of Energy (DOE) national program to manage the treatment, storage, and disposal of wastes. As part of this program, the Office of Environmental Management (EM) is currently preparing a Programmatic Environmental Impact Statement (PEIS) that evaluates the risks that could result from managing five different waste types. This paper (1) briefly reviews the overall approach used to assess process and facility accidents for the EM PEIS; (2) summarizes the key inventory, storage, and treatment characteristics of the various DOE waste types important to the selection of accidents; (3) discusses in detail the key assumptions in modeling risk-dominant accidents; and (4) relates comparative source term results and sensitivities.

15161 (ANL/EA/CP–84160) **Accident analysis for transuranic waste management alternatives in the U.S. Department of Energy waste management program.** Nabelssi, B. (Argonne National Lab., IL (United States)); Mueller, C.; Roglans-Ribas, J.; Folga, S.; Tompkins, M.; Jackson, R. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–104: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008286. Source: OSTI; NTIS; INIS; GPO Dep.

Preliminary accident analyses and radiological source term evaluations have been conducted for transuranic waste (TRUW) as part of the US Department of Energy (DOE) effort to manage storage, treatment, and disposal of radioactive wastes at its various sites. The approach to assessing radiological releases from facility accidents was developed in support of the Office of Environmental Management Programmatic Environmental Impact Statement (EM PEIS). The methodology developed in this work is in accordance with the latest DOE guidelines, which consider the spectrum of possible accident scenarios in the implementation of various actions evaluated in an EIS. The radiological releases from potential risk-dominant accidents in storage and treatment facilities considered in the EM PEIS TRUW alternatives are described in this paper. The results show that significant releases can be predicted for only the most severe and extremely improbable accidents sequences.

15162 (ANL/EA/CP–84163) **Issues related to uncertainty in projections of hazardous and mixed waste volumes in the U.S. Department of Energy's environmental restoration program.** Picel, K.C. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–107: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008289. Source: OSTI; NTIS; INIS; GPO Dep.

Projected volumes of contaminated media and debris at US Department of Energy (DOE) environmental restoration sites that are potentially subject to the hazardous waste provisions of the Resource Conservation and Recovery Act are needed to support programmatic planning. Such projections have been gathered in various surveys conducted under DOE's environmental restoration and waste management programs. It is expected that reducing uncertainty in the projections through review of existing site data and process knowledge and through further site characterization will result in substantially lowered projections. If promulgated, the US Environmental Protection Agency's Hazardous Waste Identification Rule would result in potentially even greater reductions in the projections when site conditions are reviewed under the provisions of the new rule. Reducing uncertainty in projections under current and future waste identification rules may be necessary to support effective remediation planning. Further characterization efforts that may be conducted should be designed to limit uncertainty in identifying volumes of wastes to the extent needed to support alternative selection and to minimize costs of remediation.

15163 (ANL/EA/CP–84167) **Case study: Evaluation of a scenario for the reuse of structures in the production area at Fernald.** Davis, M.J. (Argonne National Lab., IL (United States)); Folga, S.; Janke, R.J.; Kozlowski, D.R. Argonne National Lab., IL (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–99: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008279. Source: OSTI; NTIS; INIS; GPO Dep.

The potential for the reuse of uncontaminated structures at federal facilities that are being remediated should be evaluated. Although various factors often limit the viability of such reuse, it may be economically attractive to reuse selected structures. Consideration of a hypothetical reuse scenario for the US Department of Energy's Fernald, Ohio facility shows that the reuse of selected buildings that were not significantly contaminated by production activities at the site may be considerably less expensive than the construction of new ones. The cost of removal of existing buildings is a major factor influencing the relative advantages of these two options. For Fernald, no need for the facility's buildings has been identified; however, the reuse of structures may be a viable option at other facilities.

15164 (ANL/EA/CP–84360) **Progress on integrating environmental restoration data into mixed waste updates.** Tolbert-Smith, M. (USDOE, Washington, DC (United States)); MacDonell, M.; Peterson, J.; Kirkpatrick, T. Argonne National Lab., IL (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–106: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008290. Source: OSTI; NTIS; INIS; GPO Dep.

The Federal Facility Compliance Act required the Department of Energy to compile specific information on the volumes, characteristics, and treatment plans for mixed wastes, and to provide this information to the Environmental Protection Agency and affected states. The initial format for reporting this information was developed largely on the basis of operations wastes. Although this format is acceptable for stored environmental restoration wastes, it was found to be poorly suited for reporting wastes that could be generated by future cleanup activities, many of which have not yet been well defined. Modifications to the process initially used to report restoration wastes were made to allow them to be reported in a manner that more accurately reflects uncertainties inherent in such estimates. This revised approach allowed for the smooth integration of data for restoration wastes with those compiled by the waste management team for mixed waste inventory updates.

15165 (ANL/EA/CP–85502) **An overview of the corrective action management unit and temporary unit regulations.** Green, D.R. (Argonne National Lab., IL (United States)); Corathers,

L.; Coalgate, J. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–98: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008278. Source: OSTI; NTIS; INIS; GPO Dep.

In February 1993, the US Environmental Protection Agency (EPA) promulgated the corrective action management unit (CAMU) and temporary unit (TU) regulations as 40 CFR Part 264, Subpart S. These regulations are intended to foster the selection of protective and cost-effective remedies for the restoration of sites contaminated by hazardous substances, hazardous wastes, and hazardous waste constituents by removing certain regulatory impediments to implementing those remedies, most notably those of the land disposal restrictions (LDRs). This paper provides a brief overview of the CAMU and TU regulations.

15166 (ANL/EAD/TM–41) **Derivation of residual radioactive material guidelines for uranium in soil at the Middlesex Sampling Plant Site, Middlesex, New Jersey.** Dunning, D.E. (Argonne National Lab., IL (United States). Environmental Assessment Div.). Argonne National Lab., IL (United States). Feb 1995. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95009190. Source: OSTI; NTIS; INIS; GPO Dep.

Residual radioactive material guidelines for uranium in soil were derived for the Middlesex Sampling Plant (MSP) site in Middlesex, New Jersey. This site has been designated for remedial action under the Formerly Utilized Sites Remedial Action Program (FUSRAP) of the US Department of Energy. The site became contaminated from operations conducted in support of the Manhattan Engineer District (MED) and the Atomic Energy Commission (AEC) between 1943 and 1967. Activities conducted at the site included sampling, storage, and shipment of uranium, thorium, and beryllium ores and residues. Uranium guidelines for single radioisotopes and total uranium were derived on the basis of the requirement that the 50-year committed effective dose equivalent to a hypothetical individual living or working in the immediate vicinity of the MSP site should not exceed a dose of 30 mrem/yr following remedial action for the current-use and likely future-use scenarios or a dose of 100 mrem/yr for less likely future-use scenarios. The RESRAD computer code, which implements the methodology described in the DOE manual for establishing residual radioactive material guidelines, was used in this evaluation. Four scenarios were considered for the site. These scenarios vary regarding future land use at the site, sources of water used, and sources of food consumed.

15167 (CONF-9304128–, pp. H.3-H.22) **Progress update at Weldon Spring; focus on buildings demolition.** Green, S. USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Uranium and thorium were processed at the Weldon Spring site from 1957 through 1966. Operations contaminated the 44 buildings, surrounding land areas, and waste pits. The site is being cleaned up to meet the requirements of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) and the National Environmental Policy Act (NEPA). An important phase of the remedial action has been occurring for the past year: the decontamination and demolition of the most highly contaminated uranium and thorium processing facilities. Work involves asbestos abatement, cleanup of chemical contaminants such as PCBs, removal of radioactive product residues, and building wash down, followed by demolition. The health physics aspects of this work present some atypical challenges. These include controlling airborne emissions given physical limitations on the use of engineering controls in dilapidated buildings, the need to superimpose asbestos abatement regulations on radiological work, and management of the large volume of waste generated, including mixed waste. This paper discusses the method of accomplishing the work and operational health physics practices used to keep environmental release of radioactive material and worker exposures ALARA.

15168 (CONF-9304128–, pp. J.17-J.22) **Radiological hazard classification of DOE facilities by DOE STD-1027-92: LANL nuclear facility list.** Elder, J.C. (Los Alamos National Lab., NM (United States)). USDOE Assistant Secretary for Environment, Safety, and Health, Washington, DC (United States). Office of Health; USDOE Nevada Field Office, Las Vegas, NV (United States). [1993]. From Department of Energy (DOE) radiation protection conference; Las Vegas, NV (United States); 13-15 Apr 1993. In *1993 Radiation Protection Workshop: Proceedings.* 431p. Order Number DE95004507. Source: OSTI; NTIS; INIS; GPO Dep.

Los Alamos facilities containing significant radiological hazards have been reclassified according to DOE-STD 1027-92, a recently issued guide for hazard classification. DOE-STD 1027-92 was provided in support of DOE Order 5480.23 to identify which facilities would be governed under DOE 5480.23 requirements; these would presumably be called nuclear facilities. This new classification has affected the original list of 18 LANL nuclear facilities by increasing it to 39. It has also lowered the classification of TA-55-4, the plutonium processing facility containing highest intrinsic hazard at LANL, from the highest classification to an intermediate classification. This presentation addresses the impact of these changes in the nuclear facility list in the areas of radiological health, safety analysis documentation, and risk management.

15169 (CONF-9504131–1) **HASCAL – A system for estimating contamination and doses from incidents at worldwide nuclear facilities.** Sjoreen, A.L. (Oak Ridge National Lab., TN (United States). Computing Applications Div.); Sykes, R.I. Oak Ridge National Lab., TN (United States). [1995]. 3p. Sponsored by Defense Nuclear Agency, Washington, DC (United States). DOE Contract AC05-84OR21400. From 5. American Nuclear Society (ANS) topical meeting on emergency preparedness and response; Aiken, SC (United States); Apr 1995. Order Number DE95008904. Source: OSTI; NTIS; INIS; GPO Dep.

The Hazard Assessment System for Consequence Analysis (HASCAL) is being developed to support the analysis of radiological incidents anywhere in the world for the Defense Nuclear Agency (DNA). HASCAL is a component of the Hazard Prediction and Assessment Capability (HPAC), which is a comprehensive nuclear, biological, and chemical hazard effects planning and forecasting modeling system that is being developed by DNA. HASCAL computes best-guess estimates of the consequences of radiological incidents. HASCAL estimates the amount of radioactivity released, its atmospheric transport and deposition, and the resulting radiological doses.

15170 (DOE/ER–0640) **Program overview: Subsurface science program.** USDOE Office of Energy Research, Washington, DC (United States). Environmental Sciences Div. Mar 1994. 18p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010163. Source: OSTI; NTIS; INIS; GPO Dep.

The OHER Subsurface Science Program is DOE's core basic research program concerned with subsoils and groundwater. These practices have resulted in contamination by mixtures of organic chemicals, inorganic chemicals, and radionuclides. A primary long-term goal is to provide a foundation of knowledge that will lead to the reduction of environmental risks and to cost-effective cleanup strategies. Since the Program was initiated in 1985, a substantial amount of research in hydrogeology, subsurface microbiology, and the geochemistry of organically complexed radionuclides has been completed, leading to a better understanding of contaminant transport in groundwater and to new insights into microbial distribution and function in the subsurface environments. The Subsurface Science Program focuses on achieving long-term scientific advances that will assist DOE in the following key areas: providing the scientific basis for innovative in situ remediation technologies that are based on a concept of decontamination through benign manipulation of natural systems; understanding the complex mechanisms and process interactions that occur in the subsurface; determining the influence of chemical and geochemical-microbial processes on co-contaminant mobility to reduce environmental risks; improving predictions of contaminant transport that draw on fundamental knowledge of contaminant behavior in the presence of physical and chemical heterogeneities to improve cleanup effectiveness and to predict environmental risks.

15171 (DOE/HWP–130) **Literature search, review, and compilation of data for chemical and radiochemical sensors: Task 1 report.** Oak Ridge National Lab., TN (United States). HAZWRAP Support Contractor Office; Advanced Sciences, Inc., Albuquerque, NM (United States). Jan 1993. 208p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009602. Source: OSTI; NTIS; INIS; GPO Dep.

During the next several decades, the US Department of Energy is expected to spend tens of billions of dollars in the characterization, cleanup, and monitoring of DOE's current and former installations that have various degrees of soil and groundwater contamination made up of both hazardous and mixed wastes. Each of these phases will require site surveys to determine type and quantity of hazardous and mixed wastes. It is generally recognized that these required survey and monitoring efforts cannot be performed using traditional chemistry methods based on laboratory evaluation of samples from the field. For that reason, a tremendous push during the past decade or so has been made on research and development of sensors. This report contains the results of an extensive literature search on sensors that are used or have applicability in environmental and waste management. While restricting the search to a relatively small part of the total chemistry spectrum, a sizable body of reference material is included. Results are presented in tabular form for general references obtained from data base searches, as narrative reviews of relevant chapters from proceedings, as book reviews, and as reviews of journal articles with particular relevance to the review. Four broad sensor types are covered: electrochemical processes, piezoelectric devices, fiber optics, and radiochemical processes. The topics of surface chemistry processes and biosensors are not treated separately because they often are an adjunct to one of the four sensors listed. About 1,000 tabular entries are listed, including selected journal articles, reviews of conference/meeting proceedings, and books. Literature to about mid-1992 is covered.

15172 (DOE/RL–93-54-Draft-A) **Risk evaluation of remedial alternatives for the Hanford Site.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Sep 1994. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95007600. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides guidance on the process of risk evaluation of remedial alternatives (RERA) at the Hanford Site. Remediation activities at the Hanford Site are being conducted pursuant to the Comprehensive Environmental Restoration, Compensation, and Liability Act and the Resource Conservation and Recovery Act. This document identifies points in the remedial alternative selection process where risk assessment input is either required or desirable. For each of these points of application, the document identifies issues to consider and address, and suggests possible approaches, techniques, and appropriate levels of detail. The level of detail of a RERA is driven by the need to use risk as a criterion for selecting a remedial alternative. Such a document is needed to ensure that RERA is conducted in a consistent manner, and to prevent restating or creating guidance within each RERA.

15173 (DOE/RL–94-42) **Limited field investigation report for the 100-BC-2 Operable Unit.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Nov 1994. 165p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95009555. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the data collection and analysis activities conducted during the limited field investigation and presents the associated qualitative risk assessment (QRA). It provides recommendations on the continued candidacy for interim remedial measures (IRM) for the 3 high-priority waste sites and 11 solid waste burial grounds in this operable unit. Purpose of this report is to summarize the site characterization activities, refine the conceptual exposure model as needed, identify chemical- and location-specific applicable or relevant and appropriate requirements, provide a QRA of risks associated with high-priority sites and a solid waste burial ground, and identify candidate sites for remaining on the IRM path. (The 100-BC-2 Source Operable Unit consists of 1.7 km^2 (0.6 mi^2) within the 100 B/C Area; the operable unit contains waste sites associated with the original plant facilities constructed to support operation of C Reactor and liquid, sludge, and solid waste units.)

15174 (DOE/RL–94-53-Draft-A) **Limited field investigation report for the 100-HR-2 Operable Unit.** USDOE Richland Operations Office, WA (United States); Bechtel National, Inc., Richland, WA (United States). Sep 1994. 190p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-93RL12367. Order Number DE95008318. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes the data collection and analysis activities conducted during the 100-HR-2 Operable Unit investigative phase and the associated qualitative risk assessment (QRA). The 100-HR-2 Operable Unit contains solid waste burial grounds, an ash pit, burn pits, electrical facilities, septic systems, and support facilities. All known and suspected areas of contamination were classified as solid waste burial grounds or low-priority waste sites based on the collective knowledge of the operable unit managers (representatives from the US Department of Energy [DOE], the US Environmental Protection Agency [EPA], and Washington Department of Ecology [Ecology]) during the preparation of the 100-HR-2 Operable Unit work plan (DOE/RL 1993f). Solid waste burial grounds were judged to pose sufficient risk(s), through one or more pathways, to require evaluation for an interim remedial measure (IRM) as per the Hanford Past-Practice Strategy (HPPS) (DOE/RL 1991) and negotiations with DOE, EPA, and Ecology. An IRM is intended to achieve remedies that are likely to lead to a final record of decision. Low-priority sites are those judged not to pose significant risk to require the streamlined evaluation. There were six low-priority waste sites and seven solid waste burial grounds identified. The investigative phase was conducted in accordance with the RCRA Facility Investigation/Corrective Measures Study Work Plan for the 100-HR-2 Operable Unit (DOE/RL 1993f). The QRA was performed in accordance with the Hanford Site Baseline Risk Assessment Methodology (DOE/RL 1993b) and the recommendations incorporate the strategies of the HPPS. The purpose of this report is to: (1) provide a summary of site investigative activities; (2) refine the conceptual exposure model (as needed); (3) identify chemical- and location-specific corrective action requirements; and (4) provide a human health and ecological QRA associated with solid waste burial grounds.

15175 (FEMP–2359) **Strategy utilized for assessing baseline risks to human health from K-65 and metal oxide residues stored at the Fernald Site.** Harmon, J.E. (FERMCO, Cincinnati, OH (United States). Fernald Environmental Management Project); Janke, R.C. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–91: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95009016. Source: OSTI; NTIS; INIS; GPO Dep.

The U.S. Department of Energy (DOE) is responsible for cleanup activities at the Fernald Environmental Management Project (FEMP) site in southwestern Ohio. The 425-hectare site consists of a former 55-hectare Production Area, an adjacent Waste Storage Area and various support facilities. From 1952 until 1989, the FEMP processed uranium into metallic "feed" materials for other DOE facilities in the nation's defense program. In accordance with the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA), the FEMP site is currently listed on the National Priorities List (NPL). To facilitate an expeditious cleanup effort, environmental issues associated with site cleanup are being managed under five operable units. This paper summarizes the risk assessment strategy employed to determine baseline human health risks associated with K-65 and metal oxide residues currently stored in Operable Unit 4. The K-65 and metal oxide residues were generated during the 1950s as a result of the extraction of uranium from uranium-bearing ores and concentrates. These residues are currently stored within Operable Unit 4 in concrete silos. Silos 1 and 2 contain approximately 6,120 cubic meters [m^3] (8,005 cubic yards [yd^3]) of K-65 residues, while silos 3 contains approximately 3890 m^3 (5,080 yd^3) of cold metal oxides. These concrete silos are

beyond their design life and require remedial action. The risk assessment conducted for Operable Unit 4 constitutes the first detailed human health risk assessment to be approved by the Environmental Protection Agency (EPA) for the CERCLA clean-up effort at the FEMP Site. This paper discusses the FEMP's use of a Risk Information Quality Objective process in concert with the traditional risk assessment approach to determine baseline risk to human health and the environment posed by Operable Unit 4. A summary of the baseline risks to human health is also presented.

15176 (FEMP–2367) **Waste minimization applications at a remediation site.** Allmon, L.A. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Fernald Environmental Management Project. 23 Jan 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950216–94: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95009025. Source: OSTI; NTIS; INIS; GPO Dep.

The Fernald Environmental Management Project (FEMP) owned by the Department of Energy was used for the processing of uranium. In 1989 Fernald suspended production of uranium metals and was placed on the National Priorities List (NPL). The site's mission has changed from one of production to environmental restoration. Many groups necessary for producing a product were deemed irrelevant for remediation work, including Waste Minimization. Waste Minimization does not readily appear to be applicable to remediation work. Environmental remediation is designed to correct adverse impacts to the environment from past operations and generates significant amounts of waste requiring management. The premise of pollution prevention is to avoid waste generation, thus remediation is in direct conflict with this premise. Although greater amounts of waste will be generated during environmental remediation, treatment capacities are not always available and disposal is becoming more difficult and costly. This creates the need for pollution prevention and waste minimization. Applying waste minimization principles at a remediation site is an enormous challenge. If the remediation site is also radiologically contaminated it is even a bigger challenge. Innovative techniques and ideas must be utilized to achieve reductions in the amount of waste that must be managed or dispositioned. At Fernald the waste minimization paradigm was shifted from focusing efforts on source reduction to focusing efforts on recycle/reuse by inverting the EPA waste management hierarchy. A fundamental difference at remediation sites is that source reduction has limited applicability to legacy wastes but can be applied successfully on secondary waste generation. The bulk of measurable waste reduction will be achieved by the recycle/reuse of primary wastes and by segregation and decontamination of secondary wastestreams. Each effort must be measured in terms of being economically and ecologically beneficial.

15177 (INEL–94/0005-Rev.1) **Hazard classification for the supercritical water oxidation test bed. Revision 1.** Ramos, A.G. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Oct 1994. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (EGG-WTD–11316). Order Number DE95008618. Source: OSTI; NTIS; INIS; GPO Dep.

A hazard classification of "routinely accepted by the public" has been determined for the operation of the supercritical water oxidation test bed at the Idaho National Engineering Laboratory. This determination is based on the fact that the design and proposed operation meet or exceed appropriate national standards so that the risks are equivalent to those present in similar activities conducted in private industry. Each of the 17 criteria for hazards "routinely accepted by the public," identified in the EG and G Idaho, Inc., Safety Manual, were analyzed. The supercritical water oxidation (SCWO) test bed will treat simulated mixed waste without the radioactive component. It will be designed to operate with eight test wastes. These test wastes have been chosen to represent a broad cross-section of candidate mixed wastes anticipated for storage or generation by DOE. In particular, the test bed will generate data to evaluate the ability of the technology to treat chlorinated waste and other wastes that have in the past caused severe corrosion and deposition in SCWO reactors.

15178 (ORNL–6844) **Level 3 baseline risk evaluation for Building 3506 at Oak Ridge National Laboratory, Oak Ridge, Tennessee.** Golden, K.M.; Robers, S.K.; Cretella, F.M. Oak Ridge National Lab., TN (United States). Dec 1994. 356p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008965. Source: OSTI; NTIS; INIS; GPO Dep.

This report presents the results of the Level 3 Baseline Risk Evaluation (BRE) performed on Building 3506 located at the Oak Ridge National Laboratory (ORNL). This BRE is intended to provide an analysis of the potential for adverse health effects (current or future) posed by contaminants at the facility. The decision was made to conduct a Level 3 (least rigorous) BRE because only residual contamination exists in the building. Future plans for the facility (demolition) also preclude a rigorous analysis. Site characterization activities for Building 3506 were conducted in fall of 1993. Concrete core samples were taken from the floors and walls of both the cell and the east gallery. These cores were analyzed for radionuclides and organic and inorganic chemicals. Smear samples and direct radiation measurements were also collected. Sediment exists on the floor of the cell and was also analyzed. To adequately characterize the risks posed by the facility, receptors for both current and potential future land uses were evaluated. For the current land use conditions, two receptors were evaluated. The first receptor is a hypothetical maintenance worker who spends 250 days (8 hours/day) for 25 years working in the facility. The remaining receptor evaluated is a hypothetical S and M worker who spends 2 days (8 hours/day) per year for 25 years working within the facility. This particular receptor best exemplifies the current worker scenario for the facility. The two current exposure scenarios and parameters of exposure (e.g., inhalation and ingestion rates) have been developed to provide a conservative (i.e. health protective) estimate of potential exposure.

15179 (ORNL/TM–12911) **Decontamination of surfaces by blasting with crystals of H_2O and CO_2.** Benson, C.E.; Parfitt, J.E.; Patton, B.D. Oak Ridge National Lab., TN (United States). Feb 1995. 63p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009183. Source: OSTI; NTIS; INIS; GPO Dep.

A major mission of the US Department of Energy during the 1990s is site and environmental cleanup. In pursuit of this mission, numerous remediation projects are under way and many others are being planned at Oak Ridge National Laboratory (ORNL). In this report, tests using two proposed methods for decontaminating surfaces one using water ice crystals [Crystalline Ice Blast (CIB)], the other using dry ice crystals (CO_2 Cleanblast™) – are described. Both methods are adaptations of the commonly used sand blasting technology. The two methods tested differ from sand blasting in that the particles are not particularly abrasive and do not accumulate as particles in the wastes. They differ from each other in that the CO_2 particles sublime during and after impact and the ice particles melt. Thus, the two demonstrations provide important information about two strong candidate decontamination methodologies. Each process was tested at ORNL using contaminated lead bricks and contaminated tools and equipment. Demonstrations with the prototype Crystalline Ice Blast and the CO_2 Cleanblast systems showed that paint, grease, and oil can be removed from metal, plastic, asphalt, and concrete surfaces. Furthermore, removal of contamination from lead bricks was highly effective. Both processes were found to be less effective, under the conditions tested, with contaminated tools and equipment that had chemically bonded contamination or contamination located in crevices since neither technology abrades the substrates or penetrates deeply into crevices to remove particulates. Some process improvements are recommended.

15180 (PNL–10422) **Geology, hydrology, chemistry, and microbiology of the in situ bioremediation demonstration site.** Newcomer, D.R.; Doremus, L.A.; Hall, S.H.; Truex, M.J.; Vermeul, V.R.; Engelman, R.E. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 111p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95008896. Source: OSTI; NTIS; INIS; GPO Dep.

This report summarizes characterization information on the geology, hydrology, microbiology, contaminant distribution, and

ground-water chemistry to support demonstration of in situ bioremediation at the Hanford Site. The purpose of this information is to provide baseline conditions, including a conceptual model of the aquifer being utilized for in situ bioremediation. Data were collected from sampling and other characterization activities associated with three wells drilled in the upper part of the suprabasalt aquifer. Results of point-dilution tracer tests, conducted in the upper 9 m (30 ft) of the aquifer, showed that most ground-water flow occurs in the upper part of this zone, which is consistent with hydraulic test results and geologic and geophysical data. Other tracer test results indicated that natural ground-water flow velocity is equal to or less than about 0.03 m/d (0.1 ft/d). Laboratory hydraulic conductivity measurements, which represent the local distribution of vertical hydraulic conductivity, varied up to three orders of magnitude. Based on concentration data from both the vadose and saturated zone, it is suggested that most, if not all, of the carbon tetrachloride detected is representative of the aqueous phase. Concentrations of carbon tetrachloride, associated with a contaminant plume in the 200-West Area, ranged from approximately 500 to 3,800 μg/L in the aqueous phase and from approximately 10 to 290 μg/L in the solid phase at the demonstration site. Carbon tetrachloride gas was detected in the vadose zone, suggesting volatilization and subsequent upward migration from the saturated zone.

15181 (PNL-SA–25063) **A systematic approach for future solid waste cleanup activities at the Hanford Site.** Dirks, L.L. (Pacific Northwest Lab., Richland, WA (United States)); Konynenbelt, H.S.; Hladek, K.L. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950216–83: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008958. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes the systematic approach to the treatment, storage, and disposal system (TSD) planning and management that has been developed and implemented by Hanford's Solid Waste Program. The systematic approach includes: collecting the forecast and waste inventory data; defining Hanford's TSD system; studying and refining the TSD system by using analysis tools; and documenting analysis results. The customers responsible for planning, funding, and managing future solid waste activities have driven the evolution of the solid waste system. Currently, all treatment facilities are several years from operating. As these facilities become closer to reality, more detailed systems analysis and modeling will be necessary to successfully remediate solid waste at the Site. The tools will continue to be developed in detail to address the complexities of the system as they become better defined. The tools will help determine which facility lay-outs are most optimal, will help determine what types of equipment should be used to optimize the transport of materials to and from each TSD facility, and will be used for performing life-cycle analysis. It is envisioned that in addition to developing the tools to be adapted to the more specific facility design issues, this approach will also be used as an example for other waste installations across the DOE complex.

15182 (PNL-SA–25864) **The value of adding regional to local stakeholder involvement in evaluating the acceptability of innovative technologies.** Peterson, T.S. (Pacific Northwest Lab., Richland, WA (United States)); McCabe, G.; Niesen, K.; Serie, P. Pacific Northwest Lab., Richland, WA (United States). Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950216–116: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008937. Source: OSTI; NTIS; INIS; GPO Dep.

Technology is urgently needed to clean up contamination by volatile organic compounds at United States Department of Energy (DOE) sites. In many cases, however, existing technology is too slow, inefficient, or expensive. The record of technology development is, in some cases, similarly disappointing. Remediation technologies developed at great expense and evaluated piecemeal over long periods have not been deployed because, in the end, the public judged them ineffective or unacceptable. The need for successful methods of remediation is too great and resources too limited to continue with ineffective technology evaluation. In order to make good decisions about which technologies to deploy, remedial project managers need to know stakeholders' requirements for the performance of proposed technologies. Expanding stakeholder involvement regionally identifies the concerns of a broad range of stakeholders at and DOE sites throughout the West – issues that must be taken into account if technologies are to be accepted for wide deployment.

15183 (RFP–4939) **Potassium ferrate treatment of RFETS' contaminated groundwater.** USDOE Rocky Flats Office, Golden, CO (United States). Jan 1995. 237p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC34-90DP62349. Order Number DE95009019. Source: OSTI; NTIS; INIS; GPO Dep.

The potassium ferrate treatment study of Rocky Flats Environmental Technology Site (RFETS) groundwater was performed under the Sitewide Treatability Studies Program (STSP). This study was undertaken to determine the effectiveness of potassium ferrate in a water treatment system to remove the contaminants of concern (COCS) from groundwater at the RFETS. Potassium ferrate is a simple salt where the iron is in the plus six valence state. It is the iron at the plus six valence state (Fe^{+6}) that makes it an unique water treatment chemical, especially in waters where the pH is greater than seven. In basic solutions where the solubility of the oxides/hydroxides of many of the COCs is low, solids are formed as the pH is raised. By using ferrate these solids are agglomerated so they can be effectively removed by sedimentation in conventional water treatment equipment. The objective of this study was to determine the quality of water after treatment with potassium ferrate and to determine if the Colorado Water Quality Control Commission (CWQCC) discharge limits for the COCs listed in Table 1.0-1 could be met. Radionuclides in the groundwater were of special concern.

15184 (UCRL-JC–110903) **Accounting for predictive uncertainty in a risk analysis focusing on radiological contamination of groundwater.** Andricevic, R. (Desert Research Institute, Las Vegas, NV (United States)); Jacobson, R.L.; Daniels, J.I. Lawrence Livermore National Lab., CA (United States). Dec 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-9309481–1: International commission on groundwater of the International Association of Hydrological Science, Tallinn (Estonia), 6-9 Sep 1993). Order Number DE95009877. Source: OSTI; NTIS; INIS; GPO Dep.

This study focuses on the probabilistic travel time approach for predicting transport of radionuclides by groundwater velocity considering parameter uncertainty. The principal entity in the presented model is a travel time probability density function (pdf) conditioned on the set of parameters used to describe different transport processes like advection, dispersion, sorption, and decay. The model is applied to predict the arrival time of radionuclides in groundwater from the Nevada Test Site (NTS) at possible locations of potential human receptors nearby. Because of the lack of sorption the Tritium is found to provide the largest risk. Inclusion of sorption processes indicate that the parameter uncertainty and especially negative correlation between the mean velocity and the sorption strength is instrumental in evaluating the radionuclides arrival time at the prespecified accessible environment. Our analysis of potential health risks takes into consideration uncertainties in physiological attributes, as well as in committed effective dose and the estimate of physical detriment per unit Committed Effective Dose.

15185 (UCRL-JC–118795) **Risk from a compressed toxic gas system: Part 1, Dispersal probability.** Altenbach, T.J.; Brereton, S.J. Lawrence Livermore National Lab., CA (United States). 13 Feb 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950740–22: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95009532. Source: OSTI; NTIS; GPO Dep.

At the Lawrence Livermore National Laboratory, we have prepared a Safety Analysis Report for the Department of Energy on our Building 332 Plutonium Handling Facility. This SAR includes an analysis of potential accident scenarios which could lead to offsite consequences to the public having not only radiological exposures, but also exposures to toxic gases such as chlorine. This paper presents a risk analysis of pressurized chlorine gas system proposed for use at Building 332. The focus of the analysis is to

calculate the predicted frequency of an unmitigated leak of chlorine from the system which could result in the dispersal of the entire contents of the gas cylinder to the environment. Modeled are postulated valve leaks or pipe ruptures occurring anywhere in the distribution system, as well as the potential failure of leak mitigation. The fundamental credibility of this type of accident is established. The importance of a reliable leak mitigation system is demonstrated, and the dependence of the results on less than optimal data is discussed in the context of uncertainty and sensitivity analyses.

15186 (WHC-EP–0848) **Preliminary Hanford technical input for the Department of Energy programmatic spent nuclear fuel management and Idaho National Engineering Laboratory environmental restoration and waste management programs environmental impact statement.** Bergsman, K.H. Westinghouse Hanford Co., Richland, WA (United States). Mar 1995. 113p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008792. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is currently evaluating its programmatic options for the safe management of its diverse spent nuclear fuel (SNF) inventory in the Department of Energy Programmatic Spent Nuclear Fuel Management and Idaho National Engineering Laboratory Environmental Restoration and Waste Management Programs Environmental Impact Statement (SNF and INEL EIS). In the SNF and INEL EIS, the DOE is assessing five alternatives for SNF management, which consider at which of the DOE sites each of the various SNF types should be managed until ultimate disposition. The range of SNF inventories considered for management at the Hanford Site in the SNF and INEL EIS include the current Hanford Site inventory, only the current Hanford Site defense production SNF inventory, the DOE complex-wide SNF inventory, or none at all. Site-specific SNF management decisions will be evaluated in separate National Environmental Policy Act evaluations. Appendixes A and B include information on (1) additional facilities required to accommodate inventories of SNF within each management alternative, (2) existing and new SNF management facility descriptions, (3) facility costs for construction and operation, (4) facility workforce requirements for construction and operation, and (5) facility discharges. The information was extrapolated from existing analyses to the extent possible. New facility costs, manpower requirements, and similar information are based on rough-order-of-magnitude estimates.

15187 (WHC-SD-CP-SA–028) **Walkdown procedure: Seismic adequacy review of safety class 3 & 4 commodities in 2736-Z & ZB buildings at PFP facility.** Ocoma, E.C. Westinghouse Hanford Co., Richland, WA (United States). 29 Mar 1995. 81p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010143. Source: OSTI; NTIS; INIS; GPO Dep.

Seismic evaluation of existing safety class (SC) 3 and non-SC 4 commodities at the Plutonium Finishing Plant (PFP) is integrated into an area walkdown program. Field walkdowns of potential PFP seismic deficiencies associated with structural failure and falling will be performed using the DOE SQUG/EPRI methodology. Potential proximity interactions are also addressed. Objective of the walkdown is to qualify as much of the equipment as practical and to identify candidates for further evaluation.

15188 (WHC-SD-EN-TI–283) **Data quality objectives for PUREX deactivation flushing.** Bhatia, R.K. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009154. Source: OSTI; NTIS; INIS; GPO Dep.

This Data Quality Objection (DQO) defines the sampling and analysis requirements necessary to support the deactivation of the Plutonium-Uranium Extraction (PUREX) facility vessels that are regulated by WAC 173-303. Specifically, sampling and analysis requirements are identified for the flushing operations that are a major element of PUREX deactivation.

15189 (WHC-SD-GN-QAPP–001-Rev.1) **Quality assurance program plan for the Site Physical and Electrical Calibration Services Lab. Revision 1.** Carpenter, C.A. Westinghouse Hanford Co., Richland, WA (United States). 2 Mar 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008466. Source: OSTI; NTIS; INIS; GPO Dep.

This Quality Assurance Program Plan (QAPP) is organized to address WHC's implementation of quality assurance requirements as they are presented as interpretive guidance endorsed by the Department of Energy (DOE) Field Office, Richland DOE Order 5700.6C Quality Assurance. The quality assurance requirements presented in this plan will assure Measuring and Test Equipment (M and TE) are in conformance with prescribed technical requirements and that data provided by testing, inspection, or maintenance are valid. This QAPP covers all activities and work elements that are variously called QA, quality control, and quality engineering regardless of the organization performing the work. This QAPP identifies the QA requirements for planning, control, and documentation of operations, modifications, and maintenance of the WHC Site Physical and Electrical Calibration Services Laboratory. The primary function of the WHC Site Physical and Electrical Calibration Services Laboratory is providing calibration, standardization, or repair service of M and TE.

15190 (WHC-SD-SNF-DRR–002-Vol.2) **Design Review Report for the 105 K-East Basin dose reduction concept, Volume 2, Review Package.** Dearing, J.I. Westinghouse Hanford Co., Richland, WA (United States). 28 Mar 1995. 379p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010133. Source: OSTI; NTIS; INIS; GPO Dep.

Radiological surveys in the 105 K-East Fuel Storage Basin show average dose rates of 4 to 50 mrem/hr. A major source of the dose is the radionuclides that have been absorbed into the concrete wall of the basin. This report documents the design review of the concept for reducing the dose from the walls. Volume 1 comprises Design Review Report and Volume 2 comprises the Design Review Package.

15191 (WHC-SD-SNF-HC–002-Rev.1) **Hazard categorization of 100K East and 100K West in-basin fuel characterization program activities. Revision 1.** Alwardt, L.D. Westinghouse Hanford Co., Richland, WA (United States). 28 Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008472. Source: OSTI; NTIS; INIS; GPO Dep.

This report provides a hazard categorization of the 105 K East and 105 K West in-basin activities associated with the fuel sampling and transport preparations. It is limited to those characterization activities performed in the 105 KE and 105 KW fuel storage basin structures. The methodology of DOE standard DOE-STD-10227-92 is used. The report documents the determination that the in-basin activities associated with the fuel characterization program are classified as Hazard Category 3 (hazard analysis shows the potential for only significant localized consequences).

15192 (WHC-SD-WM-AP–005-Rev.5) **Single-shell tank leak emergency pumping guide. Revision 5.** Wiggins, D.D. Westinghouse Hanford Co., Richland, WA (United States). 4 Oct 1994. 56p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95005626. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides general information on all Single-Shell Tank Farms about readiness and special concerns for Emergency Pumping and identifies the required actions when a Single-Shell tank is identified as a leaking tank. Tank Transfer Routes are described, possible heat trace circuits are outlined, and tank riser status and obstructions are documented. Locations of existing saltwell systems and spares, information on emergency pumping equipment, watch list tank status, and transfer line integrity assessments are all included. A matrix of required actions to emergency pump individual tanks, and lists of useful drawings, procedures, work procedure outlines, and references are also provided.

15193 (WHC-SD-WM-ATR–112) **Acceptance test report for the Westinghouse 100 ton hydraulic trailer.** Barrett, R.A. Westinghouse Hanford Co., Richland, WA (United States). 6 Mar 1995.

108p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008807. Source: OSTI; NTIS; INIS; GPO Dep.

The SY-101 Equipment Removal System 100 Ton Hydraulic Trailer was designed and built by KAMP Systems, Inc. Performance of the Acceptance Test Procedure at KAMP's facility in Ontario, California (termed Phase 1 in this report) was interrupted by discrepancies noted with the main hydraulic cylinder. The main cylinder was removed and sent to REMCO for repair while the trailer was sent to Lampson's facility in Pasco, Washington. The Acceptance Test Procedure was modified and performance resumed at Lampson (termed Phase 2 in this report) after receipt of the repaired cylinder. At the successful conclusion of Phase 2 testing the trailer was accepted as meeting all the performance criteria specified.

15194 (WHC-SD-WM-CMD–001) **Closed out Tank 241-SY-101 DACS system change request #1–100.** Gauck, G.J. Westinghouse Hanford Co., Richland, WA (United States). 7 Mar 1995. 167p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008885. Source: OSTI; NTIS; INIS; GPO Dep.

This report is a compilation of system change requests processed during the development of the Data Acquisition and Control System for the Tank 241-SY-101 hydrogen mitigation project. Tank 241-SY-101 is on the Hydrogen Watch List. The disposition of the request, date the change was installed, date verified, and whether an Acceptance Test Procedure was required and completed are described for each request change.

15195 (WHC-SD-WM-HC–014) **Electrical classification for the single shell flammable gas watch list tanks.** Huckfeldt, R.A.; Anderson, R.A. Westinghouse Hanford Co., Richland, WA (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010060. Source: OSTI; NTIS; INIS; GPO Dep.

This document is to establish the hazard classification of single shell watch list tanks according to National Fire Protection Association (NFPA) criteria and sound engineering judgment. Establishing the hazard classification is necessary to determine the appropriate wiring methods and installation of electrical and mechanical equipment assure safety in an atmosphere that may be hazardous. The tanks have been placed on the flammable gas watch list because their waste types are similar to those in tanks that exhibit episodic behavior and/or unexplained growth of the waste-level height occuring over time. They contain mostly solid wastes.

15196 (WHC-SD-WM-TA–161) **Analytical services contract reform alternatives project.** Hunt, J.W.; Fox, M.R.; Kristofzski, J.G.; Minette, M.J. Westinghouse Hanford Co., Richland, WA (United States). 23 Mar 1995. 18p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010063. Source: OSTI; NTIS; GPO Dep.

Westinghouse Hanford Company (WHC) was directed by the U.S. Department of Energy, Richland Operations Office (DOE-RL) to examine the feasibility of outsourcing all or part of its laboratory and analytical functions as part of a contract reform effort. The analytical services provided by WHC were found to be significantly greater than that of a typical environmental laboratory which provides sample analysis based on a simple sample in-report out model. In addition to high-volume production analysis, the work scope includes special analytical services, technical consulting, sample handling and disposition, and special material preparations. Numerous broad ranging potential contract reform alternatives were identified and categorized into seven main alternatives with associated sub-alternatives. Issues associated with each alternative varied significantly depending on the alternative. Fifteen issues were identified and described including human resources, contract, and procurement areas. Readers of this report will perhaps identify additional alternatives and/or issues. In addressing the issues, it was determined that those issues pertaining to labor relations and procurement require major policy resolutions by WHC/DOE senior management prior to being able to establish meaningful assumptions for cost/benefit analyses of the seven alternatives. Further review was therefore stopped without economic analyses or recommendation for any specific alternative. Accordingly, this report is intended to fulfill the requirements of RL Milestone AS-95-016.

15197 (WHC-SP–0849) **Vegetation management 1994 fiscal year end report.** Rodriguez, J.M. Westinghouse Hanford Co., Richland, WA (United States). Feb 1995. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008791. Source: OSTI; NTIS; INIS; GPO Dep.

This year-end report evaluates vegetation management operations on the Hanford reservation conducted during fiscal year (FY) 1994 and proposed control methods to be used in FY 1995 and following years. The 1995 control methods proposed are based on an evaluation of past and current ALARA principles, employee safety, environmental impacts, applicable regulations, site esthetics, and other site-specific factors.

15198 (Y/EN–5289/V1) **Final report from VFL technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils: LEFPC appendices, volume 1, appendix I-IV.** Oak Ridge National Lab., TN (United States). Sep 1994. 154p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009047. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains Appendix I-IV for the pilot-scale thermal treatment of lower East Fork Poplar Creek floodplain soils. Included are calibration records; quality assurance; soils characterization; pilot scale trial runs.

15199 (Y/EN–5289/V3) **Final report from VFL Technologies for the pilot-scale thermal treatment of Lower East Fork Poplar Creek floodplain soils. LEFPC Appendices, Volume 3, Appendix V-B.** Oak Ridge Y-12 Plant, TN (United States); VFL Technology Corp., Malvern, PA (United States). Sep 1994. 534p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009195. Source: OSTI; NTIS; INIS; GPO Dep.

This report consists of appendix V-B which contains the final verification run data package. Validation of analytical data is presented for Ecotek LSI. Analytical results are included of both soil and creek bed samples for the following contaminants: metals; metals (TCLP); uranium; gross alpha/beta; and polychlorinated biphenyls.

15200 (Y/ER–159/V1) **Y-12 Plant Decontamination and Decommissioning Technology Logic Diagram for Building 9201-4. Volume 1: Technology evaluation.** Oak Ridge National Lab., TN (United States). Sep 1994. 260p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009067. Source: OSTI; NTIS; INIS; GPO Dep.

During World War 11, the Oak Ridge Y-12 Plant was built as part of the Manhattan Project to supply enriched uranium for weapons production. In 1945, Building 9201-4 (Alpha-4) was originally used to house a uranium isotope separation process based on electromagnetic separation technology. With the startup of the Oak Ridge K-25 Site gaseous diffusion plant In 1947, Alpha-4 was placed on standby. In 1953, the uranium enrichment process was removed, and installation of equipment for the Colex process began. The Colex process–which uses a mercury solvent and lithium hydroxide as the lithium feed material-was shut down in 1962 and drained of process materials. Residual Quantities of mercury and lithium hydroxide have remained in the process equipment. Alpha-4 contains more than one-half million ft^2 of floor area; 15,000 tons of process and electrical equipment; and 23,000 tons of insulation, mortar, brick, flooring, handrails, ducts, utilities, burnables, and sludge. Because much of this equipment and construction material is contaminated with elemental mercury, cleanup is necessary. The goal of the Y-12 Plant Decontamination and Decommissioning Technology Logic Diagram for Building 9201-4 is to provide a planning document that relates decontamination and decommissioning and waste management problems at the Alpha-4 building to the technologies that can be used to remediate these problems. The Y-12 Plant Decontamination and Decommissioning Technology Logic Diagram for Building 9201-4 builds on the methodology transferred by the U.S. Air Force to the Environmental Management organization with DOE and draws from previous technology logic diagram-efforts: logic diagrams for Hanford, the K-25 Site, and ORNL.

15201 (Y/ER–159/V2) **Y-12 Plant decontamination and decommissioning technology logic diagram for Building 9201-4. Volume 2: Technology logic diagram.** Oak Ridge K-25 Site, TN (United States). Sep 1994. 383p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009196. Source: OSTI; NTIS; INIS; GPO Dep.

The Y-12 Plant Decontamination and Decommissioning Technology Logic Diagram for Building 9201-4 (TLD) was developed to provide a decision-support tool that relates decontamination and decommissioning (D and D) problems at Bldg. 9201-4 to potential technologies that can remediate these problems. This TLD identifies the research, development, demonstration, testing, and evaluation needed for sufficient development of these technologies to allow for technology transfer and application to D and D and waste management (WM) activities. It is essential that follow-on engineering studies be conducted to build on the output of this project. These studies will begin by selecting the most promising technologies identified in the TLD and by finding an optimum mix of technologies that will provide a socially acceptable balance between cost and risk. The TLD consists of three fundamentally separate volumes: Vol. 1 (Technology Evaluation), Vol. 2 (Technology Logic Diagram), and Vol. 3 (Technology Evaluation Data Sheets). Volume 2 contains the logic linkages among environmental management goals, environmental problems, and the various technologies that have the potential to solve these problems. Volume 2 has been divided into five sections: Characterization, Decontamination, Dismantlement, Robotics/Automation, and Waste Management. Each section contains logical breakdowns of the Y-12 D and D problems by subject area and identifies technologies that can be reasonably applied to each D and D challenge.

15202 (Y/ER–159/V3/Pt.A) **Y-12 Plant decontamination and decommissioning technology logic diagram for Building 9201-4. Volume 3: Technology evaluation data sheets; Part A: Characterization, dismantlement.** Oak Ridge K-25 Site, TN (United States). Sep 1994. 412p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009068. Source: OSTI; NTIS; INIS; GPO Dep.

The Y-12 Plant Decontamination and Decommissioning Technology Logic Diagram for Building 9201-4 (TLD) was developed to provide a decision-support tool that relates decontamination and decommissioning (D and D) problems at Bldg. 9201-4 to potential technologies that can remediate these problems. The TLD uses information from the Strategic Roadmap for the Oak Ridge Reservation, the Oak Ridge K-25 Site Technology Logic Diagram, the Oak Ridge National Laboratory Technology Logic Diagram, and a previous Hanford logic diagram. This TLD identifies the research, development, demonstration, testing, and evaluation needed for sufficient development of these technologies to allow for technology transfer and application to D and D and waste management (WM) activities. It is essential that follow-on engineering studies be conducted to build on the output of this project. These studies will begin by selecting the most promising technologies identified in the TLD and by finding an optimum mix of technologies that will provide a socially acceptable balance between cost and risk. This report consists of the characterization and dismantlement data sheets.

15203 (Y/ER–159/V3/Pt.B) **Y-12 Plant decontamination and decommissioning technology logic diagram for Building 9201-4. Volume 3: Technology evaluation data sheets; Part B: Decontamination, robotics/automation, waste management.** Oak Ridge K-25 Site, TN (United States). Sep 1994. 404p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009069. Source: OSTI; NTIS; INIS; GPO Dep.

The Y-12 Plant Decontamination and Decommissioning Technology Logic Diagram for Building 9201-4 (TLD) was developed to provide a decision-support tool that relates decontamination and decommissioning (D and D) problems at Bldg. 9201-4 to potential technologies that can remediate these problems. The TLD uses information from the Strategic Roadmap for the Oak Ridge Reservation, the Oak Ridge K-25 Site Technology Logic Diagram, the Oak Ridge National Laboratory Technology Logic Diagram, and a previous Hanford logic diagram. This TLD identifies the research, development, demonstration, testing, and evaluation needed for sufficient development of these technologies to allow for technology transfer and application to D and D and waste management (WM) activities. It is essential that follow-on engineering studies be conducted to build on the output of this project. These studies will begin by selecting the most promising technologies identified in the TLD and by finding an optimum mix of technologies that will provide a socially acceptable balance between cost and risk. This report consists of the decontamination, robotics/automation, and WM data sheets.

15204 (Y/ER–210) **Decision document for performing a long-term pumping test at the S-3 Site, Oak Ridge Y-12 Plant, Oak Ridge, Tennessee.** Oak Ridge Y-12 Plant, TN (United States); Science Applications International Corp., Oak Ridge, TN (United States). Feb 1995. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009197. Source: OSTI; NTIS; INIS; GPO Dep.

One of the principal problems confronting the remediation of Bear Creek Valley is the cleanup of contaminated groundwater. The S-3 Site is one of the locations in the valley where groundwater is most contaminated, and contamination from the S-3 Site has also caused extensive contamination of downgradient groundwater. This groundwater plume, therefore, has a high priority in the Bear Creek Valley remedial process. Pumping and treating groundwater was identified early in the feasibility study as a likely remedial alternative for the S-3 Site groundwater plume. The hydrology and geochemistry of the plume are extremely complex. There is a high degree of uncertainty in the current understanding of how the aquifer will react physically and chemically to pumping, making evaluation of a pump-and-treat alternative impractical at the present time. Before a pump-and-treat alternative can be evaluated, its technical practicability, effectiveness, and projected cost must be determined. A long-term pumping test (LTPT) at the S-3 Site has been proposed so that the information necessary to carry out this evaluation can be collected. This document constitutes the first phase in the planning process for this test.

15205 (Y/ER/SUB–91-ALV96/6-Rev.2) **Post-closure permit application for the Upper East Fork Poplar Creek hydrogeologic regime at the Y-12 Plant: New Hope Pond and Eastern S-3 ponds plume. Revision 2.** Oak Ridge Y-12 Plant, TN (United States); Geraghty and Miller, Inc., Oak Ridge, TN (United States). Feb 1995. 427p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009519. Source: OSTI; NTIS; INIS; GPO Dep.

The intent of this Post-Closure, Permit Application (PCPA) is to satisfy the post-closure permitting requirements of the Tennessee Department of Environment and Conservation (TDEC) Rule 1200-1-11. This application is for the entire Upper East Fork Poplar Creek Hydrogeologic Regime (East Fork Regime), which is within the Bear Creek Valley (BCV). This PCPA has been prepared to include the entire East Fork Regime because, although there are numerous contaminant sources within the regime, the contaminant plumes throughout the East Fork Regime have coalesced and can no longer be distinguished as separate plumes. This PCPA focuses on two recognized Resource Conservation and Recovery Act (RCRA) interim status units: New Hope Pond (NHP) and the eastern S-3 Ponds plume. This PCPA presents data from groundwater assessment monitoring throughout the regime, performed since 1986. Using this data, this PCPA demonstrates that NHP is not a statistically discernible source of groundwater contaminants and that sites upgradient of NHP are the likely sources of groundwater contamination seen in the NHP vicinity. As such, this PCPA proposes a detection monitoring program to replace the current assessment monitoring program for NHP.

15206 (Y/SUB–94-99069C(Y13)/2) **Fiscal Year 1993 Well Plugging and Abandonment Program Summary Report Y-12 Plant, Oak Ridge, Tennessee.** Oak Ridge National Lab., TN (United States). Sep 1994. 459p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009187. Source: OSTI; NTIS; GPO Dep.

This report is a synopsis of the progress of the well plugging and abandonment program at the Y-12 Plant, Oak Ridge, Tennessee, from October 1993 through August 1994. A total of 57 wells and borings were plugged and abandoned during the period of time

covered in this report. All wells and borings were plugged and abandoned in accordance with the Monitoring Well Plugging and Abandonment Plan for the U.S. Department of Energy, Y-12 Plant, Oak Ridge, Tennessee.

0550 Safeguards, Inspection, and Accountability

15207 (AEC–95010509) **Oak Ridge Operations nuclear materials management program handbook.** USAEC Oak Ridge Operations Office, TN (United States). Aug 1974. 76p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010509. Source: OSTI; NTIS; GPO Dep.

Purpose of this handbook is to provide guidance for management of nuclear materials under the jurisdiction of the Oak Ridge Operations Office. Provisions of this handbook and amplifying instructions by the OR Materials Management Division apply to all OR license-exempt contractors who possess nuclear materials and to licensed contractors processing Government-furnished material. Materials covered are U-233, uranium (depleted, normal, enriched in U-235), plutonium, Pu-238, tritium, deuterium, and boron-10.

15208 (LA–12918-MS) **The safeguards options study.** Hakkila, E.A. (Los Alamos National Lab., NM (United States)); Mullen, M.F.; Olinger, C.T.; Stanbro, W.D.; Olsen, A.P.; Roche, C.T.; Rudolph, R.R.; Bieber, A.M.; Lemley, J.; Filby, E. Los Alamos National Lab., NM (United States). Apr 1995. 168p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009023. Source: OSTI; NTIS; INIS; GPO Dep.

The Safeguards Options Study was initiated to aid the International Safeguards Division (ISD) of the DOE Office of Arms Control and Nonproliferation in developing its programs in enhanced international safeguards. The goal was to provide a technical basis for the ISD program in this area. The Safeguards Options Study has been a cooperative effort among ten organizations. These are Argonne National Laboratory, Brookhaven National Laboratory, Idaho National Engineering Laboratory, Lawrence Livermore National Laboratory, Los Alamos National Laboratory, Mound Laboratory, Oak Ridge National Laboratory, Pacific Northwest Laboratories, Sandia National Laboratories, and Special Technologies Laboratory. Much of the Motivation for the Safeguards Options Study is the recognition after the Iraq experience that there are deficiencies in the present approach to international safeguards. While under International Atomic Energy Agency (IAEA) safeguards at their declared facilities, Iraq was able to develop a significant weapons program without being noticed. This is because negotiated safeguards only applied at declared sites. Even so, their nuclear weapons program clearly conflicted with Iraq's obligations under the Nuclear Nonproliferation Treaty (NPT) as a nonnuclear weapon state.

15209 (LA–12935-MS) **Proliferation resistance criteria for fissile material disposition.** Close, D.A. (Los Alamos National Lab., NM (United States)); Fearey, B.L.; Markin, J.T.; Rutherford, D.A.; Duggan, R.A.; Jaeger, C.D.; Mangan, D.L.; Moya, R.W.; Moore, L.R.; Strait, R.S. Los Alamos National Lab., NM (United States). Apr 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009021. Source: OSTI; NTIS; INIS; GPO Dep.

The 1994 National Academy of Sciences study "Management and Disposition of Excess Weapons Plutonium" defined options for reducing the national and international proliferation risks of materials declared excess to the nuclear weapons program. This report proposes criteria for assessing the proliferation resistance of these options. The criteria are general, encompassing all stages of the disposition process from storage through intermediate processing to final disposition including the facilities, processing technologies and materials, the level of safeguards for these materials, and the national/subnational threat to the materials.

15210 (LA-UR–95-1039) **Misuse and intrusion detection at Los Alamos National Laboratory.** Jackson, K.A.; Neuman, M.C.; Simmonds, D.D.; Stallings, C.A.; Thompson, J.L.; Christoph, G.G. Los Alamos National Lab., NM (United States). [1995]. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505191–1: 17. Department of Energy computer security group training conference, Milwaukee, WI (United States), 1-4 May 1995). Order Number DE95009413. Source: OSTI; NTIS; GPO Dep.

An effective method for detecting computer misuse is the automatic auditing and analysis of on-line user activity. This activity is reflected in system audit records, in system vulnerability postures, and in other evidence found through active system testing. Since 1989 we have implemented a misuse and intrusion detection system at Los Alamos. This is the Network Anomaly Detection and Intrusion Reporter, or NADIR. NADIR currently audits a Kerberos distributed authentication system, file activity on a mass, storage system, and four Cray supercomputers that run the UNICOS operating system. NADIR summarizes user activity and system configuration in statistical profiles. It compares these profiles to expert rules that define security policy and improper or suspicious behavior. It reports suspicious behavior to security auditors and provides tools to aid in follow-up investigations, As NADIR is constantly evolving, this paper reports its development to date.

15211 (NUREG–0430-Vol.14) **Licensed fuel facility. Volume 14. Inventory difference data, status report, July 1, 1993–June 30, 1994.** Joy, D.R. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Material Safety and Safeguards. Mar 1995. 14p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

The Nuclear Regulatory Commission is committed to an annual publication of licensed fuel facilities' inventory difference (ID) results, after Agency review of the information and completion of any related investigations. Information in this report includes ID results for active fuel fabrication and/or recovery facilities.

15212 (UCRL-ID–119816) **A human engineering and ergonomic evaluation of the security access panel interface.** Hartney, C.; Banks, W.W. Lawrence Livermore National Lab., CA (United States). Feb 1995. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010210. Source: OSTI; NTIS; INIS; GPO Dep.

The purpose of this study was to empirically determine which of several security hardware interface designs produced the highest levels of end-user performance and acceptance. The FESSP Security Alarms and Monitoring Systems program area commissioned the authors study as decision support for upgrading the Argus security system's primary user interface so that Argus equipment will support the new DOE and DoD security access badges. Twenty-two test subjects were repeatedly tested using six remote access panel (RAP) designs. Lawrence Livermore National Laboratory (LLNL) uses one of these interface designs in its security access booths. Along with the RAP B insert-style reader, the authors tested five prototype RAP variants, each with a different style of swipe badge reader, through which a badge is moved or swiped. The authors asked the untrained test subjects to use each RAP while they described how they thought they should respond so that the system would operate correctly in reading the magnetic strip on a security badge. With each RAP variant, subjects were required to make four successful card reads (swipes) in which the card reader correctly read and logged the transaction. After each trial, a subject completed a 10-item interface acceptance evaluation before approaching the next RAP. After interacting with the RAP interfaces (for a total of the six RAP trials), each subject completed a 7-item overview evaluation that compared and ranked the five experimental RAPs, using the original (RAP B) insert style as a standard.

15213 (Y/DW–1351) **A Continuous Automated Vault Inventory System (CAVIS) for accountability monitoring of stored nuclear materials.** Pickett, C.A. (and others); Barham, M.A.; Gafford, T.A.; Hutchinson, D.P.; Jordan, J.K.; Maxey, L.C.; Moran, B.W.; Muhs, J.; Nodine, R.; Simpson, M.L. Oak Ridge National Lab., TN (United States). 8 Dec 1994. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009051. Source: OSTI; NTIS; INIS; GPO Dep.

Nearly all facilities that store hazardous (radioactive or nonradioactive) materials must comply with prevailing federal, state,

and local laws. These laws usually have components that require periodic physical inspections to insure that all materials remain safely and securely stored. The inspections are generally labor intensive, slow, put personnel at risk, and only find anomalies after they have occurred. The system described in this paper was developed for monitoring stored nuclear materials resulting from weapons dismantlement, but its applications extend to any storage facility that meets the above criteria. The traditional special nuclear material (SNM) accountability programs, that are currently used within most of the Department of Energy (DOE) complex, require the physical entry of highly trained personnel into SNM storage vaults. This imposes the need for additional security measures, which typically mandate that extra security personnel be present while SNM inventories are performed. These requirements increase labor costs and put additional personnel at risk to radiation exposure. In some cases, individuals have received radiation exposure equivalent to the annual maximum during just one inventory verification. With increasing overhead costs, the current system is rapidly becoming too expensive to operate, the need for an automated method of inventory verification is evident. The Continuous Automated Vault Inventory System (CAVIS) described in this paper was designed and prototyped as a low cost, highly reliable, and user friendly system that is capable of providing, real-time weight, gamma. and neutron energy confirmation from each item stored in a SNM vault. This paper describes the sensor technologies, the CAVIS prototype system (built at Y- 12 for highly enriched uranium storage), the technical requirements that must be achieved to assure successful implementation, and descriptions of sensor technologies needed for a plutonium facility.

15214 (ECE/ENVWA–32(add.1)) **Bilateral and multilateral agreements and other arrangements in Europe and North America on the protection and use of transboundary waters. Addendum. 1994 Update.** United Nations Economic Commission for Europe (ECE), Geneva (Switzerland). 23 Jan 1995. 10p. Order Number DE95628138. Source: OSTI; NTIS (US Sales Only); INIS.

The present document is issued pursuant to the decision taken by the Committee on Environmental Policy at its first session (ECE/CEP/1) to revise and update annually the 1993 list of Bilateral and Multilateral Agreements and Other Arrangements in Europe and North America on the Protection and Use of Transboundary Waters (ECE/ENVWA/32) and to publish a completely revised and updated version of the consolidated list of agreements at three-yearly intervals. By 31 December 1994, additions and amendments to this document had been submitted by the delegations of Austria, Croatia, Netherlands, Russian Federation and Slovakia. These have been incorporated into the present document.

15215 (INIS-mf–14508) **Radiation protection code of practice.** Ministry of Energy and Mineral Resources, Amman (Jordan). 1995. 110p. (In Arabic). Order Number DE95628139. Source: OSTI; NTIS (US Sales Only); INIS.

A collection of legal and regulatory material governing Jordan's radiation protection activities. The full text of Jordan's Nuclear Energy and Radiation Protection Law (No. 14 for 1987) is given, along with relevant regulations which are enforced in Jordan. The regulations cover the areas of shielding radiology rooms, defining radiation work, decontamination in the event of laboratory scale radiological accidents, radioactive waste disposal, personnel dosimetry, assigning radiation protection officers, licensing, and inspection. (A.M.H.). 12 tabs., 6 figs.

15216 (NEI-DK–1901) **Statement concerning the transport of radioactive materials during the year 1994.** Statens Inst. for Straalehygiejne, Broenshoej (Denmark). Jan 1995. 23p. (In Danish). Order Number DE95628853. Source: OSTI; NTIS; INIS.

An account of the use and transport of radioactive materials in Denmark and of the relevant regulations insofar as there have been changes in connection with those mentioned in the similar statement published for 1993. During 1994, after an interval of six years, Risoe National Laboratory has arranged for the transport of spent nuclear fuels from the research reactor designated DR3 to USA. This transportation and transportations from three other European research reactors by ships registered in Denmark are described in some detail. Inspection and control, especially with regard to the transport to USA of spent reactor fuels from DR3, international and national cooperation in this field, the European Union, the International Atomic Energy Agency (IAEA), the Nordic transport group and the Danish contact committee are dealt with in addition to the extent of transport of radioactive materials, and connected accidents and radiation doses. (AB).

15217 (PNRI-F(SI)–91001) **Safety regulations of radiation sources in industry in the Philippines.** Borras, A.M. (Licensing and Evaluation Section, Nuclear Regulations Licensing and Safeguards Division, Philippine Nuclear Research Institute, Diliman, Quezon City (Philippines)). Philippine Nuclear Research Inst., Diliman, Quezon City (Philippines). 1991. [16p.] Order Number DE95627091. Source: OSTI; NTIS (US Sales Only); INIS.

Country report presented at the Regional (RCA) Training Course on Safety Aspects in the Industrial Applications of Radiation Sources, Bombay, India, 2-13 December 1991.

The Philippine Nuclear Research Institute (PNRI) by virtue of Republic Act 2067, as amended, Republic Act 5207 and Executive Order 128 (1987), was mandated to advance and regulate the safe and peaceful applications of nuclear science and technology in the Philippines. The PNRI was formerly the Philippine Atomic Energy Commission established in 1958. This report aims to share the experiences of the PNRI on licensing and regulating the safe use of radioactive materials in industry, particularly in industrial gamma radiography, nuclear gauges and radioactive tracers. It enumerates the licensing and enforcement procedures. Some common problems encountered in the licensing and enforcement activities and comments of future plans to resolve the problems were also discussed. (Author).

07 ISOTOPE AND RADIATION SOURCE TECHNOLOGY

0701 Physical Isotope Separation

15218 (JINR–18-92-260) **Production of medical radioisotopes using JINR accelerators. Possibilities and prospects.** Dmitriev, S.N.; Zajtseva, N.G.; Oganesyan, R.Ts.; Gul'bekyan, G.G.; Onishchenko, L.M.; Khalkin, V.A. Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Reactions; Joint Inst. for Nuclear Research, Dubna (Russian Federation). Lab. of Nuclear Problems. 1992. 14p. (In Russian). Order Number DE95626738. Source: OSTI; NTIS (US Sales Only); INIS.

Prospects of using the JINR accelerators - the micrrotron MT-25, the cyclotron U-200 and the phasotron for the production of ^{97}Ru, ^{111}In, ^{123}I, ^{178}W, ^{201}Tl, ^{237}Pu and some other nuclides from various targets at different energies of accelerated ions are considered. A project of a proton cyclotron dedicated to the production of radioisotopes is discussed. 18 refs.; 5 tabs.

15219 (UCRL-ID–118139) **Investigation of the particle selectivity of a traveling potential wave; neon isotope separation with the Solitron process. Final report.** Lowder, R.S. Lawrence Livermore National Lab., CA (United States). 26 Jul 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010332. Source: OSTI; NTIS; INIS; GPO Dep.

The specific goal of this three year effort was to investigate this novel isotope separation process itself: to determine whether isotopes could indeed be separated and, if so, with what limitations–space charge effects, instabilities, and, in particular, with what throughput limitations. Termed the Solitron process, the concept is based on the strong isotopic variation in wave/ion interaction for a potential wave passing through an ion beam when the wave speed is near the ion speed. The ion's charge-to-mass ratio determines not only which ions are picked up by the wave but also the final energy of those ions that are picked up (accelerated to a

higher energy); thus, this method can be used for isotope separation. Much progress was made regarding separation and throughput, concluding that separation works well in conjunction with electrostatic focusing used to obtain enough throughput (enough beam current) to make a practical device. The next step would likely be a production device, although development of an appropriate metal ion source would be useful. Funding is an issue; development cost estimates run around two million dollars for a market only several times that cost. Although there is much concern about the future supply of isotopes such as could be produced by the Solitron process, as well as costs, at present the supply from Oak Ridge and Russian sources is adequate for US needs. Should demand grow, these LDRD studies would strongly support proposals for further development of this Solitron process and help assure its likely success. For example, a point design for a magnesium mission was formulated to obtain a consistent set of design numbers that would optimize performance without pushing any constraints seen in these studies. A similar design could be formulated for other missions (magnesium was just a convenient target).

15220 (WSRC-MS–94-0488) **Startup and Operation of a Metal Hydride Based Isotope Separation Process.** Scogin, J.H.; Poore, A.S. Westinghouse Savannah River Co., Aiken, SC (United States). 27 Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950506–7: 5. topical meeting on tritium technology in fission, fusion and isotopic applications, Ispra (Italy), 28 May - 3 jun 1995). Order Number DE95060101. Source: OSTI; NTIS; INIS; GPO Dep.

Production scale separation of tritium from other hydrogen isotopes at the Savannah River Site (SRS) in Aiken, SC, has been accomplished by several methods. These methods include thermal diffusion (1957–1986), fractional absorption (1964–1968), and cryogenic distillation (1967-present). Most recently, the Thermal Cycling Absorption Process (TCAP), a metal hydride based hydrogen isotope separation system, began production in the Replacement Tritium Facility (RTF) on April 9, 1994. TCAP has been in development at the Savannah River Technology Center since 1980. The production startup of this semi-continuous gas chromatographic separation process is a significant accomplishment for the Savannah River Site and was achieved after years of design, development, and testing.

15221 (ENEA-RT-AMB–92-31) **Characterization of extrapolation chamber as measurement scale for beta radiations and implementation of irradiation equipment for dosimeter calibration.** Fantuzzi, E. (ENEA, Bologna (Italy). Area Energia Ambiente e Salute); Monteventi, F. ENEA, Bologna (Italy). Area Energia Ambiente e Salute. Nov 1993. 36p. (In Italian). (RT/AMB–92-31). Order Number DE95771051. Source: OSTI; NTIS (US Sales Only).

A computerized system for beta dosimetry has been developed at the Divisione di Metrologia e Protezione delle Radiazioni Ionizzanti dell'ENEA Italian Agency for (New Technologies, Energy and Environment)di Bologna. The system allows an absolute measurement of superficial dose rate in tissue using an extrapolation chamber. After extrapolation chamber calibration, the system was validated using a $^{90}Sr+^{90}Y$ beta source. All experimental equipments and experimental data including all measured value corrections are described and specified. The dose rate Dt(0)has been determined with an uncertainty <2%. Finally, the values for different calibration distances of Dt(0) have been compared with the expected values with reference to the source calibration realized by PTB (Physikalisch Technische Bundesanstalt). Values agree within 1,5%.

15222 (INIS-JP–029, pp. 122-124) **Characterization of copper thin films prepared by metal self-ion beam sputter deposition.** Gotoh, Yasuhito (Kyoto Univ. (Japan). Faculty of Engineering); Amioka, Takao; Tsuji, Hiroshi; Ishikawa, Junzo. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

New deposition technique, 'metal-ion beam self-sputtering' method has been developed. Using metal ions which is the same element with the target material, no contamination with noble gas atoms, which are often used in the conventional sputtering, will occur. In this paper, fundamental measurement of the film purity is reported. As a result of PIXE measurements, it was clarified that only slight amount of iron is incorporated in the films. (author).

15223 (JINR-E–3-94-128, pp. 6-7) **Development of high-efficiency moderators for pulsed neutron sources.** Watanabe, N.; Kiyanagi, Y. 15230 (DOE/SF/18852-T50) **GPHS-RTGs in support of the Cassini RTG Program. Semi annual technical progress report, September 26, 1994-April 2, 1995.** Martin Marietta Astro Space, Philadelphia, PA (United States). 20 Apr 1995. 73p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-91SF18852. Order Number DE95010306. Source: OSTI; NTIS; INIS; GPO Dep.

The technical progress achieved during the period 26 September 1994 through 2 April 1995 on Contract DE-AC03-91SF18852 Radioisotope Thermoelectric Generators and Ancillary Activities is described herein. Monthly technical activity for the period 27 February 1995 through 2 April 1995 is included in this progress report. The report addresses tasks, including: spacecraft integration and liaison; engineering support; safety; qualified unicouple production; ETG Fabrication, assembly, and test; ground support equipment; RTG shipping and launch support; designs, reviews, and mission applications; project management, quality assurance, reliability, contract changes, CAGO acquisition (operating funds), and CAGO maintenance and repair; and CAGO acquisition (capital funds).

0704 Economic, Industrial, and Business Aspects

15231 (INEL-95/0048) **Markets for reactor-produced non-fission radioisotopes.** Bennett, R.G. Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Jan 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. Order Number DE95008663. Source: OSTI; NTIS; INIS; GPO Dep.

Current market segments for reactor produced radioisotopes are developed and reported from a review of current literature. Specific radioisotopes studied in is report are the primarily selected from those with major medical or industrial markets, or those expected to have strongly emerging markets. Relative market sizes are indicated. Special emphasis is given to those radioisotopes that are best matched to production in high flux reactors such as the Advanced Test Reactor (ATR) at the Idaho National Engineering Laboratory or the High Flux Isotope Reactor (HFIR) at the Oak Ridge National Laboratory. A general bibliography of medical and industrial radioisotope applications, trends, and historical notes is included.

15232 (SAND-94-3009) **Preliminary safety analysis report for the gamma irradiation facility.** Boldt, K.R.; Walker, S.A.; Olbin, M.D. Sandia National Labs., Albuquerque, NM (United States). 1 Mar 1995. 228p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95009882. Source: OSTI; NTIS; INIS; GPO Dep.

This report documents the safety analysis work performed for the Gamma Irradiation Facility (GIF) at Sandia National Laboratories (SNL), Albuquerque, New Mexico. The GIF is a new facility to be constructed at Sandia's Technical Area V, and combines the sources and capabilities of two existing irradiation facilities at the Laboratories. The analysis and content of this document meets the safety analysis report requirements of DOE Order 5480.23, "Nuclear Safety Analysis Reports." The characteristics of the facility, the site, and the operations are described and the hazards associated with operation of the facility are examined to evaluate the overall safety. A graded approach technique is employed in determining the level of detail for the analysis and documentation of the hazards associated with the facility. The analysis shows that there will be no off-site impact from operation of the GIF and that the facility can be safely operated to minimize the hazards to personnel at the site. The report concludes that operation of the GIF at SNL, presents an acceptable risk to health and safety of personnel on-site, off-site, and to the general public.

08 HYDROGEN

15233 (NREL/CP-450-4972) **Proceedings of the 1992 DOE/NREL hydrogen program review.** Rocheleau, R.E. (Univ. of Hawaii, Honolulu, HI (United States). Hawaii Natural Energy Inst.); Gao, Q.H.; Miller, E. National Renewable Energy Lab., Golden, CO (United States). Jul 1992. 290p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-9205435--: 1992 DOE/NREL hydrogen program review, Honolulu, HI (United States), 6-7 May 1992). Order Number DE92010594. Source: OSTI; NTIS; GPO Dep.

These proceedings contain 18 papers presented at the meeting. While the majority of the papers (11) had to do with specific hydrogen production methods, other papers were related to hydrogen storage systems, evaluations of and systems analysis for a hydrogen economy, and environmental transport of hydrogen from a pipeline leak.

0801 Production

15234 (BNL-61364) **The Hy-C process (thermal decomposition of natural gas): Potentially the lowest cost source of hydrogen with the least CO_2 emission.** Steinberg, M. Brookhaven National Lab., Upton, NY (United States). Dec 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95009542. Source: OSTI; NTIS; GPO Dep.

The abundance of natural gas as a natural resource and its high hydrogen content make it a prime candidate for a low cost supply of hydrogen. The thermal decomposition of natural gas by methane pyrolysis produces carbon and hydrogen. The process energy required to produce one mol of hydrogen is only 5.3% of the higher heating value of methane. The thermal efficiency for hydrogen production as a fuel without the use of carbon as a fuel, can be as high as 60%. Conventional steam reforming of methane requires 8.9% process energy per mole of hydrogen even though 4 moles of hydrogen can be produced per mole of methane, compared to 2 moles by methane pyrolysis. When considering greenhouse global gas warming, methane pyrolysis produces the least amount of CO_2 emissions per unit of hydrogen and can be totally eliminated when the carbon produced is either sequestered or sold as a materials commodity, and hydrogen is used to fuel the process. Conventional steam reforming of natural gas and CO shifting produces large amounts of CO_2 emissions. The energy requirement for non-fossil, solar, nuclear, and hydropower production of hydrogen, mainly through electrolysis, is much greater than that from natural gas. From the resource available energy and environmental points of view, production of hydrogen by methane pyrolysis is most attractive. The by-product carbon black, when credited as a saleable material, makes hydrogen by thermal decomposition of natural gas (the Hy-C process) potentially the lowest cost source of large amounts of hydrogen.

15235 (NEI-DK–1876) **Hydrogen system for the village where green research is carried out.** Yde, L. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Jul 1994. 77p. (In Danish). Contract TR-89.0345. Order Number DE95766507. Source: OSTI; NTIS.

Three engineers from Ukraine installed a 20 kW electrolysis system at the 'Nordvestjysk Folkecenter for Vedvarende Energi' (North-West Folk Centre for Renewable Energy) at Thy (Denmark). The system should be used for storing electric power from a wind turbine for three days at a time at the 'Landsbyen for Groen Forskning' (The Village where Green Research is Carried Out). On windy days water is split into oxygen and hydrogen in the electrolysis plant with the help of the electricity produced by the wind turbine. The hydrogen should be stored in a 60m^3 tank under a pressure of up to 10 bar. On less windy days the hydrogen would be used as fuel in a cogeneration plant which provides the village with electricity. The design of these systems and the way they work together are described in detail. (AB)

15236 (NEI-DK–1960) **Hydrogen upgrading.** Gang Xiao; Bjerrum, N.J. Danmarks Tekniske Univ., Lyngby (Denmark). Kemisk Lab. A. Mar 1995. 45p. Contract ENS-1443/92-0006. Order Number DE95772387. Source: OSTI; NTIS.

EFP-92.

The objective of this project is, by explorative research, to develop an electrochemical hydrogen separation device (EHS) for cost-effective hydrogen recovery from various dilute hydrogen streams. Much efforts were made in the project to optimise the manufacturing of the gas-diffusion electrodes. From the test results it can be concluded that the high-surface-area carbon black - Vulcan XC-72 - is the best support material for the catalyst. We have tried to wet-proof the carbon backing paper with different concentrations of PTFE solutions. It was found that the paper treated with 30% PTFE resulted in a optimal performance of the electrode. At this concentration the carbon paper kept its high porosity and was still wet-proof. During this project we have successfully produced the SiC matrix layer with a thickness of 0.2 mm. This is thin enough to give a internal cell resistance on only 10 mΩ (active electrode area was 25 cm^2) and still thick enough to prevent impure gases form crossing over the matrix. Large effort were made to solve the problem of catalyst poisoning by CO. The most promising method was found to be the addition of O_2 to the CO-containing feed gas. Major part of the CO in the feed gas can be oxidized to CO_2 resulting in less poisoning of the catalyst. This positive effect was well confirmed both by electrochemical half-cell measurements and by EHS measurements. The results and experiences from this work can be used to obtain high purity hydrogen from, for example, molten carbonate fuel cell anode exhaust. As a further development of the project the manufacturing and testing of a EHS stack is suggested. (au) (21 refs.)

09 BIOMASS FUELS

15237 (DOE/OR/21389–T12) **Northeast Regional Biomass Program. First–fourth quarter report, October 1, 1992–September 30, 1993.** CONEG Policy Research Center, Inc., Washington, DC (United States). Jun 1994. 147p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-83OR21389. Order Number DE95010166. Source: OSTI; NTIS; GPO Dep.

The Northeast Regional Biomass Program (NRBP) continued to work toward its objectives during the tenth year. These are: improve the effectiveness, coordination and planning capabilities of the state agencies in the region which have biomass-related responsibilities; assess the availability of biomass energy resources; provide reliable information to private companies, residential and commercial consumers, and public institutions about the potential and versatility of biomass energy sources; better understand and mitigate the environmental impacts of increased biomass energy use without stifling the region's ability to take advantage of its most abundant indigenous renewable energy resource; transfer the results of government-sponsored and private research and development to the private sector; support region-specific and interregional studies of the critical impediments to further development of biomass energy resources; and coordinate the regional program with other federal, state and regional efforts to avoid duplication and maximize the effectiveness of NRBP dollars. The technical status of 14 projects is described.

0907 Resources

15238 (ETDE-DE–86) **Biotechnology for breeding industrial rape: Characterisation and isolation of fatty acid elongases from Lunaria annua. Final report.** Schoepker, H.; Fehling, E.; Mukherjee, K.D. Bundesanstalt fuer Getreide-, Kartoffel- und Fettforschung, Muenster (Germany). Inst. fuer Biochemie und Technologie der Fette. [1995]. 96p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0319412J. Order Number DE95770121. Source: OSTI; NTIS (US Sales Only).

The present part-project of the BMFT (Federal Ministry of Research and Technology) integrated project 'Industrial Rape Biotechnology' was aimed at isolating and characterising the constituent enzymes of fatty acid elongase (acyl-CoA-elongase) that catalyse the biosynthesis of extra-long-chain fatty acids (erucic and nervonic acid). This was in preparation of cloning and transferring the responsible elongase genes to rape. The constituent enzymes of acyl-CoA elongase from lunaria annua were isolated using insights gained in preceding studies of the integrated project. The ripencing seeds of this singular crucifer synthesise erucic acid and an unusually high proportion of nervonic acid. These examinations provide the basis to studies for cloning the elongase genes and transferring them to rape. The ultimate aim is to create an industrial rape rich in erucic and nervonic acid, a reproductive raw material that would be of great interest to the chemico-technical sector. (EF)

15239 (NREL/SP–420-5570-Rev.2) **BioFacts: Fueling a stronger economy. Methanol from biomass. Revision 2.** National Renewable Energy Lab., Golden, CO (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95010302. Source: OSTI; NTIS; GPO Dep.

This informational pamphlet written by The National Renewable Energy Laboratory discusses obtaining methanol, a liquid transportation fuel, from biomass, defined as crop residues, grasses, forest residues, short-rotation tree crops, and more than half of the municipal solid waste and industrial waste streams. The biomass resource is proposed in place of fossil domestic resources such as natural gas, coal and residual oil. Advances in production, processing and pilot plant design, as well as utilization concerns and environmental advantages, are addressed.

0908 Production

15240 (ANL/ES/CP–85392) **Producing usable fuel from municipal solid waste.** Ohlsson, O.O. Argonne National Lab., IL (United States). [1995]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941210–13: Power generation conference, Orlando, FL (United States), 7-9 Dec 1994). Order Number DE95008405. Source: OSTI; NTIS; GPO Dep.

Refuse disposal is a matter of increasing concern for municipalities and state governments. As existing land-fills become filled to capacity, and new landfills become more costly to site, it has become critical to develop alternative disposal methods. Some of the refuse that is presently being landfilled has the potential to provide considerable quantities of energy and thereby replace conventional fossil fuels. Another environmental concern is the problem of the emissions associated with combustion of traditional fossil fuels. The Clean Air Act Amendments of 1990 significantly restrict the level of sulfur dioxide (SO_2) and nitrogen oxides (NO_x) emissions permissible as effluent from combustion facilities. To address both of these concerns, Argonne National Laboratory, under sponsorship of the U.S. Department of Energy (DOE), has developed a means of producing fuel from municipal solid waste that can be co-fired with coal to supplement coal supplies and reduce problematic emissions.

0909 Processing

15241 (NEI-DK–1883) **Cleaning of biogas by removal of CO_2 and H_2S using pressurized water.** Jysk Biogas, Farsoe (Denmark). [1995]. 27p. (In Danish). Contract ENS-51161-93.0041. Order Number DE95766513. Source: OSTI; NTIS.

Carbon dioxide and hydrogen sulphide should be removed from methane so that it could be used as fuel for cars or in the natural gas distribution network. Pressurized water was to be used for this process and the plant should be of simple design and inexpensive in use. A pilot plant was built and found to be effective. The design of the plant is described. Measurements showed that the pressurized water cleaning system can improve and clean the biogas resulting in methane of a high quality suitable to be used in a gas distribution network. It is reckoned that the capacity is 10 cubic meters per hour. (AB)

15242 (NEI-DK–1884) **Catalytic cleaning of gas from straw gasification. Parameter experiment.** Energiministeriets Forskningsprogram 91. Anvendelse af biomasse til energiformaal. Pedersen, K. Dansk Teknologisk Inst., Aarhus (Denmark). Miljoeteknik. Jan 1995. 143p. (In Danish). Contract ENS-1383/91-0004. Order Number DE95766512. Source: OSTI; NTIS.

EFP-91.

Various catalysts were tested in relation to different gas compositions and temperatures in order to find their modes of operation. The three types examined were a sulphidic one incorporating nickel and molybdenum on alumina, an oxidic one with chromium oxide on metal oxide and a metallic one with platinum on alumina and copper on silicate. The procedures for activation, regeneration, the operation of the catalyst systems and the process layout for the cleaning system were established. The platinum catalyst is too sensitive to the carbon monoxide in the gas for practical use. Too much carbon is produced at temperatures above 450 degrees centigrade and it is very expensive. The copper catalyst deactivates in the face of sulphur and can not be used. When temperatures are over 550 deg. cen. the rate of sintering is too high in the case of the metal oxide and sulfidic catalyst which operates best at 400-550 deg.cen. Those catalysts that are de-activated by carbon formation can be reactivated by burning up carbon compounds using recirculation of hot gas with an inlet temperature of 250 deg.cen. Here the adiabatic rise in temperature must not exceed 550 deg.cen. One of the carbon substances identified reacts at a temperature of 100-150 deg.cen, the other at 250-300 deg.cen. An activation method was developed where watery methanol with a content of 50% is added to the hot recirculation circuit. During activation of the metal oxide catalyst the consumption of methanol is ca. 45 kg per cubic meter catalyst. For the sulphidic system consumption is ca.10kg methanol and 60 kg carbon disulphide per cubic catalyst. (AB) (42 refs.)

15243 (NEI-DK–1978) **Rough delimbing of energy-trees. Felling, carting, chipping and road transport.** Skovbrugsserien, 9. Kofman, P.D; Hedsing, N.; Suadicani, K. Forskningscentret for Skov og Landskab, Lyngby (Denmark). 1994. 48p. (In Danish). Contract ENS-1383/90-0006. Order Number DE95772385. Source: OSTI; NTIS.

EFP-90.

Logging and chipping of roughly delimbed fuelwood was carried out with an adapted one-grip harvester in 5 Sitka spruce stands (one 1st, three 2nd and one 3rd thinning). At the 1st and 2nd thinning only round fuelwood was produced. At 3rd thinning short timber was also produced. The study includes logging of all stands as well as chipping at the roadside of two stands. The wood from three stands was forwarded by truck to the Maabjerg Plant and chipped there with a semi-stationary chipper. A comparison was made between chipping of ordinary three-meter pulpwood and chipping of roughly delimbed three-meter pulpwood. Time consumption and costs of producing round fuelwood are higher than the cost when trees are chipped in the stand at the place of felling. By driving the chipper into the stand the trees can be chipped with their branches. Debranching costs almost the same as chipping. Results indicate that production of round roughly delimbed fuelwood is profitable if other assortments are produced at the same time. Results of the third thinning indicate that production of round fuelwood is most profitable when the harvester and the forwarder are already in the stand to produce a more valuable assortment. This would mean use of four expensive machines in order to carry through a thinning with limited logging volume per ha. It was shown that forwarding of round roughly delimbed fuelwood is a little cheaper per unit than forwarding a chips. Likewise chipping at a plant is cheaper than chipping of piled round fuelwood at the roadside in the forest. (AB)

15244 (NREL/SP–420-5571-Rev.2) **BioFacts: Fueling a stronger economy, Biodiesel. Revision 2.** National Renewable Energy Lab., Golden, CO (United States). Jan 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95010303. Source: OSTI; NTIS; GPO Dep.

Biodiesel is a substitute for or an additive to diesel fuel that is derived from the oils and fats of plants. It is an alternative fuel that can be used in diesel engines and provides power similar to conventional diesel fuel. It is a biodegradable transportation fuel that contributes little, if any, net carbon dioxide or sulfur to the atmosphere, and is low in particulate emission. It is a renewable, domestically produced liquid fuel that can help reduce US dependence on foreign oil imports. This overview presents the resource potential, history, processing techniques, US DOE programs cost and utilization potential of biodiesel fuels.

15245 (NREL/SP–420-6379) **BioFacts: Fueling a stronger economy, Thermochemical conversion of biomass.** National Renewable Energy Lab., Golden, CO (United States). Dec 1994. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94006866. Source: OSTI; NTIS; GPO Dep.

A primary mission of the US DOE is to stimulate the development, acceptance, and use of transportation fuels made from plants and wastes called biomass. Through the National Renewable Energy Laboratory (NREL), Doe is developing and array of biomass conversion technologies that can be easily integrated into existing fuel production and distribution systems. The variety of technology options being developed should enable individual fuel producers to select and implement the most cost-effective biomass conversion process suited to their individual needs. Current DOE biofuels research focuses on the separate and tandem uses of biochemical and thermochemical conversion processes. This overview specifically addresses NREL's thermochemical conversion technologies, which are largely based on existing refining processes.

15246 (NYSERDA–95-4) **Thermal sludge dryer demonstration: Bird Island Wastewater Treatment Plant, Buffalo, NY. Final report.** New York State Energy Research and Development Authority, New York, NY (United States); Buffalo Sewer Authority, NY (United States); Nussbaumer and Clark, Inc., Buffalo, NY (United States). Jan 1995. 155p. Sponsored by New York State Energy Research and Development Authority, Albany, NY (United States). Source: OSTI; New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223 (United States).

The Buffalo Sewer Authority (BSA), in cooperation with the New York State Energy Research and Development Authority (Energy Authority), commissioned a demonstration of a full scale indirect disk-type sludge dryer at the Bird Island Wastewater Treatment Plant (BIWWTP). The purpose of the project was to determine the effects of the sludge dryer on the sludge incineration process at the facility. Sludge incineration is traditionally the most expensive, energy-intensive unit process involving solids handling at wastewater treatment plants; costs for incineration at the BIWWTP have averaged $2.4 million per year. In the conventional method of processing solids, a series of volume reduction measures, which usually includes thickening, digestion, and mechanical dewatering, is employed prior to incineration. Usually, a high level of moisture is still present within sewage sludge following mechanical dewatering. The sludge dryer system thermally dewaters wastewater sludge to approximately 26%, (and as high as 38%) dry solids content prior to incineration. The thermal dewatering system at the BIWWTP has demonstrated that it meets its design requirements. It has the potential to provide significant energy and other cost

savings by allowing the BSA to change from an operation employing two incinerators to a single incinerator mode. While the long-term reliability of the thermal dewatering system has yet to be established, this project has demonstrated that installation of such a system in an existing treatment plant can provide the owner with significant operating cost savings.

15247 (PNL–10513) **Low-temperature catalytic gasification of wet industrial wastes. FY 1993–1994 interim report.** Elliott, D.C.; Hart, T.R.; Neuenschwander, G.G.; Deverman, G.S.; Werpy, T.A.; Phelps, M.R.; Baker, E.G.; Sealock, L.J. Jr. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 41p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010205. Source: OSTI; NTIS; GPO Dep.

Process development research is continuing on a low-temperature, catalytic gasification system that has been demonstrated to convert organics in water (dilute or concentrated) to useful and environmentally safe gases. The system, licensed under the trade name Thermochemical Environmental Energy System (TEESO), treats a wide variety of feedstocks ranging from hazardous organics in water to waste sludges from food processing. The current research program is focused on the use of continuous-feed, tubular reactors systems for testing catalysts and feedstocks in the process. A range of catalysts have been tested, including nickel and other base metals, as well as ruthenium and other precious metals. Results of extensive testing show that feedstocks, ranging from 2% para-cresol in water to potato waste and spent grain, can be processed to > 99% reduction of chemical oxygen demand (COD). The product fuel gas contains from 40% up to 75% methane, depending on the feedstock. The balance of the gas is mostly carbon dioxide with < 5% hydrogen and usually < 1% ethane and higher hydrocarbons. The byproduct water stream carries residual organics from 10 to 1,000 mg/l COD, depending on the feedstock. The level of development of TEES has progressed to the initial phases of industrial process demonstration. Testing of industrial waste streams is under way at both the bench scale and engineering scale of development.

0910 Properties and Composition

15248 (SVF–530) **Comparison of different methods for the characterization of particle properties in fuel powders of wood, peat, olive stones, and coal.** Ryk, L. (SGS Sweden Solid Fuels and Minerals, Stockholm (Sweden)). Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Feb 1995. 134p. (In Swedish). Project Vaermeforsk-03-306. Order Number DE95766638. Source: OSTI; NTIS.

Figures and tables with text in English.

This report describes parallel tests to determine particle size distributions by conventional sieve-analysis, by laser diffraction and by image analysis. Specific surface was also determined. Tested material: pulverized coal and peat, dolomite powder, wood chips, milled wood chips, crushed olive stones and milled olive stones. Quite different distributions are obtained by the different methods. Especially for peat and wood chips and milled wood chips, image analysis show a much flatter particle size distribution. Thus indicating a larger portion of coarse and fine grains than shown by sieve-analysis. The importance of being able to optimize the grinding operation from a combustion-point-of-view has not been quantified. For particles like pulverized coal, laser diffraction is the most suitable method. Apart from the 'sieve-analysis' other parameters may be calculated with laser diffraction showing the importance of fine or coarse particles. Image analysis is well suited for peat, wood chips and milled wood chips. Except giving a 'sieve-analysis', image analysis may also give the distribution of various shaped grains in different fractions. Maximum and most correct information is obtained by a combination of laser diffraction and image analysis. Conventional sieve-analysis is, however, a simple and cheap way to obtain information. Although limited when biofuels and peat are screened, relative information regarding changes in size-distribution is obtained. 8 refs, 14 figs, 2 tabs, 3 appendices

15249 (TVA/LR/NRM–92/3) **A collection of wood properties. Version 1.1.** Toennisson, R.L. Tennessee Valley Authority, Norris, TN (United States). Forest Resources Development Program. Sep 1992. 22p. Sponsored by Tennessee Valley Authority, Knoxville, TN (United States). Order Number DE95008552. Source: OSTI; NTIS; GPO Dep.

Reference books are the primary source of wood property data for use in research, school, or business. it has been our experience that obtaining the needed data from several references can be a cumbersome and time-consuming ordeal. These spreadsheets are a compilation of data from several well-known references. Version 1.1 includes the most recent update of commercial woods of the United States and the world. It is intended that they be used for quick summaries, comparisons, and calculations to increase the efficiency of the professional user in report preparation.

The Project Description lists and describes six tasks, three of which are virtually complete, with three others underway. A summary of progress on each task follows. Task 1: Development of a Detailed Test Plan. This task is complete. Task 2: Preparation of Test Equipment. This task is complete. Two test units (a six-inch internal diameter and a fifteen-inch internal diameter unit) were prepared and used as described under Task 4. Task 3: Obtain test materials. The required amounts of oil shale and pelletized municipal solid waste have been obtained, tested, and found to be suitable. We have obtained an adequate quantity of a pelletized "standard" MSW from BEPR/BFI, Eden Prairie, MN. For test purposes, we synthesized the desired "worst probable case" of MSW by the addition of sulfur and chlorine to reach the sulfur and chlorine levels characteristic of such waste. Task 4: Execute Feasibility Demonstration Program. The fluidized bed tests associated with the program have been completed. Analysis of the results is continuing. Testing of the waste stream material generated from these runs will begin about 6 April to evaluate its possible use as cement for specific applications. Information on the technical feasibility of the invention as indicated by the fluid bed test program is included as Attachment A. The results demonstrate that the process is technically feasible. Task 5: Data Analysis. This task is beginning. Task 6: Project Management, Reporting, and Necessary Liaison Activities. Those portions of this task associated with work done on Tasks 1 through 4 have been completed. This task will continue throughout the period of the study. In summary, work is proceeding within budget. No serious problems in the next scheduled tasks are foreseen.

15251 (DOE/CE/40735–2) **Development of a gravel bed combustor for a solid fueled gas turbine for the period February 1, 1989 to June 30, 1991.** Ragland, K.W.; Aerts, D.J.; Palmer, C.A. Wisconsin Univ., Madison, WI (United States). Dept. of Mechanical Engineering. Jun 1992. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85CE40735. Order Number DE95009677. Source: OSTI; NTIS; GPO Dep.

Further work on a novel pressurized, downdraft combustor using aspen woodchips is reported for the period 2/89 to 6/91. The 42 cm i.d combustor was connected to a modified Allison 250-C20B gas turbine engine and operated for 250 hours. The performance of the combustor-turbine system is discussed. Deposits of ash on the turbine nozzles and rotors are identified and discussed. A dynamic simulation model for the combustor-turbine system is presented and used to investigate the control of the system. The highest net power output was 61 kW or 20% of full power; the highest turbine speed was 75% of the maximum speed; the highest mass flow was 50% of the full power flow. The stability of the combustor must be improved before higher output and longer runs can be achieved.

15252 (DOE/CE/40735–3) **100 Hour test of the pressurized woodchip-fired gravel bed combustor.** Ragland, K.W.; Aerts, D.J. Wisconsin Univ., Madison, WI (United States). Dept. of Mechanical Engineering. Aug 1992. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-85CE40735. Order Number DE95009678. Source: OSTI; NTIS; GPO Dep.

In this project a downdraft, packed bed combustor for a gas turbine cogeneration system using woodchips is being developed. The combustor is designed to promote intense combustion in a thin reaction zone and to control particulate growth by using high excess air. The combustor contains a magnesia and alumina gravel bed on top of which woodchips are fed. The following test objectives were established for the 100 hr test: (a) demonstrate preliminary durability of the combustor; (b) demonstrate steady operation of the system; (c) investigate combustor pressure drop; (d) investigate bed ash cake buildup; (e) expose metal alloy coupons for corrosion examination; (f) obtain closure within 10% on mass and energy balances; and (g) obtain emissions data. The plan for the 100 hr test was to operate the combustor at the following conditions: day 1, 4 atm (absolute) pressure and 700–800 C outlet temperature; day 2, 4 atm pressure and 800–900 C outlet temperature; day 3, 5 atm pressure and 800–900 C outlet temperature; days 4 and 5, repeat day 3. The inlet air was not preheated. The paper gives test results and discusses fuel characterization, combustor performance, mass and energy balance, emissions, composition of ash and deposits, and metal coupons representing turbine blade material.

15253 (NEI-DK–1948) **Optimization of straw-fuelled district heating plants.** Energiministeriets Forskningsudvalg for produktion og fordeling af el og varme. Braendsler og forbraendingsteknik. Dahlin, J.; Ravn-Jensen, L.; Nielsen, C. Dk-TEKNIK, Soeborg (Denmark). Energi og Miljoe. Dec 1994. 69p. (In Danish). Contract ENS-1323/91-0023. Order Number DE95772349. Source: OSTI; NTIS.

EFP-91.

A description of the background, methods and results of 3 subprojects dealing with the optimization of straw-fuelled district heating plants in Denmark. These are an experiment at Loejt Kirkeby on air distribution and several fuelling techniques related to 'cigar' fuelling, and on manures and the reduction of nitrogen oxides, an experiment at Roedby harbour district heating plant where improvements were made at the batch-fired whole-bale system and an experiment at Mariager district heating plant where measurements were taken at a straw-fuelling system where straw is fuelled in small pieces. At Loejt Kirkeby carbon monoxide and nitrogen oxides in the flue gas were reduced, the former significantly, and in relation to the injection of liquid manures NO_x emission was decreased. The water content of the manure resulted in energy loss. At Roedby harbour where batch fuelling was changed to continual fuelling and where spaces in the walling of the combustion chamber were filled in with masonry and combustion air was lead through jet nozzles for counter-current combustion, these changes resulted in a rise of temperature from 500 to 1000 degrees centigrade in the boiler, satisfactory burnup and amount of combustion air, a significant reduction of CO emission, less odour, improved combustion quality and improved efficiency. At Mariager where a straw divider system is used the combustion air distribution was improved, leading to a reduction of CO emission from 2000 ppm to 700 ppm. Earlier fluctuations in CO concentration were lessened. (AB)

15254 (NEI-DK–1949) **Fuelling with wet wood-fuel chips. Fuelling experiment at district heating plants with wood-fuel chips consisting of fresh, mechanically de-needled whole trees.** Energiministeriets Forskningsudvalg for produktion og fordeling af el og varme. Braendsler og forbraendingsteknik. Houmann Jakobsen, H. Dk-Teknik, Soeborg (Denmark). Jan 1995. 106p. (In Danish). Contract ENS-1323/90-0012. Order Number DE95772348. Source: OSTI; NTIS.

EFP-90.

The consequences of using wood fuel chips produced from recently felled, mechanically de-needled whole trees were investigated through fuelling experiments at two Danish heating plants at Hovedgaard and Kibaek. Each plant had condensing flue gas cooling facilities. When the needles are removed mechanically in the forest the parts of the whole tree which are not to be used can be removed immediately so that there is a minimum need to use heavy vehicles which churn up the forest floor. Wood chip moisture content is dependent on the length of time they are left in the forest before delivery at the plants. The effect on combustion of burning fresh wood chips with a high moisture content are described in addition to any technological adjustments that were be needed in this situation. Wood from three types of trees and varied moisture content was used. It was found that it was the ability of the combustion system to maintain a high quality of combustion which set the limits of moisture content of this fuel, allowing for satisfactory combustion. Low emission was also of importance. It was shown that it could be economically advantageous to use wood chips with a moisture content of over 50%, which means that wood from Norwegian spruces are not suitable. The Firbaek plant has tried sandwich fuelling - laying wood pills over the wet wood chips and this has made it possible to combust wood chips with a moisture content of 58% satisfactorily. (AB)

15255 (NEI-DK–1953) **Development of woodchip-fired gasification system for cogeneration plant.** Houmann Jakobsen, H.; Stenholm, M.; Christiansen, K. Dk-TEKNIK, Soeborg (Denmark). Energi og Miljoe. Nov 1994. 193p. (In Danish). Contract ENS-51161-91.0038. Order Number DE95772376. Source: OSTI; NTIS.

A new type of system was developed for the gasification of wood chips at cogeneration plants, and the market for such a system was investigated. Demands on a lower moisture content and a larger size of wood chip would mean that production methods would have to change and this would increase costs. A moisture content of lower than 25% could not be achieved. A change in the size of the chips would also involve expensive changes in production methods and forestry and drying equipment. It is pointed out that within a free market the development of wood gasification systems is wholly dependent on the economical situation of the consumers. A wood gasification system (capacity: 50 kW_e) with a new Open Core gas generator, was designed for use at a center for further education. This is described in detail. Total costs were estimated at ca. 1,995,000 Danish kroner. The Danish market for gasification systems for cogeneration plants will consist of existing biomass-fuelled plants that find it necessary to change out equipment and smaller towns with no established district heating system that have the necessary economical means. The Eastern European countries should also provide a market for wood gasification systems. Taking a profit into consideration with regard to optimizing a 500 kW_e gasification system within a cogeneration plant, it was reckoned that the total investment (for the whole plant) would be ca. 9.5 million Danish kroner, about 19,000 kroner per kW_e. It is concluded that the development of such a wood gasification system could contribute significantly to a market based on the use of biomass to produce energy. (AB)

15256 (NEI-DK–1976) **Electricity and heating based on wood chips for Mosbjerg and Tolne. A pilot project.** Soerensen, P.A. (PlanEnergi, Skoerping (Denmark)); Muenster, E.; Houmann Jakobsen, H.; Christensen, O.; Falk, J. Planenergi S/I, Nordjylland (Denmark). [1995]. 110p. (In Danish). Contract ENS-51161-94.0048. Order Number DE95772378. Source: OSTI; NTIS.

The project has shown that there are sufficient resources of wood chips in the locality to enable the operation of a cogeneration plant and that the amount of wood chips can be increased significantly if short rotation forest cultivation is utilized. The capacity of the plant would be 1.5 MW and ca. 0.4 MW. 4 types of gasification systems are described, two of which, in addition to Stirling and steam motor techniques, are applicable. Gas from concurrent gasifiers can be burnt in the Jenbacher gas motor and gas from counter current gasifiers will be burnt if tar condensation can be avoided before combustion. Calculations were made of consumer prices in the case of individual oil burners, cogeneration plants fired with natural gas and fired with wood chips. The size of the percentage of subsidization of the plant which would bring down the price of heating to the same level as for individual heating by oil burners was also calculated. Results are presented. Calculations were also carried out with regard to the use of a small Stirling motor. Cost calculations are tentative. The use of a Stirling motor would result in a reduction by 63.3 tons sulphur dioxide, 33.5 tons

of nitrogen oxides and 69.500 tons of carbon dioxide, which is significant. If the project is to be realized it is recommended that two companies are established so that eventual extra costs do not have to be met by the consumers. (AB)

15257 (NYSERDA–95-5) **Combustion testing and heat recovery study: Frank E. Van Lare Wastewater Treatment Plant, Monroe County. Final report.** New York State Energy Research and Development Authority, New York, NY (United States); Monroe County Dept. of Engineering, Rochester, NY (United States); Malcolm Pirnie, Inc., Rochester, NY (United States). Jan 1995. 146p. Sponsored by New York State Energy Research and Development Authority, Albany, NY (United States). Source: OSTI; New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223 (United States).

The objectives of the study were to record and analyze sludge management operations data and sludge incinerator combustion data; ascertain instrumentation and control needs; calculate heat balances for the incineration system; and determine the feasibility of different waste-heat recovery technologies for the Frank E. Van Lare (FEV) Wastewater Treatment Plant. As an integral part of this study, current and pending federal and state regulations were evaluated to establish their impact on furnace operation and subsequent heat recovery. Of significance is the effect of the recently promulgated Federal 40 CFR Part 503 regulations on the FEV facility. Part 503 regulations were signed into law in November 1992, and, with some exceptions, affected facilities must be in compliance by February 19, 1994. Those facilities requiring modifications or upgrades to their incineration or air pollution control equipment to meet Part 503 regulations must be in compliance by February 19, 1995.

0930 Economic, Industrial, and Business Aspects

15258 (INIS-mf–14507) **Biomass energy in Jordan, and its potential contribution towards the total energy mix of the Kingdom.** Al-Dabbas, Moh'd A. F. (ed.). Ministry of Energy and Mineral Resources, Amman (Jordan). Apr 1994. 20p. (In Arabic). Order Number DE95628116. Source: OSTI; NTIS (US Sales Only); INIS.

Report reviewed by Mr. Ziad Jibril from the Ministry of Energy and Mineral Resources, Amman (Jordan).

An evaluation of Jordan's bio-energy status was carried out. Available sources and the viability of exploitation were studied in order to identify the size of contribution that bio-energy could provide to the total energy mix of the Kingdom. The advantages of biogas technology were discussed, and a general description of Jordan's experience in this field was presented. Data on Jordan' animal, municipal, and agricultural wastes that are available as a potential source of bio-energy was tabulated. The report ascertained the economic feasibility of biogas utilization in Jordan, and concluded that the annual energy production potential from biogas, with only animal wastes being utilized, would amount to 80,000 ton oil equivalent. This amount of energy is equivalent to 2% of Jordan's total energy consumption in 1992. The utilization of biogas from municipal wastes would produce an additional 2.5% of the total energy consumption of Jordan. The annual value of utilizing animal and municipal wastes would reach 23 million Jordanian Dinars (JD). This value would increase to 61.5 million JD with the utilization of human wastes. The investment required for the utilization of bio-energy sources in Amman and its suburbs on the scale of family unit fermenters was estimated to be in the order of a million JD. The size of investment for industrial scale utilization for power generation with an electricity feed to the national grid, would range from 3 to 4 million JD. (A.M.H.). 8 refs., 4 tabs.

15259 (NEI-DK–1942) **Wood fuel resources from the Danish forests bigger than 0.5 ha. Status and forecast.** Skovbrugsserien, 10-1994. Hougs Lind, C. Forskningscentret for Skov og Landskab, Lyngby (Denmark). 1994. 210p. (In Danish). Contract ENS-51161-93.0032. Order Number DE95772356. Source: OSTI; NTIS; INIS.

In this report fuel wood resources available for large scale energy production in the period 1990-2019 are estimated. Estimates are based on the comprehensive Danish 1990 National forest Inventory covering forests above 0.5 ha. The inventory comprises data on e.g. tree species, age class, and yield class. All resource estimates are made countywise and as averages in 10 year periods, that is the periods 1990-1999, 2000-2009 and 2010-2019. Future annual felling is calculated from yield tables for the tree species most common and area extrapolation models including afforestation. The forest products most commonly produced are commercial wood in the form of timber and logs for sawmills and other wood industries and industrial wood for chip board, packing, and paper production, etc. as well as fuel wood including chips for energy purposes. In general, only the small-dimensioned parts of the trees are used for fuel wood. The present annual production/consumption of fuel wood is 553.000 cbm(s) (263.000 tdm). Certain industrial wood assortments including pulpwood could be produced from volume 0-10 cm. However, fuel wood, mainly chips, could be produced from volume 10-15 cm. The price relations between industrial wood and chips will determine the felling practice, as the wood has competitive uses: If the prices of industrial wood are low and the marketing conditions difficult, chipping is encouraged at the expense of industrial wood. If the prices of industrial wood are high and marketing conditions good, the industrial wood production is encouraged at the expense of chips. The marginal return at mechanical felling operations varies with the felling practice and with the diameter of the thinning. Below a certain thinning diameter, the trees and the felling volume are too small to make production of industrial wood profitable. In this case it will be most profitable to produce chips from the total felling volume. (Eg) (37 refs.)

0940 Transport, Handling, and Storage

15260 (NEI-DK–1906) **Collection of gas from a storage tank with a concrete lid, at Skovsgaard.** Johansen, K. Jysk Biogas, Farsoe (Denmark). [1995]. 16p. (In Danish). Contract ENS-51161-92.0017. Order Number DE95766486. Source: OSTI; NTIS.

It was investigated whether it was possible to establish the collection of methane from an 18 meter/diameter storage tank with a layered concrete lid at a biomass conversion plant on a Danish farm. The tank was not effectively sealed and also it could not withstand too much pressure. The use of suction when the lid was fixed could result in too little pressure, or too much, within the storage tank. A satisfactory collection of methane form the tank would result in a reduction of odor. A 100 mm tube was connected to the tank, it sloped so that any water could flow back. A blower was fitted to extract the methane, the pressure was regulated via a pressure transmitter and a frequency transformer. A safety system ensured that pressure was neither too high nor too low for the storage tank. The system worked satisfactorily with the exception of the fact that the pressure rose when the methane was pumped out, but this could be regulated. The storage tank was properly sealed and covered with a rubber material and the methane collection system has now been in use for two years. The safety system has also proved satisfactory. (AB)

Recent measurements of air emissions from small-scale wood firing have shown high concentrations of VOC, which have not earlier been analyzed. Possible health risks from these emissions are discussed in this report. It is noted that the lack of data for certain compounds, and of epidemiological surveys of exposed populations makes it impossible to give estimates e.g. of cancers caused by these emissions. 31 refs. 2 tabs

Cancer risks due to emission from wood-fired boilers were estimated on the basis of analytical studies of emission carried out by the Swedish National Testing and Research Laboratory. The annual doses of measured potentially genotoxic components (PAH, formaldehyde, benzene, ethylene, propylene, butadiene) in different residential areas were estimated by means of a dispersion model. The total cancer morbidity risks in areas with free standing homes is estimated to amount to 30 and 100 cases per million and year in South and North Sweden resp. with 'direct firing' of the boilers. The emissions are reduced by a factor of about 10 by firing at maximum heat load ('accumulator firing'), particularly with new boiler constructions operated to give low tar emissions. The risk estimates, based on available epidemiological and dosimetric data, are judged to be uncertain by a factor of about 8. They indicate, however, that pollution from wood combustion cannot be ignored as a risk factor. Particularly, this concerns butadiene which is emitted in relatively large amounts and causes some 50% of the summed-up risks. Among other things this shows the importance of obtaining a more reliable risk estimation of butadiene. 32 refs, 7 tabs

We proposed to demonstrate the effectiveness of a catalytic membrane reactor (a ceramic membrane combined with a catalyst) to selectively produce methanol by partial oxidation of methane. Methanol is used as a chemical feedstock, gasoline additive, and turbine fuel. Methane partial oxidation using a catalytic membrane reactor has been determined as one of the promising approaches for methanol synthesis from methane. In the original proposal, the membrane was used to selectively remove methanol from the reaction zone before carbon oxides form, thus increasing the methanol yield. Methanol synthesis and separation in one step would also make methane more valuable for producing chemicals and fuels. However, all the membranes tested in this laboratory lost their selectivity under the reaction conditions. A modified non-isothermal, non-permselective membrane reactor then was built and satisfactory results were obtained. The conversion and selectivity data obtained in this laboratory were better than that of the most published studies.

15265 (DOE/PC/90018–T8) **Development of alternative fuels from coal-derived syngas. Quarterly status report No. 9, October 1, 1992–December 31, 1992.** Air Products and Chemicals, Inc., Allentown, PA (United States). [1995]. 53p. Sponsored by USDOE, Washington, DC (United States). 15268 (DOE/PC/90042–T11) **Development of a catalyst for conversion of syngas-derived materials to isobutylene. Quarterly technical report No. 12, January 1, 1994–March 31, 1994.** Barger, P.T. UOP, Inc., Des Plaines, IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90042. Order Number DE95009358. Source: OSTI; NTIS; GPO Dep.

The goals of this project are to develop a catalyst and process for the conversion of syngas to isobutanol. The research will identify and optimize key catalyst and process characteristics. In addition, the commercial potential of the new process will be evaluated by an economic analysis. This report describes pilot plant testing using a 10/1 methanol/ethanol feed blend to identify potential catalysts for the conversion of lower alcohols derived from synthesis gas to isobutanol and other C_{4+} oxygenates. The previous work in this project found that a typical Cu/Zn/Al oxide methanol synthesis catalyst is capable of producing isobutanol and isobutryaldehyde from a feed consisting of a blend of methanol and ethanol. Best performance was obtained at moderate temperature (300 °C) and low pressure (30 psig). This report describes the results of space velocity testing with this catalyst to elucidate the reaction pathway. It has been found that at high ethanol conversion levels (low space velocities), yields of isobutanol and other C_{4+} oxygenates do not increase with increasing methanol conversion. This suggests that Cu/Zn/Al oxide is not active for the condensation of methanol alone to higher alcohols. Therefore, new catalyst formulations are being evaluated for this reaction using the Cu/Zn/Al oxide performance as a baseline. Promising materials will also be examined at high ethanol conversion levels and with a methanol only feed to determine their capability to condense methanol.

15269 (DOE/PC/90042–T12) **Development of a catalyst for conversion of syngas-derived materials to isobutylene. Quarterly technical report No. 13, April 1, 1994–June 30, 1994.**

Barger, P.T. UOP, Inc., Des Plaines, IL (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90042. Order Number DE95009359. Source: OSTI; NTIS; GPO Dep.

The goals of this project are to develop a catalyst and process for the conversion of syngas to isobutanol. The research will identify and optimize key catalyst and process characteristics. In addition, the commercial potential of the new process will be evaluated by an economic analysis. This report describes the preparation and testing of a variety of potential higher alcohols synthesis catalysts based on a bifunctional formulation consisting of a noble metal dehydrogenation function on a basic mixed metal oxide support. A pilot plant catalyst screening test using a 10/1 methanol/ethanol feed blend has been used to identify a new class of catalysts that afford higher selectivities and productivities. of the desired isobutanol and other C_{4+}, products than the Cu/Zn/Al oxide methanol synthesis catalyst that is being used as a baseline for this work. 2% Pd or Pt on a Zn/Mn/Zr oxide support and 2% Pd on a Zn/Mn/Cr support have given the best performances to date. In addition to isobutanol, these catalysts afford significant quantities of isobutyraldehyde and methyl isobutyrate. In order to elucidate the reaction pathway occurring with this class of catalyst, the 2%Pd on Zn/Mn/Zr oxide catalyst has been evaluated over a range of space velocities. It has been found that isobutanol and higher oxygenates yields increase with decreasing space velocity at ethanol conversions greater than 90%. This suggests that this catalyst is capable of converting methanol alone to higher alcohols. This is different from the result obtained with the Cu/Zn/Al oxide baseline catalyst, which showed no change in product yields at high ethanol conversions. Therefore, further effort will be focussed on the development of these noble metal/basic metal oxide catalysts for this application.

15270 (DOE/PC/90042–T13) **Development of a catalyst for conversion of syngas-derived materials to isobutylene. Quarterly report No. 14, July 1, 1994–September 30, 1994.** Barger, P.T.; Kurek, P.R. UOP, Inc., Des Plaines, IL (United States). [1994]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC90042. Order Number DE95009360. Source: OSTI; NTIS; GPO Dep.

The goals of this project are to develop a catalyst and process for the conversion of syngas to isobutanol. The research will identify and optimize key catalyst and process characteristics. In addition, the commercial potential of the new process will be evaluated by an economic analysis. Previous work had identified Pt and Pd on Zn/Mn/Zr oxide and Pd on Zn/Mn/Cr oxide as promising catalysts for the conversion of a 10/1 methanol/ethanol blend to higher oxygenates. The reproducibility of these catalyst preparations has been found to be generally good, although some variations in performance have been observed between the Pd containing samples. Further characterization of the catalysts showing performance differences is in progress to determine whether compositional variations can account for the discrepancies. Several new 2% Pt on metal oxide catalysts have been prepared and tested. None of these materials performed better than the original 2% Pt on Zn/Mn/Zr (34/34/32 molar) oxide catalyst. However, a lower Zr content support (45/45/10 Zn/Mn/Zr oxide) gave similar results. Evaluation of the 2% Pd on Zn/Mn/Cr oxide at high space velocities has indicated that this material may be substantially less active for the $C_1 - C_1$, condensation step necessary for methanol only conversion to higher alcohols. In view of this finding, subsequent research will focus on the development of the Zn/Mn/Zr oxide support. A variety of alternative catalyst formulations have also been prepared and tested, but have failed to match the performance of noble metal on mixed metal oxide catalysts. These materials have include Cu and Mo on TiO_2, Mg/Al MOSS and polyvinylpyridine and commercial and laboratory prepared Mn oxide samples.

15271 (DOE/PC/91034–T10) **The economical production of alcohol fuels from coal-derived synthesis gas. Quarterly technical progress report number 12, July 1–September 30, 1994.** West Virginia Univ. Research Corp., Morgantown, WV (United States). Oct 1994. 29p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91034. Order Number DE95009363. Source: OSTI; NTIS; GPO Dep.

Both plug-flow microreactor systems at WVU are now functioning. Screening runs on these systems were started using carbide and nitride catalysts first, to avoid any question of contamination of the system with sulfur. The carbide and nitride catalysts are characterized by high activity but low selectivity towards alcohols. The Chevrel-phase catalysts tested have much lower activities but may be more selective to alcohols. Catalyst synthesis procedures are attempting to offset this tendency, and also to characterize and prepare sulfide catalyst by other approaches. At UCC and P, test runs on the reactor system have commenced. Higher alcohols up to butanol were observed and identified at high temperatures. Modeling studies have concentrated on the catalytic membrane reactor. The topical report, originally submitted last quarter, was revised after some errors were found. This report includes the design and economics for the seven cases discussed in previous quarterly reports. In the topical report, it is shown that a judicious choice of coal:natural gas feed ratio to the alcohol synthesis process allows the Shell Gasifier to be nearly competitive with natural gas priced at of $3.00/MMBtu. The advantage of the Shell Gasifier over the Texaco Gasifier is that the former produces a syngas with a lower H_2:CO ratio. When the feed to the process is coal only, there is no difference in the projected economics that would favor one gasifier over the other. The potential of co-generation of electric power with high alcohol fuel additives has been investigated. Preliminary results have revealed that a once-through alcohol synthesis process with minimal gas clean-up may provide an attractive alternative to current designs given the prevailing economic status of IGCC units.

15272 (DOE/PC/91034–T11) **The economical production of alcohol fuels from coal-derived synthesis gas. Quarterly technical progress report number 13, October 1–December 31, 1994.** West Virginia Univ. Research Corp., Morgantown, WV (United States). Jan 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91034. Order Number DE95009365. Source: OSTI; NTIS; GPO Dep.

At WVU, Mo_2S_3 was produced from gas-phase reactions at 1,100 C. The gas-phase reactor was modified to increase product yields and to decrease particle size. Four Chevrel phases were synthesized for catalytic evaluation. In addition, four supported alkali-modified MoS_2 materials were prepared from a single-source precursor, $K_2Mo_3S_{13}$. Screening runs have been carried out on some of these materials and others prepared earlier. At UCC and P, test runs on the reactor system have commenced. Higher alcohols up to butanol were observed and identified at high temperatures. Significant progress has been made on the Monte Carlo uncertainty analysis. Frequency distributions have been determined for all of the equipment blocks for the Texaco gasifier cases. For these cases, there is a 10% chance that the actual installed capital cost could exceed the estimated installed capital cost by $40 million dollars. This work will continue with inclusion of variable costs and prediction of the uncertainties in the return on investment. Modifications to the simulated annealing optimization program have been underway in order to increase the level of certainty that the final result is near the global optimum. Alternative design cases have been examined in efforts to enhance the economics of the production of high alcohols. One such process may be the generation of electric power using combustion turbines fueled by synthesis gas.

15273 (DOE/PC/92110–T7) **Development of vanadium-phosphate catalysts for methanol production by selective oxidation of methane. Quarterly technical progress report No. 6, July–Septembedr 1994.** McCormick, R.L. Colorado School of Mines, Golden, CO (United States). 10 Jan 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92110. Order Number DE95009645. Source: OSTI; NTIS; GPO Dep.

This is the eighth quarterly technical progress report. During this quarter the project was initiated, after transfer via a novation agreement, at the Colorado School of Mines. Project initiation activities have included: set up of catalyst synthesis apparatus; training on x-ray diffraction and FTIR apparatus; set up of catalyst testing reactor; set up of reactor product analytical systems; and Sst up and method development for measuring catalyst acidity via FTIR. At the end of this quarter significant progress had been made towards completion of these initiation activities. Several

catalyst syntheses have been performed and the catalysts characterized by x-ray diffraction and FTIR. The catalyst testing reactor system is operational. Reactor product analysis system is nearing completion. Initiation of this system was delayed by the unavailability of a Valco valve which has just recently arrived. Set up of the in-situ FTIR cell for catalyst acidity studies has begun. In this report the results of several catalyst syntheses are reported along with characterization results. In particular, impregnation of vanadyl pyrophosphate with potassim nitrate dramatically reduced the number of surface hydroxyl groups. Such groups may be important in the non-selective, total oxidation of hydrocarbons. Also, preliminary experimental results on FTIR spectra of adsorbed pyridine are presented. It is shown that pyridine adsorbed on the catalyst surface can be easily observed by the diffuse reflectance IR technique. We plan to apply this technique to measurement of the acid site strength of surfaces modified with promoters.

15274 (DOE/PC/92111–T8) **Conversion of light hydrocarbon gases to metal carbides for production of liquid fuels and chemicals. Quarterly technical status report, October 1, 1994–December 31, 1994.** Diaz, A.F.; Modestino, A.J.; Pride, J.D.; Howard, J.B.; Tester, J.W.; Peters, W.A. Massachusetts Inst. of Tech., Cambridge, MA (United States). Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92111. (FE-MIT–92111-9). Order Number DE95009366. Source: OSTI; NTIS; GPO Dep.

Scoping runs with up to 0.125 cfm methane in 1 cfm (ambient temperature) of argon and 12g/min of MgO were performed in October using a graphite anode and tungsten cathode in the new plasma reactor. A GC analysis of the gas sample from the cooling chamber and of the head space gas above the hydrolyzed solid sample revealed the presence of C_3H_4 and C_2H_2, which suggests the formation of magnesium carbide. However, a similar run performed with MgO feeding into a pure argon plasma gave similar results, indicating possible reaction of the graphite electrode with the MgO to form carbides and/or direct formation of C_3H_4 and C_2H_2 in the arc. A GC analysis of the gas sample taken from the cooling chamber from a run in an argon plasma without MgO feeding did no yield any C_3H_4 and C_2H_2, suggesting that the MgO powder is hydrated and is a probable hydrogen source. Thus far, the main obstacle to performing a 100% methane/MgO scoping run is the instability of the methane plasma. Two approaches are being taken to address this issue: increasing the open circuit voltage of the power supply to permit operation of an arc at higher voltage levels and magnetically rotating the arc with a solenoid around the plasma reactor. The latter approach is currently being pursued.

15275 (DOE/PC/92113–T6) **Methane coupling by membrane reactor. Quarterly technical progress report, June 25, 1994–September 24, 1994.** Ma, Yi Hua. Worcester Polytechnic Inst., MA (United States). 4 Jan 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-92PC92113. Order Number DE95009642. Source: OSTI; NTIS; GPO Dep.

This quarterly report describes results from the experimental studies on oxidative coupling of methane, oxygen conducting perovskite dense membrane synthesis and modeling studies of the methane coupling reaction. The focus of the experimental study is to explore the effects of varying catalyst loading, varying methane to oxygen ratios and feed conditions when the oxygen conversion is much less than 100%. Results from these studies help in understanding the effects of various parameters controlling methane coupling. Dense membrane synthesis and characterization results are presented which describe new approaches to the synthesis and characterization of these membranes. The modeling results described in this report present a theoretical fit to the experimental data on oxidative coupling of methane in fixed bed reactors. The parameters from the fit are used to predict the trends in experimental data obtained from VYCOR membrane reactors. The predicted trends are based on a theoretical model employing simplified methane coupling kinetics.

15276 (DOE/PC/94066–T1) **Isobutanol-methanol mixtures from synthesis gas. Quarterly technical progress report, 1 October–31 December 1994.** Iglesia, E. California Univ., Berkeley, CA (United States). [1994]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-94PC94066. Order Number DE95010620. Source: OSTI; NTIS; GPO Dep.

Objective was to design a catalyst for synthesizing isobutanol with a productivity of 200 g isoalcohols/g-cat-h and a molar isobutanol/methanol ratio near unity, and to develop structure-function rules for designing catalyst for selective conversion of synthesis gas to isoalcohols. Activities during this period are reported; equipment reported include controlled pH precipitation unit, catalytic microreactor, and temperature programmed surface reaction/infrared unit.

13 HYDRO ENERGY

1301 Resources and Availability

15277 (DOE/BP–95009167) **Annual report of the Columbia River Treaty, Canada and United States Entities, 1 October 1993–30 September 1994.** USDOE Bonneville Power Administration, Portland, OR (United States). Nov 1994. 58p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009167. Source: OSTI; NTIS; GPO Dep.

The report describes the operation of Mica, Arrow, Duncan, and Libby reservoirs for the 1994 Water Year, 1 Oct 1993 through 30 Sept 1994, with additional information covering the reservoir system operating year, 1 August 1993 through 31 July 1994. The report is divided into: introduction, treaty organization, operating arrangements, weather and streamflow, reservoir operation, and power and flood control accomplishments.

15278 (NYSERDA–95-6) **Niagara Falls Wastewater Treatment Plant outfall hydropower feasibility study. Final report.** New York State Energy Research and Development Authority, New York, NY (United States); Niagara Falls Waste Water Treatment Plant, NY (United States). Jan 1995. 199p. Sponsored by New York State Energy Research and Development Authority, Albany, NY (United States). Source: OSTI; New York State Energy Research and Development Authority, Two Rockefeller Plaza, Albany, NY 12223 (United States).

A feasibility study was conducted to examine the technical and economic merit of constructing what could be the largest hydropower generation facility using treated wastewater effluent in New York State. The impetus of the study was to take advantage of the nearly 200-foot elevation change from the Niagara Falls wastewater treatment plant site to the discharge at the Lower Niagara River. The proposed project would utilize the existing Adams Tailrace Tunnel, which carries the treated effluent beneath the City of Niagara Falls, New York, 150 to 200 feet below ground level. Potential access to the tunnel is through a series of shafts and abandoned, turn-of-the-century hydropower generation facilities. The study included determining the quantity and quality of flow available for hydropower generation from the wastewater treatment plant and the industrial non-contact cooling water that discharges into the same shaft; determining current electric power consumption and billing rates of potential power usage locations; developing and prescreening various hydropower locations and turbine alternatives; evaluating generated power usage options; performing a technical and economic evaluation of the most feasible alternatives; and developing a preliminary design and estimating project costs of the recommended alternative. The study concluded that a 1,025 KW turbine/generator located at the treatment plant site was the most economically feasible alternative. The proposed facility has an estimated project cost of $4,100,000 and will annually generate an equivalent of approximately $388,000 of hydroelectric power based on current electric rates and 1994 dollars. Over the 40-year expected life of the project, the net present worth of savings was estimated at $9,900,000.

1305 Economic, Industrial and Business Aspects

15279 (INIS-mf–14496) **Hydro energy - a chance for ecology.** Novakova, R. Energoproekt, Sofia (Bulgaria). 1994. 5p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy

problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627079. Source: OSTI; NTIS (US Sales Only); INIS.

A review of the present status and perspectives of hydroelectric power plants (HPP) in Bulgaria is presented. The importance of hydro energy for Bulgarian energetics is stressed. The total installed hydro energetic capacity is 1940 MW. The possibility for construction of new large-scale conventional capacities of 2600 MW and some micro HPP of 215 MW is discussed. Some negative impacts of HPP on drying the forests resulting in lowering the water levels are pointed out as well as some financial aspects of the issue. (orig.).

15280 (DOE/BP–17758-2) **Investigations of bull trout (Salvelinus confluentus), steelhead trout (Oncorhynchus mykiss), and spring chinook salmon (O. tshawytscha) interactions in Southeast Washington streams. Final report 1992.** Underwood, K.D.; Martin, S.W.; Schuck, M.L.; Scholz, A.T. Washington State Dept. of Wildlife, Olympia, WA (United States). Jan 1995. 172p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-91BP17758. Order Number DE95009164. Source: OSTI; NTIS; INIS; GPO Dep.

The goal of this two year study was to determine if supplementation with hatchery reared steelhead trout (Oncorhynchus mykiss) and spring chinook salmon (O. tshawytscha) negatively impacted wild native bull trout (Salvelinus confluentus) through competitive interactions. Four streams with varying levels of fish supplementation activity were sampled in Southeast Washington. Tasks performed during this study were population density, relative abundance, microhabitat utilization, habitat availability, diet analysis, bull trout spawning ground surveys, radio telemetry of adult bull trout, and growth analysis. Results indicate that bull trout overlapped geographically with the supplemented species in each of the study streams suggesting competition among species was possible. Within a stream, bull trout and the supplemented species utilized dissimilar microhabitats and microhabitat utilization by each species was the same among streams suggesting that there was no shifts in microhabitat utilization among streams. The diet of bull trout and O. mykiss significantly overlapped in each of the study streams. The stream most intensely supplemented contained bull trout with the slowest growth and the non-supplemented stream contained bull trout with the fastest growth. Conversely, the stream most intensely supplemented contain steelhead with the fastest growth and the non-supplemented stream contained steelhead with the slowest growth. Growth indicated that bull trout may have been negatively impacted from supplementation, although other factors may have contributed. At current population levels, and current habitat quantity and quality, no impacts to bull trout as a result of supplementation with hatchery reared steelhead trout and spring chinook salmon were detected. Project limitations and future research recommendations are discussed.

(Biotech Research and Consulting, Inc., Corvallis, OR (United States)); Ewing, S.K.; Sheahan, J.E. Oregon Dept. of Fish and Wildlife, Portland, OR (United States). Sep 1994. 167p. Sponsored by USDOE, Washington, DC (United States). DOE Contract BI79-88BP92818. Order Number DE95009166. Source: OSTI; NTIS; INIS; GPO Dep.

Hydropower development and operations in the Columbia River basin have caused the loss of 5 million to 11 million salmonids. An interim goal of the Northwest Power Planning Council is to reestablish these historical numbers by doubling the present runs from 2.5 million adult fish to 5.0 million adult fish. This increase in production will be accomplished through comprehensive management of both wild and hatchery fish, but artificial propagation will play a major role in the augmentation process. The current husbandry techniques in existing hatcheries require improvements that may include changes in rearing densities, addition of oxygen, removal of excess nitrogen, and improvement in raceway design. Emphasis will be placed on the ability to increase the number of fish released from hatcheries that survive to return as adults. Rearing density is one of the most important elements in fish culture. Fish culturists have attempted to rear fish in hatchery ponds at densities that most efficiently use the rearing space available. Such efficiency studies require a knowledge of cost of rearing and the return of adults to the fisheries and to the hatchery.

15282 (DOE/EA–0940/1/95) **Hellsgate Winter Range: Wildlife Mitigation Project. Preliminary environmental assessment.** USDOE Bonneville Power Administration, Portland, OR (United States). Jan 1995. 79p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009170. Source: OSTI; NTIS; GPO Dep.

The Bonneville Power Administration proposes funding the Hellsgate Winter Range Wildlife Mitigation Project in cooperation with the Colville Convederated Tribes and Bureau of Indian Affairs. This Preliminary Environmental Assessment examines the potential environmental effects of acquiring and managing property for wildlife and wildlife habitat within a large project area. The Propose action is intended to meet the need for mitigation of wildlife and wild life habitat that was adversely affected by the construction of Grand Coulee and Chief Joseph Dams and their reservoirs.

15283 (DOE/EA–0940/3/95) **Hellsgate Winter Range: Wildlife mitigation project. Final environmental assessment.** USDOE Bonneville Power Administration, Portland, OR (United States); Colville Confederated Tribes, Nespelem, WA (United States); Bureau of Indian Affairs, Washington, DC (United States). Mar 1995. 79p. Sponsored by USDOE, Washington, DC (United States). (DOE/BP–2552). Order Number DE95009168. Source: OSTI; INIS; NTIS; GPO Dep.

Bonneville Power Administration (BPA) proposes to fund the Hellsgate Winter Range Wildlife Mitigation Project (Project) in a cooperative effort with the Colville Confederated Tribes and the Bureau of Indian Affairs (BIA). The proposed action would allow the sponsors to secure property and conduct wildlife management activities within the boundaries of the Colville Indian Reservation. This Final Environmental Assessment (EA) examines the potential environmental effects of acquiring and managing property for wildlife and wildlife habitat within a large project area. This area consists of several separated land parcels, of which 2,000 hectares (4,943 acres) have been purchased by BPA and an additional 4,640 hectares (11,466 acres) have been identified by the Colville Confederated Tribes for inclusion in the Project. Four proposed activities (habitat protection, habitat enhancement, operation and maintenance, and monitoring and evaluation) are analyzed. The proposed action is intended to meet the need for mitigation of wildlife and wildlife habitat that was adversely affected by the construction of Grand Coulee and Chief Joseph Dams and their reservoirs.

15284 (INIS-mf–14487) **Enhancement of heliothermal systems efficiency.** Draganov, B.; Fara, L. Kievskij Politekhnicheskij Inst., Kiev (Ukraine); Institutul Politehnic, Bucharest (Romania). 1994. 4p. (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627080. Source: OSTI; NTIS (US Sales Only); INIS.

An attempt to solve the problem of optimization of economic indicators of a solar system is presented. The three main subsystems are considered: solar collector, thermal accumulator and heat exchanger. The use of eurystic-algorithmic models is proposed to determine the degree of influence of the most important technological and energetic parameters on the extreme values of system efficiency indicators, as well as to take into account the interaction of various subsystems and the optimum of the entire system. As thermal accumulator the underground system is considered, and a mathematical model is proposed for solving the process of heat exchange and mass transfer in rocks, e.g. filtering of the thermal

agent and its thermal shift. The increase in energy efficiency of solar collectors and heat exchangers is achieved by using rubbed tubes. A strong effect on the heat exchange intensification is caused through flow turbulence which could be increased by transverse prominences. The application of exergetic analysis is proposed for estimating the energetic efficiency of the solar installations and their subsystems. 7 refs. (orig.).

15285 (NEDO-P–9327) **Evaluation and analysis survey on new energy introduction. 3.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 235p. (In Japanese). Order Number DE95769806. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

A detailed study is made on introduction of the photovoltaic power generation system to Japan. The paper analyzes influences of production learning of the equipment, fund subsidies and overseas export production on wide spread of the photovoltaic power generation system, and clarifies the potential amount of the future introduction. The analysis is conducted by converting learning coefficients of battery cell and inverter to 0.7, 0.8 (standard), and 0.9. The cumulative spread of the system by 2040 will amount to 14,911MW, 819MW (standard), 117MW, respectively. The future introduction amount is analyzed by changing exports of the photovoltaic power generation. The cumulative spread of the system by 2040 will increase up to 2,015MW in case of 6% as against 819MW in standard case of 3%. If changing the rate of fund subsidies to 50% (standard), 67% and 75%, the cumulative spread amount will be 819MW (standard), 6,257MW and 10,173MW, and reduction of CO2 emissions will be 1 million t-c/yr, 2 million t-c/yr and 3 million t-c/yr, respectively. 74 figs., 82 tabs.

1404 Environmental Aspects

15286 (BNL–61501) **Environmental and health aspects of copper-indium-diselenide thin-film photovoltaic modules.** Steinberger, H. (Fraunhofer Inst. for Solid State Technology, Munich (Germany)); Thumm, W.; Freitag, R.; Moskowitz, P.D.; Chapin, R. Brookhaven National Lab., Upton, NY (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9405301–1: 5. international symposium on industrial uses of selenium and tellurium, Brussels (Belgium), 8-11 May 1994). Order Number DE95009018. Source: OSTI; NTIS; INIS; GPO Dep.

Copper-indium-diselenide (CIS) is a semiconductor compound that can be used to produce thin-film photovoltaic modules. There is on-going research being conducted by various federal agencies and private industries to demonstrate the commercial viability of this material. Because this is a new technology, and because scant information about the health and environmental hazards associated with the use of this material is available, studies have been initiated to characterize the environmental mobility and environmental toxicology of this compound. The objective of these studies is to identify the environmental and health hazards associated with the production, use, and disposal of CIS thin-film photovoltaic modules. The program includes both experimental and theoretical components. Theoretical studies are being undertaken to estimate material flows through the environment for a range of production options as well as use and disposal scenarios. The experimental programs characterize the physical, chemical e.g. leachability and biological parameters e.g. EC_{50} in daphnia and algae, and feeding studies in rats.

1405 Solar Energy Conversion

15287 (CRIE-T–93073) **Solar cell array design method for preventing power reduction due to module output fluctuation.** Kobayashi, H. (Central Research Institute of Electric Power Industry, Tokyo (Japan)). Central Research Inst. of Electric Power Industry, Tokyo (Japan). Apr 1994. 29p. (In Japanese). Order Number DE95769745. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

A discussion was given on the method to design solar cell arrays to minimize reduction in power output from the arrays caused by variance in the output characteristics of solar cell modules. Measurements verified that the variance in solar array modules causes the fluctuation coefficient of the output current to reach 5% as a maximum, and the reduction in the solar cell array output power can reach about 6% as a maximum. Using the arrangement and connection methods of the modules as parameters, the array output voltage/current characteristics were analyzed by using a simulation. As a result, it was found that an arrangement in which the module output current becomes uniform in the portions where the modules are connected in series in the array circuit, and a method to divide the arrays into blocks are the effective solution. Thus, when the interior of the solar cell arrays was divided into three to four blocks in the series direction, and the modules were arranged by using a simple method to consider the orders of the module output current values, the reduction in the solar cell array output was suppressed nearly completely. 5 refs., 23 figs., 5 tabs.

Dept. of Chemistry and Biochemistry. Mar 1993. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-87ER13791. Order Number DE95009806. Source: OSTI; NTIS; GPO Dep.

This project involves the design, synthesis and study of molecules which mimic some of the important aspects of photosynthetic electron and energy transfer. This research project is leading to a better understanding of the energy conserving steps of photosynthesis via the study of synthetic model systems which abstract features of the natural photosynthetic apparatus. The knowledge gained from these studies will aid in the design of artificial photosynthetic reaction centers which employ the basic chemistry and physics of photosynthesis to help meet mankind's energy needs. The approach to artificial photosynthesis employed in this project is to use synthetic pigments, electron donors, and electron acceptors similar to those found in biological reaction centers, but to replace the protein component with covalent bonds. These chemical linkages determine the electronic coupling between the various moieties by controlling separation, relative orientation and overlap of electronic orbitals. The model systems are designed to mimic the following aspects of natural photosynthetic electron transfer: electron donation from a tetrapyrrole excited single state, electron transfer between tetrapyrroles, electron transfer from tetrapyrroles to quinones, and electron transfer between quinones with different redox properties. In addition, they mimic carotenoid antenna function in photosynthesis (singlet-singlet energy transfer from carotenoid polyenes to chlorophyll) and carotenoid photoprotection from singlet oxygen damage (triplet-triplet energy transfer from chlorophyll to carotenoids).

15289 (DOE/GO–10095-082) **Photovoltaic energy program overview: Fiscal year 1994.** National Renewable Energy Lab., Golden, CO (United States). Mar 1995. 25p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94011871. Source: OSTI; NTIS; GPO Dep.

This is the 1994 overview for the Photovoltaic Energy Program. The topics of this overview include cooperative research projects to improve PV systems and develop pre-commercial prototypes of new PV products, expanding understanding of the fundamental mechanisms governing the formation and performance of PV materials, and helping US industry enhance its leadership position in the PV market.

15290 (LUNKDL-NKVK–95-1005) **Function of minor Chlorophyll a/b-binding protein complexes and regulation of the Xantophyll cycle.** Bratt, C.E. Lund Univ. (Sweden). Dept. of Plant Biochemistry. Mar 1995. 48p. Order Number DE95766673. Source: OSTI; NTIS.

Reconstitution experiments were performed to study the functional role of the chlorophyll protein complex CP29. Photosystem II core preparations and the major light harvesting complex LHCII were incorporated into thylakoid lipids both in the presence and absence of CP29. The energy transfer between the complexes was studied using 77 K fluorescence emission spectroscopy. The results indicated that CP29 facilitates the energy transfer within

photosystem II in the presence of divalent cations. In reconstitution experiments the influence of any detergent present may be an important factor. A method was therefore developed to quantify n-octyl beta-D-glucopyranoside and n-dodecyl beta-D-maltoside content in biological samples using a thin layer chromatography method. In further experiments a copper binding protein was isolated using a fractionation procedure, which included the solubilization of photosystem II particles. The protein was identified as CP26 and was found to have an apparent content of 1 Cu/photosystem II (assuming 250 chlorophylls). EPR measurements suggested oxygen and/or nitrogen as the ligand for the copper. The activity of violaxanthin de-epoxidase was also studied along with its activation by both pH and ascorbate concentration. This enzyme converts violaxanthin to zeaxanthin via the intermediate antheraxanthin in the xanthophyll cycle. Formation of zeaxanthin is believed to protect the plant from excess light by dissipating excess energy. The Km of this enzyme was found to have a strong dependence on pH. This result suggests that the acidic form of ascorbate is the substrate for the enzyme. The release of this enzyme from the thylakoids using sonication was also found to be strongly pH dependent with a cooperativity of 4 with respect to protons. 182 refs, 9 figs

15291 (NEI-DK–1902) **Danish participation in the European Communities concerted actions on PV systems technology and coordination of PV systems development, task 6: Modelling and simulations. Final report.** PA Energy A/S, Malling (Denmark). Feb 1995. 92p. (In Danish, English). Contract ENS-51181-94.0018. Order Number DE95766487. Source: OSTI; NTIS.

The main purpose is to define, develop and test a PC based software complex for simulation, analysis and design of a wide range of solar cell arrays, for instance power net - connected, single and hybrid array systems. ASHLING is a professional software in this field, used in Denmark to simulate the existing Danish solar collector systems with considerable success. Adjustments and modifications of ASHLING make it useful in any country of the world. (EG)

15292 (NREL/TP–411-7497) **Cast polycrystalline silicon photovoltaic module manufacturing technology improvements. Semiannual subcontract report, 8 December 1993–30 June 1994.** Wohlgemuth, J. (Solarex Corp., Frederick, MD (United States)). National Renewable Energy Lab., Golden, CO (United States); Solarex Corp., Frederick, MD (United States). Mar 1995. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004065. Source: OSTI; NTIS; GPO Dep.

This report describes work done under a 3-year program to advance Solarex's cast polycrystalline silicon manufacturing technology, reduce module production cost, increase module performance, and expand Solarex's commercial production capacities. The accomplishments described in this report are as follows: (1) the authors designed modifications to casting stations, ceramic molds, and sizing saws to allow for casting and sizing of larger ingots; (2) they demonstrated the casting of ingots with 17% larger volume; (3) the selected and purchased a new wire saw from HCT Shaping Systems; (4) they demonstrated wafering of eight bricks (2,400 wafers or ~4.4 kilowatts at the cell level) in a 6.5-h run; (5) they demonstrated 14% average cell efficiency in the laboratory using an aluminum paste back surface field; (6) the Automation and Robotics Research Institute (ARRI) completed a modeling study of the Solarex module assembly process; (7) they identified and qualified three new lower-cost back sheet materials through accelerated environmental tests; and (8) they designed and built a test structure for mounting frameless modules, and selected two adhesives and began testing their ability to hold modules to the structure.

15293 (NREL/TP–411-7498) **Photovoltaic Czochralski silicon manufacturing technology improvements. Annual subcontract report, 1 April 1993–31 March 1994.** Jester, T. (Siemens Solar Industries, Camarillo, CA (United States)). National Renewable Energy Lab., Golden, CO (United States); Siemens Solar Industries, Camarillo, CA (United States). Mar 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004066. Source: OSTI; NTIS; GPO Dep.

This report describes work performed under a 3-year, 3-phase, cost-share contract to demonstrate significant cost reductions and improvements in manufacturing technology. The objective of the program is to reduce costs in photovoltaic manufacturing by approximately 10% per year. The work was focused in three main areas: (1) silicon crystal growth and thin wafer technology; (2) silicon cell processing; and (3) silicon module fabrication and environmental, safety, and health issues. During this reporting period, several significant improvements were achieved. The crystal growing operation improved significantly with an increase in growth capacity due to larger crucibles, higher polysilicon packing density, and high pull speeds. Wafer processing with wire saws progressed rapidly, and the operation is completely converted to wire saw wafer processing. The wire saws yield almost 50% more wafers per inch in production, thus improving manufacturing volume by 50% without any additional expense in crystal growth. Cell processing improvements focused on better understanding the contact paste and firing processes. Module designs for lower material and labor costs began with the focus on a new junction box, larger modules with larger cells, and a less costly framing technique. In addition, chlorofluorocarbon (CFC) usage was completely eliminated in the Siemens manufacturing facility during this period, resulting in significant reductions in the cost of caustic waste treatment.

15294 (NREL/TP–411-7682) **Large-area, triple-junction a-Si alloy production scale-up. Semiannual subcontract report, 17 March 1994–18 September 1994.** Oswald, R. (Solarex Corp., Newtown, PA (United States). Thin Film Div.); Morris, J. National Renewable Energy Lab., Golden, CO (United States); Solarex Corp., Newtown, PA (United States). Thin Film Div. This report describes work performed under a 3-year subcontract to advance Solarex's photovoltaic (PV) manufacturing technologies, reduce its hydrogenated amorphous silicon (a-Si:H) module production costs, increase module performance, and expand the Solarex commercial production capacity. During the period covered by this report, Solarex focused on (1) improving deposition of the front contact, (2) investigating alternate feed stocks for the front contact, (3) maximizing throughput and area utilization for all laser scribes, (4) optimizing a-Si:H deposition equipment to achieve uniform deposition over large areas, (5) optimizing the triple-junction module fabrication process, (6) evaluating the materials to deposit the rear contact, and (7) optimizing the combination of isolation scribe and encapsulant to pass the wet high-potential test.

15295 (NREL/TP–411-7695) **Comprehensive research on the stability and electronic properties of a-Si:H and a-SiGe:H alloys and devices. Final subcontract report, 10 March 1991–30 August 1994.** Dalal, V. (Iowa State Univ. of Science and Technology, Ames, IA (United States)). National Renewable Energy Lab., Golden, CO (United States); Iowa State Univ. of Science and Technology, Ames, IA (United States). Apr 1995. 108p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004088. Source: OSTI; NTIS; GPO Dep.

This report describes work on the growth of a-Si:H and a-(Si,Ge):H materials and devices using well-controlled growth techniques. The a-Si:H materials were grown at higher temperatures (300°-375°C) using electron-cyclotron-resonance (ECR) plasma techniques with a remote H beam. These films have excellent electronic quality and show significant improvements in stability compared with glow-discharge-produced a-Si:H materials. Several problems were encountered during the fabrication of devices in these materials, and we were able to overcome them by a systematic work on buffer layers in these cells. We also studied alternative designs for improving the stability of a-Si:H cells and produced graded-gap a-Si:H cells using glow-discharge that are more stable than comparable standard, ungraded glow discharge devices. Finally, systematic work was done to produce good-quality a-(Si,Ge):H films, using triode radio frequency (RF) glow-discharge with ion bombardment during growth. Diagnostic devices were made using these films, and the properties of the material, such as

Urbach energies and hole mobility-lifetime products, were measured in these devices. We found a systematic increase in the Urbach energies, and a corresponding decrease in the hole and electron $\mu\tau$ products, as the Ge content of the alloys increases.

15296 (NREL/TP–412-7680) **Photovoltaic module certification/laboratory accreditation criteria development.** Osterwald, C.R. (National Renewable Energy Lab., Golden, CO (United States)); Hammond, R.L.; Wood, B.D.; Backus, C.E.; Sears, R.L.; Zerlaut, G.A.; D'Aiello, R.V. National Renewable Energy Lab., Golden, CO (United States). Apr 1995. 181p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004063. Source: OSTI; NTIS; GPO Dep.

This document provides an overview of the structure and function of typical product certification/laboratory accreditation programs. The overview is followed by a model program which could serve as the basis for a photovoltaic (PV) module certification/laboratory accreditation program. The model covers quality assurance procedures for the testing laboratory and manufacturer, third-party certification and labeling, and testing requirements (performance and reliability). A 30-member Criteria Development Committee was established to guide, review, and reach a majority consensus regarding criteria for a PV certification/laboratory accreditation program. Committee members represented PV manufacturers, end users, standards and codes organizations, and testing laboratories.

15297 (NREL/TP–413-7684) **Investigation of polycrystalline thin film $CuInSe_2$ solar cells based on ZnSe windows. Annual subcontract report, 15 February, 1993–14 February, 1994.** Olsen, L.C. (Washington State Univ., Richland, WA (United States)). National Renewable Energy Lab., Golden, CO (United States); Washington State Univ., Richland, WA (United States). Mar 1995. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004068. Source: OSTI; NTIS; GPO Dep.

This report concerns studies of CIS solar cells based on ZnSe window layers. ZnSe/CIS devices are fabricated by growing ZnSe films by MOCVD onto Siemens CIS and graded absorber substrates. ZnSe films are grown by reacting H_2Se with a zinc adduct. ZnSe/CIS heterojunctions have been studied by depositing transparent aluminum contacts onto ZnSe. These studies indicate that ZnSe/CIS solar cells can be fabricated with an efficiency greater than 14%. Open circuit voltages are typically larger than 500 mV and the optimum range of ZnSe film thickness for maximum efficiency is between 100 Å and 250 Å. Photocurrents are significantly reduced as the film thickness exceeds 250 Å. Photoluminescence spectroscopy has been utilized to characterize the physical nature of CIS substrate surfaces, and ZnSe-CIS interfaces. These studies indicate that a segregated phase(s) exists at the surface of as received Siemens substrates. Additionally, it is determined that the segregated phase(s) still exist after the ZnSe growth process. To date, sputtered ZnO top contact layers have caused degradation of the photovoltaic properties of the ZnSe/CIS structure. Investigations of the effects of MOCVD grown ZnO upon ZnSe/CIS structures will soon be initiated. To establish the feasibility of ZnSe as a window layer, cells have been fabricated by incorporating a protective layer of CdS between the ZnSe and ZnO. A total area efficiency of 11% was obtained with such a structure.

15298 (NREL/TP–413-7702) **Development of large-area monolithically integrated silicon-film™ photovoltaic modules. Final subcontract report, May 1, 1991–December 31, 1994.** Hall, R.B. (AstroPower, Inc., Newark, DE (United States)); Rand, J.A.; Cotter, J.E. Radiation Systems, Inc., Cleveland, TN (United States). Apr 1995. 27p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004089. Source: OSTI; NTIS; GPO Dep.

The objective of this program is to develop Silicon Film™ Product III into a low-cost, stable solar cell for large-scale terrestrial power applications. The Product III structure is a thin (<100 μm) polycrystalline layer of silicon on a durable, insulating, ceramic substrate. The insulating substrate allows the silicon layer to be isolated and metallized to form a monolithically interconnected array of solar cells. High efficiency is achieved by the use of light trapping and passivated surfaces. This project focused on the development of five key technologies associated with the monolithic sub-module device structure: (1) development of the film deposition and growth processes; (2) development of the low-cost ceramic substrate; (3) development of a metallurgical barrier technology; (4) development of sub-element solar cell processing techniques; and (5) development of sub-module (isolation and interconnection) processes. This report covers the development approaches and results relating to these technologies. Significant progress has been made in the development of all of the related technologies. This is evidenced by the fabrication of a working 12.0 cm^2 prototype sub-module consisting of 7 elements and testing with an open circuit voltage of 3.9 volts, a short circuit current of 35.2 mA and a fill factor of 63% and an overall efficiency of 7.3%. Another significant result achieved is a 13.4% (NREL verified), 1.0 cm^2 solar cell fabricated from material deposited and grown on a graphite cloth substrate. The significant technological hurdle of the program was and remains the low quality of the photovoltaic layer which is caused by contamination of the photovoltaic layer from the low-cost ceramic substrate by trace impurities found in the substrate precursor materials. The ceramic substrate and metallurgical barrier are being developed specifically to solve this problem.

15300 (NEDO-NP–9322) **Investigation research on introducing new energy technology, promoting its practical application, and providing its instruction.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 303p. (In Japanese). Order Number DE95769801. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

For the purpose of smoothly expediting concrete introduction and utilization of new energy technology, the paper investigates and analyzes various kinds of information, and at the same time studies construction of a system to assist giving smooth technical guidance and consultation. Data are arranged on the insolation amount, mean temperature, maximum/minimum temperature collected from 67 weather observatories in Japan. Calculation is made on the insolation amount, and the generated output which is supposed from the latitude angle and the inclination angle of solar cell modules. Examples of introducing the photovoltaic power generation system, including NEDO, are pigeonholed and classified. There are many restrictive conditions at the time of introduction of the photovoltaic power generation. Relations between kinds of places where the technology is introduced and the related legal system are studied. In case of interconnecting to the power system as on-site power generation facilities, the technology should meet requirements of technology of the system interconnection, and therefore study items and equipment policy in case of low-/high-pressure interconnection are arranged. The assistance system is constructed by databasing the data collected, pigeonholed, and analyzed such above. 27 refs., 49 figs., 34 tabs.

15301 (NREL/TP–472-7851) **Building-integrated photovoltaics.** National Renewable Energy Lab., Golden, CO (United States); Kiss Cathcart Anders Architects, New York, NY (United States). Jan 1993. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004056. Source: OSTI; NTIS; GPO Dep.

This is a study of the issues and opportunities for building-integrated PV products, seen primarily from the perspective of the design community. Although some quantitative analysis is included, and limited interviews are used, the essence of the study is qualitative and subjective. It is intended as an aid to policy makers and members of the technical community in planning and setting priorities for further study and product development. It is important to remember that the success of a product in the building market is not only dependent upon its economic value; the diverse group of building owners, managers, regulators, designers, tenants and users must also find it practical, aesthetically appealing and safe. The report is divided into 11 sections. A discussion of technical and planning considerations is followed by illustrative diagrams of different wall and roof assemblies representing a range of possible PV-integration schemes. Following the diagrams, several of these assemblies are then applied to a conceptual test building which is analyzed for PV performance. Finally, a discussion of mechanical/electrical building products incorporating PVs is followed by a brief surveys of cost issues, market potential and code implications. The scope of this report is such that most of the discussion does not go beyond stating the questions. A more detailed analysis will be necessary to establish the true costs and benefits PVs may provide to buildings, taking into account PV power revenue, construction costs, and hidden costs and benefits to building utility and marketability.

1407 Solar Thermal Power Systems

15302 (DOE/GO–10095-085) **Solar thermal electric: Program overview fiscal years 1993–1994.** National Renewable Energy Lab., Golden, CO (United States). Mar 1995. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94000240. Source: OSTI; NTIS; GPO Dep.

The Solar Thermal Electric Program Overview and Accomplishments for Fiscal Years 1993–1994 are documented.

15303 (SAND–94-0785) **Optical performance of the TBC-2 solar collector before and after the 1993 mirror lustering.** Houser, R. (Sandia National Labs., Albuquerque, NM (United States). Solar Thermal Test Dept.); Strachan, J. Sandia National Labs., Albuquerque, NM (United States). Feb 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95008524. Source: OSTI; NTIS; GPO Dep.

In 1993, the mirror facets of one of Sandia's point-focusing solar collectors, the Test Bed Concentrator #2 (TBC-2), were reconditioned. The concentrator's optical performance was evaluated before and after this operation. This report summarizes and compares the results of these tests. The tests demonstrated that the concentrator's total power and peak flux were increased while the overall flux distribution in the focal plane remained qualitatively the same.

15304 (SAND–94-2525) **Results of molten salt panel and component experiments for solar central receivers: Cold fill, freeze/thaw, thermal cycling and shock, and instrumentation tests.** Pacheco, J.E.; Ralph, M.E.; Chavez, J.M.; Dunkin, S.R.; Rush, E.E.; Ghanbari, C.M.; Matthews, M.W. Sandia National Labs., Albuquerque, NM (United States). Jan 1995. 162p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95009085. Source: OSTI; NTIS; GPO Dep.

Experiments have been conducted with a molten salt loop at Sandia National Laboratories in Albuquerque, NM to resolve issues associated with the operation of the 10MW_e Solar Two Central Receiver Power Plant located near Barstow, CA. The salt loop contained two receiver panels, components such as flanges and a check valve, vortex shedding and ultrasonic flow meters, and an impedance pressure transducer. Tests were conducted on procedures for filling and thawing a panel, and assessing components and instrumentation in a molten salt environment. Four categories of experiments were conducted: (1) cold filling procedures, (2) freeze/thaw procedures, (3) component tests, and (4) instrumentation tests. Cold-panel and -piping fill experiments are described, in which the panels and piping were preheated to temperatures below the salt freezing point prior to initiating flow, to determine the feasibility of cold filling the receiver and piping. The transient thermal response was measured, and heat transfer coefficients and transient stresses were calculated from the data. Freeze/thaw experiments were conducted with the panels, in which the salt was intentionally allowed to freeze in the receiver tubes, then thawed with heliostat beams. Slow thermal cycling tests were conducted to measure both how well various designs of flanges (e.g., tapered flanges or clamp type flanges) hold a seal under thermal conditions typical of nightly shut down, and the practicality of using these flanges on high maintenance components. In addition, the flanges were thermally shocked to simulate cold starting the system. Instrumentation such as vortex shedding and ultrasonic flow meters were tested alongside each other, and compared with flow measurements from calibration tanks in the flow loop.

15305 (SAND–94-8235) **NaK pool-boiler solar receiver durability bench test. Volume 2, Metallurgical analysis.** Goods, S.H. (Sandia National Labs., Livermore, CA (United States)); Bradshaw, R.W. Sandia National Labs., Livermore, CA (United States). Jan 1995. 60p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010338. Source: OSTI; NTIS; GPO Dep.

The principal materials used in the construction of a NaKbased pool-boiler were analyzed. The device, operated for 7500 hours, accumulated 1000 thermal cycles to a peak temperature of 750°C. Haynes 230, used to fabricate the pool-boiler vessel, was found to perform satisfactorily. Air-side corrosion of the pool-boiler vessel was insignificant. Internal surface of the alloy exhibited some NaK-induced elemental dissolution; this dissolution was somewhat more extensive where the alloy was exposed to the liquid metal compared to regions exposed only to NaK vapor; however, the corresponding metal loss in all regions was inconsequential, never exceeding more than a few microns. Autogenous seam welds of the alloy responded in a similar fashion, exhibiting only minimal metal loss over the course of the experiment. While there was 50% loss in ductility of the alloy there remained adequate ductility for the anticipated operating environment. An enhanced boiling nucleation surface comprised of stainless steel powder brazed to the vessel ID showed no change in its structure. It remained intact, showing no cracking after repeated thermal cycling. Other materials used in the experiment showed more extensive degradation after exposure to the NaK. IN 600, used to fabricate thermowells, exhibited extensive surface and intergranular dissolution. Grain boundary dissolution was sufficiently severe in one of the thermowells to cause an air leak, resulting in experiment termination. BNi-3, a brazing alloy used to join the pool-boiler vessel, endcaps and thermowells, showed some dissolution where it was exposed to the NaK as well as thermal aging effects. However, all brazes remained structurally sound. A nickel metal ribbon showed catastrophic dissolution, resulting in the formation of deep (> 30 μm) pits and cavities. A zirconium metal foil used to getter oxygen from the NaK became extremely brittle.

1409 Solar Thermal Utilization

15306 (CONF-940326–10) **Modification of the aborption cycle for low generator firing temperatures.** Thornbloom, M.D.; Nimmo, B.G. Florida Solar Energy Center, Cape Canaveral, FL (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC36-86SF16305. From ASME/JSME/JSES international solar energy conference; San Francisco, CA (United States); 27-30 Mar 1994. Order Number DE95010270. Source: OSTI; NTIS; GPO Dep.

Analysis of a solar/electric hybrid absorption cooling system using lithium bromide and water is presented. Addition of a compressor between the evaporator and the absorber allows the system to maintain system capacity in spite of lower generator firing

temperatures provided by flat plate collectors. With the compressor added, the evaporator maintains design pressure and temperature, but increased pressure in the absorber shifts the equilibrium concentration, increasing the amount of refrigerant absorbed. Thus, the solution enters the generator at a more dilute concentration than the case without the compressor. Preliminary analysis shows that less than 250 W to the compressor is needed to increase capacity to 3.52 kW (one ton) from 0.81 kW for typical operating conditions. The system coefficient of performance also increases, and reaches an optimum as compressor power increases. Other compressor issues such as leakage and impeller design are discussed. This design modification improves the feasibility of absorption cooling for use with standard low temperature flat plate collectors.

15307 (DOE/GO–10095-125) **The Department of Energy's Solar Industrial Program: 1994 review.** National Renewable Energy Lab., Golden, CO (United States). Mar 1995. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95004025. Source: OSTI; NTIS; GPO Dep.

This is a report on DOE's Solar Industrial Program. The topics of the report include an overview of the program, it's participants and it's objectives; solar detoxification–using solar energy to destroy environmental contaminants in air, water, and soil; solar process heat–generating industrial quantities of hot water, steam, and hot air from solar energy; and advanced processes–using concentrated solar energy to manufacture high-technology materials and develop new industrial processes.

15308 (DOE/SF/16305–T1) **Open cycle liquid desiccant dehumidifier and hybrid solar/electric absorption refrigeration system. Annual report, January 1993–December 1993. Calendar year 1993.** Nimmo, B.G.; Thornbloom, M.D. Florida Solar Energy Center, Cape Canaveral, FL (United States). [1995]. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC36-86SF16305. (FSEC-CR–713-94). Order Number DE95010172. Source: OSTI; NTIS; GPO Dep.

This annual report presents work performed during calendar year 1993 by the Florida Solar Energy Center under contract to the US Department of Energy. Two distinctively different solar powered indoor climate control systems were analyzed: the open cycle liquid desiccant dehumidifier, and an improved efficiency absorption system which may be fired by flat plate solar collectors. Both tasks represent new directions relative to prior FSEC research in Solar Cooling and Dehumidification.

15309 (DOE/SF/16306–46) **Colorado State University Program for developing, testing, evaluating and optimizing solar heating systems. Project status report for the months of February and March 1995.** Colorado State Univ., Fort Collins, CO (United States). Solar Energy Applications Lab. Apr 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG36-86SF16306. Order Number DE95010486. Source: OSTI; NTIS; GPO Dep.

The current work has been to improve the TRNSYS model temperature and energy predictions for a previous experimental data set collected using the Solhart 180JK system mounted at CSU's Solar Simulator. A successful systematic approach to adjusting the model is described.

15310 (DTU-LV-MEDD–274) **The design reference year. Users Manual.** Danmarks Tekniske Univ., Lyngby (Denmark). Lab. for Varmeisolering. Feb 1995. 22p. Contract EM-1213/88-21. (IEA-SHCP–9E-1). Order Number DE95772359. Source: OSTI; NTIS.

EFP-88.

This manual gives a survey of data available in 'Design Reference Years' (DRY) for some locations in Europe. A DRY is a collection of climate data for a given location for one year, arranged as 8760 sets of hourly, simultaneous weather parameters. DRY's are used as input data for computer simulations of the all-year performance of solar energy systems, and of indoor thermal climate and heating and cooling loads of buildings. DRY's contain, as hourly data: Dry bulb and dew point temperature, global, diffuse and direct normal (beam) irradiance, wind speed and direction, cloud information, and some new parameters measured in routine meteorological systems. The general rule has been to include what is available for the location. Among new data are: illuminance, global, diffuse and beam; 5-min values of direct irradiance, for use with active solar systems; weather forecast data, for simulations of 'intelligent' building energy management systems; and longwave sky radiation. Design Reference Years are, compiled from 12 months of measured climate data for a location, in true sequences within each month. After the selection of 12 months and adjustment procedure has given each month true mean values and variances for the most important parameters, corresponding to the multi-year period form which the DRY-months have been selected, or corresponding to meteorological normals. DRY's have been produced for Oslo, Bergen, Andoya, Stockholm, Copenhagen, and 22 sites in Switzerland. (AB) (14 refs.)

15311 (NEI-DK–1882) **Dannebrogsgade 18, Vesterbro - a project on urban renewal including passive and active solar heating. Results of measurements of conditions of energy and temperature carried out during a period of two years.** Clausen, I.L.; Oestergaard Jensen, S. Dansk Teknologisk Inst., Taastrup (Denmark). Proevestationen for Solenergi. Jan 1995. 100p. (In Danish). Contract ENS-51181-93.0009. Order Number DE95766511. Source: OSTI; NTIS.

The project on urban renewal in Vesterbro, Copenhagen (Denmark), which includes the use of active and passive solar heating, is described and the results of measurements taken of energy and temperature conditions are presented. Measurements are related to a retrofitted block of flats where the balconies have been covered with glass. Solar water heating was also innovated. (AB)

1410 Solar Collectors and Concentrators

15312 (DOE/CE/15601–T1) **Extra focal convective suppressing solar collector. Second quarterly technical progress report.** American Sun Co., Blue Hill, ME (United States). [1995]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-94CE15601. Order Number DE95010170. Source: OSTI; NTIS; GPO Dep.

Second Quarter efforts have focused on completing Task 1 (refining and improving tracking electronics), and working on Tasks 2 and 3 (Optics and Absorber/Fluid System, respectively).

15 GEOTHERMAL ENERGY

15313 (DOE/EE–0043) **Geothermal progress monitor. Report No. 16.** USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). Geothermal Div. Dec 1994. 85p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010519. Source: OSTI; NTIS; GPO Dep.

This issue, the 16th since 1980, illustrates the potential of the liquid-dominated geothermal resource. Achievement of this potential by publicly held companies, who are required to publish financial statements, has involved the use of high-quality resources and the best available technologies or, in some instances, their own innovative modifications of existing technologies as well as a high degree of technical and management expertise. This issue also documents some effects of the new climate of utility deregulation and competition among independent power producers on the geothermal industry. The continuing importance attached to geothermal heat pumps as a preferred space conditioning technology by a number of disparate interests is illustrated by a number of articles. Magma Power Co. reported record gains in both 1993 revenues and earnings over 1992; California Energy has acquired Magma, creating the largest geothermal energy producer in the world. Owing to stagnation in USA, it was decided to focus on international markets. After the introduction, the issue has sections on: Federal beat, industry scene, financing, technology development, direct use technology, state and local, international, technology transfer, and directory.

1501 Resources and Availability

15314 (LA–12903-PR) **Hot dry rock energy: Hot dry rock geothermal development program. Progress report. Fiscal year 1993.** Salazar, J.; Brown, M. (eds.). Los Alamos National Lab., NM (United States). Mar 1995. 54p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009525. Source: OSTI; NTIS; GPO Dep.

Extended flow testing at the Fenton Hill Hot Dry Rock (HDR) test facility concluded in Fiscal Year 1993 with the completion of Phase 2 of the long-term flow test (LTFT) program. As is reported in detail in this report, the second phase of the LTFT, although only 55 days in duration, confirmed in every way the encouraging test results of the 112-day Phase I LTFT carried out in Fiscal Year 1992. Interim flow testing was conducted early in FY 1993 during the period between the two LTFT segments. In addition, two brief tests involving operation of the reservoir on a cyclic schedule were run at the end of the Phase 2 LTFT. These interim and cyclic tests provided an opportunity to conduct evaluations and field demonstrations of several reservoir engineering concepts that can now be applied to significantly increase the productivity of HDR systems. The Fenton Hill HDR test facility was shut down and brought into standby status during the last part of FY 1993. Unfortunately, the world's largest, deepest, and most productive HDR reservoir has gone essentially unused since that time.

1502 Geology and Hydrology of Geothermal Systems

15315 (LA-UR–95-164) **Structural analysis of Precambrian rocks at the Hot Dry Rock Site at Fenton Hill, New Mexico.** Burns, K.L.; Potter, R.M. Los Alamos National Lab., NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950514–11: World geothermal congress: worldwide utilization of geothermal energy, Florence (Italy), 18-31 May 1995). Order Number DE95009436. Source: OSTI; NTIS; GPO Dep.

The subcrop of basement rock at Fenton HIll comprises Precambrian gneiss, schist, amphibolite, pegmatite, and granitoids with affinities in metamorphic and structural history to surface outcrops in the Tusas and Picuris Ranges. Televiewer measurements of structures were analyzed by taking advantage of the spatial continuity of foliations. Folds in the foliation are predominantly conical forms due to interference between structures formed in F2 and F3 tectonic events. Field observations of outcrops in the Picuris Range show that the fractures are predominantly an X-T network controlled by the lithological layering, and statistical evidence indicates that this layer-controlled network persists to depth at Fenton Hill.

1503 Geothermal Exploration and Exploration Technology

15316 (IAEA-TECDOC–788) **Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.** International Atomic Energy Agency, Vienna (Austria). Feb 1995. 268p. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

In the last ten years, geothermal energy has emerged as an alternative source of energy for electrical and non-electrical uses. In some of these countries geothermal energy contributed up to 40% of the national power requirement. In others, it is being widely used in agriculture, aquaculture, air conditioning, kiln and fruit drying, pulp and paper industry, greenhouses and food processing. The Co-ordinated Research Programme (CRP) on the Application of Isotope and Geochemical Techniques to Geothermal Exploration in the Middle East, Asia, the Pacific and Africa aimed at integrating isotope techniques with traditional geochemical and hydrological methods in understanding the characteristics of geothermal systems. It involved isotopic and chemical surveys of hot to cold springs, wells and rivers in exploration areas as well as in exploited reservoirs where problems such as return of injected wastewaters are experienced. This publication is a compilation of the scientific papers presented at the final Research Co-ordination Meeting, held in Dumaguete City, Philippines, from 12 to 15 October 1993. Refs, figs and tabs.

15317 (IAEA-TECDOC–788, pp. 9-20) **Application of isotope and geochemical techniques to geothermal exploration in Southeast China - A review.** Wang Jiyang (Academia Sinica, Beijing (China). Lab. for Geothermics); Pang Zhonghe. International Atomic Energy Agency, Vienna (Austria). Feb 1995. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

Hot springs that are widely distributed in the SE coastal area of China and there have been a subject of dispute on their genesis and origin. Since mid 80's, with the support of the IAEA Research Contracts, isotope and geochemical techniques have been systematically applied to the geothermal systems in the region. The techniques have proven to be very useful and effective in geothermal exploration. ^{2}H and ^{18}O have been employed to study the origin and recharge of the systems, while ^{3}H and ^{14}C have been used to determine the age of the geothermal fluids. Fluid/mineral equilibrium modelling is also useful for the calibration and use of conventional chemical geothermometers and makes reservoir temperature prediction more reliable. Different geothermal systems from Fujian, Guangdong and Hainan Provinces were selected for the study. Results show that the geothermal systems in the study area all belong to the low-medium temperature geothermal systems of convective type, which essentially differs from high temperature geothermal systems with magmatic heat sources underneath. (author). 21 refs, 7 figs, 1 tab.

15318 (IAEA-TECDOC–788, pp. 45-61) **Processes influencing $\delta\ ^{2}H$, $\delta\ ^{18}O$, and Cl distribution in cold and thermal waters in the NW-Peninsula and in the Southern Lowlands, Iceland.** Arnorsson, S. (Iceland Univ., Reykjavik (Iceland). Science Inst.); Sveinbjoernsdottir, A.E.; Andresdottir, A. International Atomic Energy Agency, Vienna (Austria). Feb 1995. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

Data on $\delta\ ^{2}H$ and $\delta\ ^{18}O$ in surface- and cold groundwaters in the NW-Peninsula and in the Southern Lowlands of Iceland plot close to a line with a somewhat shallower slope (6.44) than the meteoric line. The intercept with the $\delta\ ^{18}O$ axis is $\delta\ ^{2}H = -4.4$ per mille. This $\delta\ ^{2}H$ -$\delta\ ^{18}O$ relationship is considered to be representative for today's precipitation in Iceland. Geothermal waters with temperatures of less than about 50 deg. C show very limited, if significant, oxygen shift, whereas hotter waters do, the shift increasing with temperature of some one $\delta\ ^{18}O$ per mille unit for every 100 deg. C. In the NW-Peninsula the marine groundwater component can be accounted for by seawater infiltration into permeable fractures under present-day hydrological conditions. The Cl and B distribution relationships in the geothermal waters indicate that they represent local precipitation, as do the $\delta\ ^{2}H$ data for the NW-Peninsula. In the Southern Lowlands the $\delta\ ^{2}H$ of the geothermal waters is lower than that of local waters. This difference is not considered to reflect recharge areas to the geothermal systems on higher ground inland where today's precipitation is isotopically lighter than that in the Southern Lowlands. The cause is considered to be the presence of a component of "ice-age" water that was precipitated when the climate was significantly colder than today and, therefore, isotopically lighter. It appears that both aqueous B concentrations and the

amount of oxygen isotope shift in the geothermal waters can be used to estimate the amount of rock dissolved by unit mass of these waters. 21 refs, 8 figs, 1 tab.

15319 (IAEA-TECDOC–788, pp. 63-82) **Geochemical and isotope studies of the geothermal areas of central and Northern India.** Navada, S.V. (Bhabha Atomic Research Centre, Bombay (India). Isotope Div.); Nair, A.R.; Sharma, S.; Kulkarni, U.P. International Atomic Energy Agency, Vienna (Austria). Feb 1995. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

Isotope and geochemical studies were carried out in Tattapani geothermal area in Central India. The thermal activity in the area is controlled by the ENE-WSW Tattapani fault and NE-SW cross faults. δD, $\delta^{18}O$ of hot springs and hot water well samples show enrichment compared to the cold springs. Some mixing of the shallow cold waters with the hot waters is possible in some hot springs. Tritium data show that the hot water have a residence time of over 30-40 years. Hot springs of Orissa and Bihar occur on an ENE-WSW lineament zone which is the extension of the zone where Tattapani geothermal area exist. The chemistry of hot spring samples of Bihar are similar to Tattapani geothermal waters. The hot springs of Orissa are high in sodium and chloride due to contribution from a marine source. The isotopic composition of a hot spring sample from Surajkund in Bihar is similar to thermal waters of Tattapani. The thermal water of Badrinath and Tapoban in northern India are situated at an elevation of 2000-3000 m above mean sea level in the Himalayan terrain. Thermal waters from Badrinath are of the NaCl type while those of Tapoban are of the $Ca(HCO_3)$ type. Thermal waters from Tapoban and Badrinath fall near the local meteoric line and show negligible oxygen shift from δD - altitude relationship the recharge area of Badrinath thermal waters is at 3200 m and those of Tapoban thermal waters at 2700 m. (author). 7 refs, 16 figs, 6 tabs.

15320 (IAEA-TECDOC–788, pp. 83-91) **Isotope study in geothermal fields in Java Island.** Wandowo, Z.A. (National Atomic Energy Agency, Jakarta (Indonesia). Center for Applications of Isotopes and Radiation). International Atomic Energy Agency, Vienna (Austria). Feb 1995. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

Study in two geothermal fields, Dieng and Kamojang, in Java island by utilizing isotope technique has been carried out. Isotopic data of wells, springs and other geothermal manifestations providing informations on the recharge area of precipitation contributed to geothermal resources, flow paths and origin of geothermal fluids. The data of oxygen shift has also provided information on the characteristic the fields. (author). 8 refs, 5 figs, 3 tabs.

15321 (IAEA-TECDOC–788, pp. 93-111) **The use of gas chemistry and isotope geothermometry to study the effects of exploitation and reinjection on the fluids at Larderello, Italy.** Panichi, C. (CNR - International Inst. for Geothermal Researches, Pisa (Italy)); Noto, P.; Bellucci, L.; Scandiffio, G.; Baccarin, F.; Valenti, M. International Atomic Energy Agency, Vienna (Austria). Feb 1995. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

Isotopic and chemical analyses of the steam and gas from producing wells since exploration until 1992, were used to define the effects of the exploitation and reinjection of waste fluids. Maps showing zonations of the isotopic composition of the steam and chemical concentrations of the gas mixtures in the Larderello geothermal system are derived independently. Inspection of the maps obtained before and after reinjection reveals good discrimination between the natural inflow of meteroic water subsequent to exploitation and of man-made recharge using waste fluids. Chemical variations of Ar appear to be a valuable tool for evaluating a recovery factor of reinjected water. Isotopic variations in H_2, CH_4 and CO_2 are used to describe disequilibrium conditions between gas components induced by the establishment of a liquid plume at the production zone of the reservoir. (author). 12 refs, 14 figs, 1 tab.

15322 (IAEA-TECDOC–788, pp. 127-147) **Isotopic and chemical studies of geothermal waters of Northern Areas in Pakistan.** Dildar Hussain, S. (Pakistan Inst. of Nuclear Science and Technology, Islamabad (Pakistan)); Ahmad, M.; Akram, W.; Sajjad, M.I.; Gonfiantini, R.; Tasneem, M.A. International Atomic Energy Agency, Vienna (Austria). Feb 1995. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

Northern Areas is one of the major thermal fields of Pakistan with more than two dozen known hot springs having discharge temperature ranging from 35 deg. C to 94 deg. C. Isotopic and chemical techniques applied to study the geothermal fields show that thermal waters are of meteoric origin and can be classified as $Na\text{-}HCO_3$, $Na\text{-}SO_4$ and mixed type on the basis of their chemical contents. At some places cooling of thermal waters seems to be due to steam separation whereas mixing with fresh cold water is prominent at the remaining sites. The temperatures estimated by isotopic and chemical geothermometers for the two major fields i.e. Tatta Pani and Murtazabad are 83-257 deg. C and 65-296 deg. C respectively. (author). 24 refs, 11 figs, 3 tabs.

15323 (IAEA-TECDOC–788, pp. 149-168) **Applications of stable isotopes in geothermal exploration in the Philippines - A review.** Gerardo, J.Y. (Philipinne National Oil Company, Energy Development Corp., Makati, Metro Manila (Philippines). Geothermal Div.); Alvis Isidro, R.R.; Sanchez, D.R.; Clemente, V.C.; Gonfiantini, R. International Atomic Energy Agency, Vienna (Austria). Feb 1995. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

A review of the isotopic data from geothermal exploration areas in the Philippines indicates that the surface thermal waters and well discharges are enriched in heavier isotopes and deviate from the local meteoric water line defined by $\delta^2H = 8\delta^{18}O + (14 \pm 2)$. This enrichment is commonly due to: 1) near surface evaporation; and 2) mixing between meteoric waters and isotopically enriched deep magmatic waters, a phenomenon confirmed by deep well fluids in developed Philippine geothermal systems, such as Tongonan, Palinpinon and Alto Peak. Waters that are isotopically enriched due to the latter are found to be more significant to exploration because in most cases, these are representative of fluids from hotter sources. The dominant process forming these waters can be distinguished by the relationship between stable isotopes and Cl compositions. (author). 27 refs, 12 figs, 3 tabs.

15324 (IAEA-TECDOC–788, pp. 169-184) **Geochemical and isotopic investigation of Biliran geothermal discharges, Philippines.** Ramos Candelaria, M.N. (PNOC-Energy Development Corp., Makati, Metro Manila (Philippines)); Ruaya, J.R.; Baltasar,

A.S.J. International Atomic Energy Agency, Vienna (Austria). Feb 1995. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

The most impressive thermal feature on Biliran island is the Vulcan-Libtong thermal area which hosts a volcano-andesitic hydrothermal system. The chemical signatures of the original andesitic vapors are largely retained in the fluid discharge chemistry and isotope composition. The Vulcan Fault is believed to be the main conduit for the passage of acid andesitic gases from a cooling magma beneath Vulcan to the surface. Away from the Vulcan area, a neutral Cl brine has already evolved by progressive neutralization of a previously acid fluid by intensive water-rock interaction. This neutral water was encountered at depth by wells BN1 and BN2. BN3 drilled close to the Vulcan Fault discharged highly acidic fluids. The main constraint towards the development of the resource is the presence of acid andesitic volatiles at the central portion and the limited area available for exploitation by conventional techniques. (author). 14 refs, 7 figs, 5 tabs.

15325 (IAEA-TECDOC–788, pp. 185-208) **Chemical and isotopic studies of fluids in the Bacon-Manito geothermal field, Philippines.** Ruaya, J.R. Chemical and isotopic data from springs rainfall and wells have been used to characterize the fluids and to identify the major reservoir processes at Bacon-Manito geothermal field, Philippines. The deep reservoir fluid is postulated to be heated to about 325 deg. C and have 7500-8500 mg/kg chloride. Its chemical and isotopic composition is best characterized by wells OP-3D and OP-4D. Spring isotopic data show that their discharges are predominantly meteoric in origin, with a few following a simple evaporation trend. Chloride-enthalpy and chlorid-$\delta^{18}O$ relations reveal that the upflowing geothermal reservoir fluid undergoes: (1) dilution with meteroic water, (2) conductive cooling as these move away, (3) mixing with steam condensate, and (4) vapor gain. Well gas chemistry points to the absence of direct magmatic contributions while it is shown that the equilibrium reaction $CH_4 + 2H_2O = CO_2 + 4H_2$ is likely to be established. The observed positive ^{18}O shifts of well waters relative to the local water meteoric line were considered to be due primarily to mixing of deeply-seated "andesitic" and meteoric waters while water-rock interaction could not be ruled out. Finally, a conceptual geochemical model of the geothermal system is proposed. (author). 21 refs, 12 figs, 5 tabs.

15326 (IAEA-TECDOC–788, pp. 209-231) **Isotopic and chemical composition of waters and gases from the east coast accretionary prism, New Zealand.** Giggenbach, W.F. (Institute of Geological and Nuclear Science, Lower Hutt (New Zealand)); Stewart, M.K.; Lyon, G.L.; Sano, Y.; Goguel, R.L. International Atomic Energy Agency, Vienna (Austria). Feb 1995. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

Gases and saline waters discharges from springs and mud volcanoes along the east coast of the North Island of New Zealand provide a unique opportunity to study the evolution of fluids within an active accretionary prism. The waters show intermediate (5000 mg Cl/kg) to high (26,000 mg Cl/kg) salinities and are enriched in both deuterium ($\delta\ ^2H$ from -20 to -2 per mille) and oxygen-18 ($\delta^{18}O$ from +3 to 7 per mille) with respect to local groundwater. Cl/Br ratios are with 250±50 close to those of seawater (285), B/Cl ratios are higher than those of seawater (0.0003) and range from 0.003 to 0.03 at comparatively uniform Li/B ratios of 0.05 ± 0.03. Relative Na, K and Mg contents suggest close attainment of water-rock equilibrium at temperatures of 85 ± 25 deg. C. Gas geothermometers (CO_2, CH_4, Ar) indicate equilibration in the liquid phase at somewhat higher temperatures of 100 ± 20 deg. C. Ratios of $^3He/^4He$ in gases from the central sector reach values of 3.35 R_A indicating the presence of about 40% of mantle He. Significant amounts of N_2 appear to be added from other than atmospheric sources. Formation of the highest Cl water (26,000 mg Cl/kg) is explained in terms of the hydration of basalt of a subducted seamount to form chlorite or serpentine. The isotopic and chemical compositions of the waters in the subducting sediments are compatible with the assumption that they form the main source for the magmatic components of waters discharged from andesitic volcanoes and associated geothermal systems. (author). 37 refs, 9 figs, 3 tabs.

15327 (IAEA-TECDOC–788, pp. 232-248) **Isotope and geochemical survey of geothermal systems of Yozgat province in Central Anatolia, Turkey.** Simsek, S. (Hacettepe Univ., Ankara (Turkey). International Research and Application Center for Karst Water Resources (UKAM)). International Atomic Energy Agency, Vienna (Austria). Feb 1995. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

In Central Anatolia, which is subject to this project area, there are many geothermal fields. Turkish State Planning Organization (DPT) gives priority and encouragement to the investments of tourism and energy production. Our studies, in Central Anatolia are planned to focus on mainly Yozgat- Nevsehir region. But only Yozgat province results will be given in this paper. Detailed hydrogeological and hydrogeochemical studies have been carried out and periodic hydrogeochemical analyses made in Hacettep University International Research and Application Center for Karst Water Resources (UKAM) Laboratories. Analyses of samples (^2H, ^{18}O, ^3H) which were periodically collected from thermal and cold water spots in the project area have been made in IAEA. Hydrogeologic models for important geothermal fields in Yozgat region have been realized as a result of this study. Following are the results obtained from the isotopic evaluations of the geothermal fields: According to the $\delta^{18}O$ vs. δ^2H relation of rain and snow water samples, the project area represents a climatic transition zone between the East Mediterranean and Central Anatolia Climatic · Geographic Regions by the local meteoric line equation of $\delta^2H=8*\delta^{18}O+14$; according to the tritium analyses, thermal waters have deep and long groundwater flow paths and these waters are generally older than 50 years; according to the $\delta^{18}O$ vs. δ^2H relation, there are ^{18}O shift in Yozgat-Saraykent, Bogazliyan and Sorgun; Yozgat-Saraykent, Sorgun and Bogazliyan geothermal fields are important for geothermal applications as mainly central heating and balneological utilization possibilities. (author). 21 refs, 12 figs, 4 tabs.

15328 (IAEA-TECDOC–788, pp. 249-267) **Preliminary geochemical and isotopic study of the South Trungbo geothermal area in Central Viet Nam.** Nguyen Tract Viet (Centre for Nuclear Technique Application, Ho Chi Minh City (Viet Nam)); Nguyen Kein Chinh; Huynh Long; Nguyen Dieu Minh; Phan Thanh Tong. International Atomic Energy Agency, Vienna (Austria). Feb 1995. Contract IAEA-R-5840/RB. (CONF-9310427–: Final research co-ordination meeting on the application of isotope and geochemical techniques to geothermal exploration in the Middle East, Asia, the Pacific and

Africa, Dumaguete City (Philippines), 12-15 Oct 1993). In *Isotope and geochemical techniques applied to geothermal investigations. Proceedings of the final research co-ordination meeting held in Dumaguete City, Philippines, 12-15 October 1993.* 268p. Order Number DE95627729. Source: OSTI; NTIS (US Sales Only); INIS.

Stable isotopes (deuterium and oxygen-18) as well as geochemical data from South Trungbo geothermal area have been studied in order to deal with the chemistry classification, recharge area of hot waters and reservoir temperature. From geological and geomorphological point of view, hot waters are divided into two groups, corresponding to two zones: Coastal Strip and Northern Highland. According to stable isotopes, the recharge area of hot waters occur at about 500-600m a.s.l and 700-900m a.s.l for two above zone respectively. Moreover, there is no evidence for isotopic exchange between hot waters and host rock. Several classical geothermometers such as chalcedony, quartz, Na-K, Na-K-Ca as well as the mixing model given by Fournier and Truesdell have been applied to estimate the reservoir temperature. The results obtained are less than 150-180 deg. C. Both geochemical and isotopic data indicate that the South Trungbo is a low-enthalpy geothermal system. (author). 7 refs, 7 figs, 6 tabs.

15329 (INIS-mf–14509) **Geothermal energy in Jordan.** Al-Dabbas, Moh'd A. F. Ministry of Energy and Mineral Resources, Amman (Jordan). Nov 1993. 15p. Order Number DE95628112. Source: OSTI; NTIS (US Sales Only); INIS.

The potential of geothermal energy utilization in Jordan was discussed. The report gave a summary of the location of geothermal anomalies in Jordan, and of ongoing projects that utilize geothermal energy for greenhouse heating, fish farming, refrigeration by absorption, and water desalination of deep aquifers. The problems facing the utilization of geothermal energy in Jordan were identified to be financial (i.e. insufficient allocation of local funding, and difficulty in getting foreign financing), and inadequate expertise in the field of geothermal energy applications. The report gave a historical account of geothermal energy utilization activities in Jordan, including cooperation activities with international organizations and foreign countries. A total of 19 reports already prepared in the areas of geochemical and hydrological studies were identified. The report concluded that the utilization of geothermal energy offers some interesting economic possibilities. (A.M.H.). 4 refs. 1 map.

(Ministry of Energy and Mineral Resources, Amman (Jordan)); Masarwah, Rober; Elkarmi, Fawwaz. Ministry of Energy and Mineral Resources, Amman (Jordan). Aug 1993. 11p. Order Number DE95628113. Source: OSTI; NTIS (US Sales Only); INIS.

A proposal for the exploration of geothermal energy in Jordan for heating greenhouses. The report gives some background information on geothermal anomalies in Jordan, and outlines some on-going uses of geothermal energy in various parts of Jordan. The proposal is modelled on the 2664 square meter Filclair Super 9 Multispan greenhouse from France. The overall cost of the project involves three variables, the cost of the borehole, the cost of the greenhouse, and the cost of engineering services. The total cost ranges between three to four million dollars depending on the quantity and quality of information to be collected from the borehole. The advantages of geothermal heating compared with oil heating are emphasized. The project will enable geothermal heating and horticultural production to be monitored throughout the year, will produce data enabling rational and reliable water resources management, and will produce environmentally clean and efficient energy. 15331 (DOE/ER/14115–T1) **Electrochemical determination of the Gibbs free energies of rock-forming minerals. Final report.** Anovitz, L.M. Arizona Univ., Tucson, AZ (United States). Dept. of Geosciences. [1994]. 46p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-90ER14115. Order Number DE95009682. Source: OSTI; NTIS; GPO Dep.

This grant provided support for a series of measurements of thermodynamic data for rock-forming minerals using an electrochemical approach. The relative accuracy of electrochemical measurements and the fact that this technique is the only one that directly measures the Gibbs energy of a phase as a function of temperature makes data obtained in this manner ideal for many types of geochemical calculations. A laboratory for these measurements was completed, and data were acquired on a series of metal-oxide buffers. Data were obtained with precisions of approximately ±20 J/mole O_2 at a single temperature, and fitted precisions of ±50 J/mole O_2. Tests of the accuracy of these data were completed by running relative to air, to air through an intermediate gas stage, and relative to a solid buffer, and temperatures were calibrated relative to a primary standard obtained from NIST. These tests suggested that precision of currently available electrochemical studies may not reflect the accuracy of these measurements. The chemical potential of oxygen measured at any given temperature for all solid buffers tested appears to be a direct function of the voltage across the electrolyte containing the solid sample. Further tests of this effect, and recalibration of most or all of these reactions are needed if truly accurate data for these basic reactions are to be available. Preliminary to a planned electrochemical measurements on pyroxenes, a thermodynamic model of the system diopside-enstatite was derived. These results suggest that the activity/composition relations derived from solvus data are strongly dependent on the thermodynamic formulation chosen. This appears to be especially true for ordered intermediate compositions like diopside.

15332 (BNL–61531) **Biochemical processing of geothermal brines and sludges.** Premuzic, E.T.; Lin, M.S.; Lian, H. Brookhaven National Lab., Upton, NY (United States). Mar 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950388–1: 13. geothermal program review, San Francisco, CA (United States), 13-16 Mar 1995). Order Number DE95009652. Source: OSTI; NTIS; GPO Dep.

Development of cost-efficient biochemical processes for the treatment of geothermal brines and sludges has led to the identification of several options which allow one to convert geothermal wastes into useful products. A laboratory scale pilot plant operating in a batch mode has been constructed and used to extract and recover toxic and valuable metals and metal salts from geothermal residues. Metal extraction and recovery efficiencies of better than 80% per five to twenty-five hour treatment cycles have been achieved. The new technology is versatile and can be applied to brines and sludges derived from hypersaline as well as low salinity resources. The biochemical processes can be integrated with existing facilities, allow recycling options, and yield revenue generating feedstocks and waste volume reduction. Selected versions of this technology are now being readied for field trials. Recent advances and the current status of the emerging technology will be discussed in this paper.

The general characteristics of the offshore wind climate is somewhat different from the onshore situation. The rather small values for surface roughness encountered at sea are responsible for higher wind speeds and reduced turbulence intensities. There are a number of interesting problems associated with this environment: The surface roughness of the sea is quite well known for open ocean conditions, but in the near-shore situation we would expect somewhat different (higher) values because of changed wave structure with breaking and refracting waves near the coast. The lower turbulence levels should consume less of the fatigue life of the turbines, but the wakes from upstream turbines will disperse more slowly and maintain larger velocity gradients than for the corresponding situation in a conventional wind farm. Are these effects significant? How far away from the coast should the wind farm be placed such that wind from land has accelerated to a value sufficiently close to its equilibrium open sea value. In the following we will concentrate on the first two problems, surface roughness and turbulence, and touch briefly on third problem. (EG)

In this paper we have considered data series of wind and temperature from five stations located at the west coast of Sardinia. We have estimated stability conditions frequency and wind distributions and found that sites located within an area of few kilometres of radius can have different characteristics. Furthermore we have noticed that on the contrary of north European regions, in such atypical Mediterranean area horizontal variation of temperature can be very strong and become the most important parameter to explain the mentioned differences. We have focused on one of the areas and applied the EEC model WAsP to simulate the wind distributions within it. The model does not give reliable results. From the experimental results, we guess that this is mainly due to the two constraints on which WAsP is based namely same surface geostrophic climatology and same stability within the considered region of application. Starting from this argument we could try to identify areas that can fulfill WAsP conditions and apply the model within the area. This could be achieved by using prognostic mesoscale models and good surface and upper-air databases. (au) (12 refs.)

Within the business of wind turbine energy the accurate measurement of wind speed is an important but difficult exercise. To estimate the energy with sufficient confidence anemometers used to measure the wind speed must usually be calibrated in a wind tunnel, where the anemometer signal can be related to the wind speed via a pitot-static tube (and other instruments). Furthermore, the accuracy must be maintained through periodic calibration since most anemometers are subjected to wear and tear, which may change the properties. In the present method the anemometers are tested purely mechanical rather than using the wind tunnel. Only a sample of 2-3 anemometers shall be calibrated in the wind tunnel. Then the measured calibration characteristic can be generalized with sufficient accuracy by subjecting all anemometers to appropriate quality assurance (QA). All anemometers must be checked periodically, whereas the wind tunnel calibration of the test sample need only be carried out once. The QA-system under development at The Test Station for Wind turbines at Risoe National Laboratory is base on measuring the mechanical friction and inspecting the anemometer cups by means, which can be established in any workshop. The THERMIE European Community programme is designed to promote the greater use of European technology and this catalogue contributes to the fulfillment of this aim by dissemination of information on 50 wind turbines from 30 manufacturers. These turbines are produced in Europe and are commercially available. The manufacturers presented produce and sell grid-connected turbines which have been officially approved in countries where this approval is acquired, however some of the wind turbines included in the catalogue have not been regarded as fully commercially available at the time of going to print. The entries, which are illustrated by colour photographs, give company profiles, concept descriptions, measured power curves, prices, and information on design and dimension, safety systems, stage of development, special characteristics, annual energy production, and noise pollution. Lists are given of wind turbine manufacturers and agents and of consultants and developers in the wind energy sector. Exchange rates used in the conversion of the prices of wind turbines are also given. Information can be found on the OPET network (organizations recognised by the European Commission as an Organization for the Promotion of Energy Technologies (OPET)). An article describes the development of the wind power industry during the last 10-15 years and another article on certification aims to give an overview of the most well-known and acknowledged type approvals currently issued in Europe. A replacement program has been initiated in Denmark. The aims and spin-offs of this program are: removal of old and small wind turbines scattered sited in the open land, mitigation of neighbor complains, mitigation of the small but increasing public disapproval of wind turbines, an enlarged total MW-potential, a stimulation of the wind turbine market, and an economical relieve of pioneer wind turbine owners. The replacement program is based on subsidies to owners who are replacing their old or misplaced turbines. Five month into the program 16 turbines have been replaced, and 3.5 MW of wind power capacity has been added. (au)

15342 (NEI-DK–1955) **Vibration and noise analysis of gearbox for NTK 500/37 wind turbine.** Crone, A. Oedegaard og Danneskiold-Samsoee ApS, Copenhagen (Denmark). Mar 1995. 20p. Contract ENS-1364/91-0010. Order Number DE95772375. Source: OSTI; NTIS; INIS.

EFP-91.

The overall aim was to to develop methods for the description of the structure-borne noise-source strength of wind turbine gearboxes. A gearbox manufactured by Jahnel-Kestermann for a 500 kW "Nordtank" wind turbine was examined. Intensive vibration tests of the gearbox were carried out at the test bed at the manufacturer's factory and nose emission from the wind turbine was measured when the gearbox had been remounted. The main results of the study are presented. Vibration measurements made on the gearbox for NTK 500/37 showed an average velocity level at the tooth mesh frequency of the output gear stage of L_v = 105 dB / 1 nm/s on the input bearing housing in load conditions corresponding to a wind speed of 8 m/s, 10 m above ground. Evaluation of the influence of load on the gearbox vibration showed a minimum velocity level at a torque corresponding to a wind speed of 6 - 7 m/s, 10 m above ground (160 kW). This is evaluated as ideal. Velocity levels at the harmonics of the tooth mesh frequencies may change by more than 10 dB in a speed range close to the operational speed. Changes are due to natural vibration modes in the gearbox structure. After remounting of the gearbox, noise measurements showed a noise emission level of $L_{WA,ref}$ = 99 dB /1 pW. Tonal components were identified in the noise spectrum at frequencies corresponding to the 1st and 3rd harmonics of the tooth mesh frequency of the output gear stage (approx. 604 Hz, and 1808 Hz). Noise transmission of structure born noise from the gearbox to the exterior of the wind turbine was evaluated as average. (AB)

EFP-90; EFP-91.

The investigations had several purposes: Firstly, to determine and evaluate the structure-borne noise source strength of the gearbox, which is relevant for the final gear noise emission from the wind turbine. Secondly, to select the potentially least noisy gear set out of two, which have been made for the output gear stage. And Thirdly, to obtain the natural vibration modes of the gearbox structure, in order to determine if the structure-borne noise, transmitted to the wind turbine structure, will be amplified due to resonance conditions. Additional vibration tests were carried out. Among these, trials of 'in situ' measurement of the Transmission Error of the output gear stage, and measurements of the torsional vibrations of the input and output shaft. The test of the two output gear sets (from Flender AG and ELKRAFT A.m.b.A.) had the aim to determine the least noisy one of two different tooth profiles. Both gear sets were intended for the Avedoere Wind Turbine when it, in its first period of operation, is going to operate as a stall regulated turbine. After the first mesurements and the exchange of the Flender-designed gear set with the ELKRAFT-designed gear set, troubles with the backmost bearing of the intermediate shaft arose. The evaluation of the structure-borne noise source strength (expressed as the vibration velocity level), has in general been made at load conditions which correspond to the conditions in the wind turibne at a wind speed of 8 m/s, 10 m above terrain (v_{10}). This condition, is the one normally used when the noise emission from wind turbines is evaluated. At the comparison of the two gear sets against each other, the influence of the torque load on the source strength has also been considered. This comparison may indicate the load at which the profile correction is most effective, and may determine the noise potential of the gearbox at wind speeds lower than 8 m/s, which could also be of interest. 15345 (NEI-DK–1877) **Improvements on the power characteristics of the small scale wind turbine FC-4000 wind motor.**

Schmidt, D. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Oct 1994. 43p. Contract ENS-UVE-90.0047. Order Number DE95766509. Source: OSTI; NTIS.

The following report is an extract from the German report 'Verbesserung der Leistungscharakteristik der Kleinwindkraftanlage FC - 4000 Wind Motor', written after work in the Folkecenter for Renewable Energy /Denmark from April 11 to October 1 1994. If there is some special interest in the FC - 4000 in general, the reports about the FC -4000 mentioned in reference of this report are recommended. The FC - 4000 Wind Motor belongs to the series of small scale wind turbines, developed by the Folkecenter for Renewable Energy for Application under different climatic conditions, like the extremely high wind regimes in the Arctic, the low wind regimes in the Tropics and the medium wind regimes like in Denmark. The FC - 4000 Wind Motor is a 1.5 kW wind turbine, designed for low wind regimes. It has a wide range of applications such as grinding, water pumping, cooling or battery charging. (EG) (22 refs.)

15346 (NEI-DK–1943) **Grid-connection of wind turbines and wind farms.** Koelbaek Jensen, K. Danske Elvaerkers Forenings Udredningsafdeling (DEFU), Lyngby (Denmark). Jun 1993. 15p. Order Number DE95766548. Source: OSTI; NTIS.

Power generation by wind turbines is controlled by several parameters. Changes in the stationary voltage levels, voltage fluctuations, inrush currents, voltage regulation in HV/MV substations, reactive power compensation and short circuits are all essential for efficient grid connection of wind turbine arrays. (EG)

15347 (NEI-DK–1971) **Aerodynamics of wind turbines.** Maribo Pedersen, B. (ed., Technical University of Denmark. Dept. of Fluid Mechanics, Lyngby (Denmark)). Danmarks Tekniske Univ., Lyngby (Denmark). Afd. for Fluid Mekanik. 1994. 359p. Contract ENS-1364/93-0001. (CONF-9411219–: 8. Symposium on aerodynamics of wind turbines, Lyngby (Denmark), 21-22 Nov 1994). Order Number DE95772389. Source: OSTI; NTIS.

EFP-93; JOULE-2.

Twenty three papers presented by participants at the 8th symposium on Aerodynamics of Wind Turbines held in Lyngby (Denmark) on November 21-22 1994 under the implementing agreement for cooperation in the research and development of wind turbine systems Annex XI (International Energy Agency. IEA Joint Action). (AB)

15348 (NREL/TP–441-7805) **Wind turbine trailing edge aerodynamic brakes.** Migliore, P.G. (National Renewable Energy Lab., Golden, CO (United States)); Miller, L.S.; Quandt, G.A. National Renewable Energy Lab., Golden, CO (United States). Apr 1995. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-950309–2: 25. annual conference and exhibition on wind power, Washington, DC (United States), 26-30 Mar 1995). Order Number DE95004061. Source: OSTI; NTIS; GPO Dep.

Five trailing-edge devices were investigated to determine their potential as wind-turbine aerodynamic brakes, and for power modulation and load alleviation. Several promising configurations were identified. A new device, called the spoiler-flap, appears to be the best alternative. It is a simple device that is effective at all angles of attack. It is not structurally intrusive, and it has the potential for small actuating loads. It is shown that simultaneous achievement of a low lift/drag ratio and high drag is the determinant of device effectiveness, and that these attributes must persist up to an angle of attack of 45°. It is also argued that aerodynamic brakes must be designed for a wind speed of at least 45 m/s (100 mph).

15349 (RISO-R–670(EN)) **Dynamic stall measurements on a 19 m diameter HAWT.** Aagaard Madsen, H.; Schmidt Paulsen, U. Risoe National Lab., Roskilde (Denmark). Test Station for Wind Turbines. Feb 1995. 33p. Contract ENS-1364/92-0001; Contract ENS-1364/91-0001; Contract E Order Number DE95766519. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

EFP-92; EFP-91; EFP-90.

The main objective of the present project has been to provide detailed experimental results on dynamic stall and stall hysteresis on a stall regulated wind turbine. Such data are of big importance for the development and validation of engineering stall hysteresis models. The experimental set-up which is implemented on a 19 m diameter stall regulated rotor with a rated power of 100 kW has been developed in a previous project. The main features are a system for measuring the aerodynamic forces on three blade segments of the blade and a five hole pitot tube mounted on the rotating blade for measuring the angle of attack and the relative inflow velocity vector. Measurements have been performed in yawed conditions as well as during normal operation. For operation in yaw regular stall hysteresis loops have been measured with characteristics corresponding quite well to the elements in the Beddoes stall delay model. In normal operation the loops are much more irregular. In order to estimate the importance or stall hysteresis in this situation, the variance of a simulated aerodynamic load based on the measured quasi steady C_N vs. α curve was compared with the variance of the actual measured aerodynamic force. The variance of the measured force turned out to be about 30 % higher than the force derived on quasi steady aerodynamics. Finally, flow visualization with tufts has been carried out and correlated with inflow measurements. In this way, the position of the separation line as function of measured angle of attack has been found. (au) (1 tab., 32 ills., 8 refs.)

15350 (RISO-R–797(EN)) **Contributions from the Department of Meteorology and Wind Energy to the EWEC'94 conference in Thessaloniki, Greece.** Larsen, G.C. (ed.). Risoe National Lab., Roskilde (Denmark). Meteorology and Wind Energy. Jan 1995. 136p. (CONF-941050–: EWEC'94: 5. The 5'th European Wind Energy Association Conference and Exhibition - EWEC'94 - was held in Thessaloniki, Greece during the period 10-14 October 1994. 461 delegates, mainly from Europe but also from other parts of the world, attended the conference. The conference contributions included 235 oral presentations and 143 posters. The Department of Meteorology and Wind Energy contributed with 18 oral presentations and 3 poster with members of the department as authors or co-authors. The present report contains the full set of these papers, covering a wide spectrum of subjects including wind resources, reliability and load assessment, grid connection, wind-diesel systems, and marked aspects. This paper will describe a project that has as its main task to implement prediction of the power produced by wind farms in the daily planning at a utility. The predictions are generated from forecasts from HIRLAM (High Resolution Limited Area Model) of the Danish Meteorological Institute. these predictions are then made valid at individual sites (wind farms) by applying a matrix generate by the submodels of WA^{s}P (Wind Atlas Application and Analysis Program). In the project 17 wind farms have been selected for study. The farms are located on Zealand (13) and Bornholm (4) islands and all belong to the Danish utility ELKRAFT/Sjaellandske Kraftvaerker. (au)

Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

Three types of non-destructive tests have been exploited to determine mass distribution, stiffness distribution, and mode shapes of a wind turbine glade in order to improve the test procedures in the Danish certification system. While the blade is mounted in a rigid test stand for the standard strength and fatigue test, the test programme is easily extended to include an investigation of the above structrual properties. The mass distribution is determined based on the difference in strain gauge signals due to a 180 degrees rotation of the tip, and the mode shapes are determined from registrations of blade accelerations originating from a sinusoidal excitation of the blade, fine tuned to the relevant natural frequency. The method is redundant, and an easy test of the overall accuracy is performed by comparing the ratio between the generalized mass and the generalized stiffness to the square of the relevant natural frequency. This paper describes the work of the JOULE II project 'Dynamic Stall and Three-Dimensional Effects'. An overview of the work is given. The goal of this project is to produce engineering methods for the calculation of stalled flow of horizontal axis wind turbines. Engineering methods in this context means that the methods should be suitable for implementation in current programs for aeroelastic calculations. The project is divided into three tasks: 1. Experiments. 2. Calculations with codes that can give detailed information on the flow of a stalled rotor and development. 3. Engineering methods. Experimental results for the 75% radius of wind turbines are presented and discussed. 3D calculations are shown to be able to predict the static stall delay at small radius of the turbine. Calculations with three dynamic stall models are shown to give good agreement with measurements on a NACA 43415, a LS(1)-0421 MOD and a SERI 809 aerofoil. (au) (17 refs.)

In the mid and late eighties experimental campaigns were initiated in different countries. In order to investigate some earlier findings concerning the importance of the 3D, rotaional and unsteady effects on the operational characteristics of HAWTs working in natural conditions. The above measurements as well as some more recent measurements show clearly that the 3D, rotational and unsteady effects, are indeed the source of the uncertainty in modelling and predicting the aerodynamic loads on the HAWTs. In order to investigate one of the above mentioned topics we are attempting in this paper to model the unsteady effects in the stalled regime aiming to the understanding of the related physics. A dynamic stall model which is based on a 3 D primitive variables Navier-Stokes solver is used for this reason. Numerical results are compared against experimental and computational results of the open literature, as well as against the experimental results for a HAWT setup. (au) (19 refs.)

The paper presents work concerned with investigation of the quality of synthetic generated turbulence used as input to aeroelastic simulation programs. Measured and synthetic turbulence generated by two models, which basically differ in the number of represented wind components, is compared. The turbulence is represented as the local wind vector at a cross section of a rotating wind turbine blade in natural wind. The results confirm that the transversal turbulence component is important for realistic representation of the local wind vector and subsequently for derived quantities as e.g. fatigue damage. (au)

The blade tip region is of high importance for the rotor power production, the blade loading and the noise emission. Wind turbine performance can thus be significantly influenced (improved) by the choice of the right tip shape. In this report experimental and numerical results are presented. The experimental results comprise load and inflow measurements conducted on a 100 kW wind turbine Tellus T-1995 which has been used as a test bed. The results

from the different tips are to be compared to those of the rotor's standard tip. The numerical results presented have been reached by using the commercial Navier-Stokes code FIDAP and comprise calculations of the laminar flow field around the tips. (au) (11 refs.)

Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

The Danish certification system for wind turbines has requirements to testing of wind turbines which is described as basic and system testing. It has been the practice in the past few years that the loads on the 500 kW wind turbine generation were verified for each wind turbine type by measurements, which has meant system testing of quite a number of wind turbines. Therefore, it was decided to put up a testing program that incorporates calculations with aeroelastic codes into the certification process. The present paper describes a testing procedure, called concept testing, which is based on the applicability of aeroelastic codes to reduce the number of system tests necessary to perform on wind turbines of the same concept. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

The main objectives of the project are to (1) complement the existing base of wind farm data by gathering information on wind speed deficit, turbulence and structural loads at the Vindeby offshore wind farm to investigate the structure of single and multiple wakes under the ideal homogeneous, low-ambient turbulence conditions found offshore, and thus be able to model wake behavior more correctly, and (2) to be able to characterize turbulence and shear in the incoming flow as a function of upstream turbine separation to be utilized in design standards for calculation of loads on wind turbines to be located offshore. From a statistical point of view few data are a present available. However, it is possible to get some indications of the flow environment in and around the wind farm. First, we take a brief look at some efforts made in modelling wind speed deficit and turbulence increase in wind farms and thus what could be expected in the presumed low-turbulence flow at sea. Secondly, measurements of wind speeds and turbulence mad at the two offshore meteorological towers is presented, and finally measurements of the so-called equivalent stress width - calculated from flapwise root bending moments of the two instrumented wind turbines - are presented. Power system expansion planning should determine the optimal power system mix including wind power, ideally containing cost of energy comparisons as well as estimates of economics for the society, including externalities. The analyses should be made for all relevant expansion scenarios supplying power at similar and acceptable reliability throughout the lifetime of equipment. This paper addresses the requirements to modelling in general and suggests a modelling approach attempting to take adequate account of statistical variations and uncertainties in input and assumptions as well as influence of future development scenarios. The paper particularly studies the question whether a change of or large uncertainty in the assumed development of consumer loads over a 20 year period has or should have an influence on decisions to invest in wind power capacity up to high penetration levels. A dedicated model for power system performance modelling when studying the impact of wind power up to high penetration levels, WINSYS, is presented and described in the paper. Recommendations regarding need for methodologies for studying system expansions with wind power are discussed for both small and large power systems. (au)

15364 (RISO-R–797(EN), pp. 118-124) **On power quality measures for wind-diesel systems. A conceptual framework and a case study.** Bindner, H.W. (Risoe National Lab., Test Station for Wind Turbines, Roskilde (Denmark)); Lundager, P. Risoe National Lab., Roskilde (Denmark). Meteorology and Wind Energy. Jan 1995. (CONF-941050–: EWEC'94: 5. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

By their definition wind diesel systems are electrical power supply systems with variations of both voltage and frequency of the grid. In order to evaluate prospective systems designs in terms of power quality and compare with alternatives in a rational way it is necessary to work within an agreed framework of definitions of the measures to be applied. This paper contributes to the development by presenting a conceptual framework for power quality in terms of

both grid frequency and voltage in a time scale, where system dynamics in the usual sense is included, but switching and harmonics are not considered. Concerning voltage variations the proposed framework rests on previous work (e.g. CENELEC) and current work (DEFU/Risoe and Mayer/Joule II), and the main contribution of this paper concerns frequency variations. The framework consists of definitions of power quality measures, a set of criteria for the power quality and a technique for modelling the system. In addition to this, when possible, measurements are made to calibrate the model or verify the predicted behaviour of the system. The definitions are based on statistical measures for the frequency of occurrence of instantaneous and mean values. The paper will outline criteria in a qualitative way. The modelling technique referred to in the paper is the one used in the JODYMOD Dynamic Wind Diesel Simulation Package, developed by European team with support from the JOULE I programme. The paper includes a case study, in which the fram work is applied on the simple and robust experimental wind diesel system at Risoe National Laboratory. (au)

A user-friendly software package to help engineers design wind diesel systems has been developed over the last three years with support from the CED's JOULE programme. Such systems have an important role to play in the supply of electricity to rural, grid remote sites. The modelling and software development was undertaken cooperatively by several EEC and EFTA countries. Both logistic and dynamic aspects of system operation are included in the final package which has been written for implementation on a PC running under MSDOS. This paper describes the modelling capabilities and validation of these engineering tools. (au)

15366 (DOE/CE/15604--T2) **Coal air turbine "CAT" program: Invention 604. Second quarterly report, January 1995--March 1995.** Foster-Pegg, R.W. Foster-Pegg (Richard W.), West Chester, PA (United States). 28 Apr 1995. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-94CE15604. Order Number DE95010373. Source: OSTI; NTIS; GPO Dep.

The primary objective of this 'CAT' project is to complete a conceptual design of this unique new combination of existing technology with cost estimates to show that the CAT system offers the economic incentive with low technical risk for a plant to be built which will demonstrate its viability. The technologies involved in the components of a CAT plant are proven, and the integration of the components into a complete plant is the only new developmental activity involved. Industry and the Federal General Services Administration (GSA), require the demonstration of a commercial plant before the viability of a new concept is accepted. To satisfy this requirement the construction of a plant of commercially viable size in excess of 15 MW if cogeneration and above 30 MW if all power, is proposed. This plant will produce economical power and heat for the owner. The plant will operate for a full commercial life and continue as an operating demonstration of the viability of the technology, gathering long term life and maintenance data, all adding to the credibility of the concept.

15367 (DOE/MC/10637--3292) **Project Calcium.** Hurley, J.P.; Benson, S.A.; Erickson, T.A.; Allan, S.E.; Bieber, J. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. Sep 1992. 113p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC21-86MC10637. Order Number DE95000069. Source: OSTI; NTIS; GPO Dep.

Fouling problems in utility boilers have been classified into two principal types: high-temperature and low-temperature fouling. A multiclient-sponsored program was initiated at the Energy and Environmental Research Center (EERC) to better understand the causes of low-temperature fouling when burning high-calcium western US coals. The goals of Project Calcium were to define the low-temperature deposition problem, identify the calcium-based components that are responsible for the formation of the deposits, develop ways to predict their formation, and identify possible methods to mitigate the formation of these deposits. To achieve the goals of Project Calcium, detailed sampling of utility boilers and laboratory-scale studies coupled with state-of-the-art methods to determine the inorganic components in coals and coal ash-derived materials were conducted. Boiler Sampling was also performed. The work involved sampling coal, entrained ash, deposits and slags from five full-scale utility boilers combined with detailed advanced characterization of the materials. The results of this work aided in identifying the key phenomena to focus the laboratory studies and in model verification. Field testing was conducted at three utilities.

15368 (DOE/MC/29257--95/C0410) **Rugged ATS turbines for alternate fuels.** Wenglarz, R.A.; Nirmalan, N.V.; Daehler, T.G. Allison Engine Co., Indianapolis, IN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC29257. (CONF-950629--1: ASME international gas turbine and aeroengine congress and exposition: land, sea and air, Houston, TX (United States), 5-8 Jun 1995). Order Number DE95005954. Source: OSTI; NTIS; GPO Dep.

A major national effort is directed to developing advanced turbine systems designed for major improvements in efficiency and emissions performance using natural gas fuels. These turbine designs are also to be adaptable for future operation with alternate coal and biomass derived fuels. For several potential alternate fuel applications, available hot gas cleanup technologies will not likely be adequate to protect the turbine flowpath from deposition and corrosion. Past tests have indicated that cooling turbine airfoil surfaces could ruggedized a high temperature turbine flowpath to alleviate deposition and corrosion. Using this specification. ATS turbine that was evaluated. The initial analyses also showed that two-phase cooling offers the most attractive method of those explored to protect a coal-fueled ATS turbine from deposition and corrosion. This paper describes ruggedization approaches, particularly to counter the extreme deposition and corrosion effects of the high inlet temperatures of ATS turbines using alternate fuels.

15369 (DOE/MC/30246--3973) **Advanced turbine systems program conceptual design and product development. Annual report, August 1993--July 1994.** Solar Turbines, Inc., San Diego, CA (United States). Nov 1994. 78p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30246. Order Number DE95000057. Source: OSTI; NTIS; GPO Dep.

This Yearly Technical Progress Report covers the period August 3, 1993 through July 31, 1994 for Phase 2 of the Advanced Turbine Systems (ATS) Program by Solar Turbines Incorporated under DOE Contract No. DE-AC421-93MC30246. As allowed by the Contract (Part 3, Section J, Attachment B) this report is also intended to fulfill the requirements for a fourth quarterly report. The objective of Phase 2 of the ATS Program is to provide the conceptual design and product development plan for an ultra-high efficiency, environmentally superior and cost-competitive industrial gas turbine system to be commercialized in the year 2000. During the period covered by this report, Solar has completed three of eight program tasks and has submitted topical reports. These three tasks included a Project Plan submission of information required by NEPA, and the selection of a Gas-Fueled Advanced Turbine System (GFATS). In the latest of the three tasks, Solar's Engineering team identified an

intercooled and recuperated (ICR) gas turbine as the eventual outcome of DOE's ATS program coupled with Solar's internal New Product Introduction (NPI) program. This machine, designated "ATS50" will operate at a thermal efficiency (turbine shaft power/fuel LHV) of 50 percent, will emit less than 10 parts per million of NOx and will reduce the cost of electricity by 10 percent. It will also demonstrate levels of reliability, availability, maintainability, and durability (RAMD) equal to or better than those of today's gas turbine systems. Current activity is concentrated in three of the remaining five tasks a Market Study, GFATS System Definition and Analysis, and the Design and Test of Critical Components.

15370 (DOE/MC/30247–3999) **Advanced turbine systems program conceptual design and product development. Quarterly report, August–October 1994.** Westinghouse Electric Corp., Orlando, FL (United States). Power Generation Business Unit. Dec 1994. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC30247. Order Number DE95000064. Source: OSTI; NTIS; GPO Dep.

This is a quarterly report on the Westinghouse Electric Corporation Advanced Turbine Systems Program–conceptual design and product development. The topics of the report include the management plan, National Energy Policy Act, selection of natural gas-fired advanced turbine systems, selection of coal-fired advanced turbine systems, market study, systems definition and analysis, design and test of critical components, and plans for the next reporting period.

15371 (DOE/PC/91162–T12) **Development & testing of industrial scale, coal fired combustion system, Phase 3. Eleventh quarterly technical progress report, July 1, 1994–September 30, 1994.** Zauderer, B. Coal Tech Corp., Merion Station, PA (United States). 15 Nov 1994. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91162. Order Number DE95009357. Source: OSTI; NTIS; GPO Dep.

The primary objective of the present effort is to perform the final testing, at a 20Mmbtu/hr commercial scale, of an air cooled, slagging coal combustor for application to industrial steam boilers and power plants. The focus of the test effort is on combustor durability, automatic control of the combustor's operation, and optimal environmental control of emissions inside the combustor.

15372 (SVF–535) **Study of operating experiences from modern diesel engine based cogeneration plants at Oskarshamn and Linkoeping.** Oeberg, R. (Sydkraft Konsult, Malmoe (Sweden)); Dalerhult, F. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Feb 1995. 105p. (In Swedish). Project Vaermeforsk-E1-205. Order Number DE95766642. Source: OSTI; NTIS.

The conclusions that can be made from the data that have been aquisited during the project are: - It has not been possible to identify any differences in performance or availability between the two plants that are related to the different fuel types. This is also in accordance with what could be expected, as the engine type is basically designed for operation on heavy fuel oil. - The test that have been performed with LPG indicate that the NO_x emissions from the engine are reduced as compared to emissions with light fuel oil. - The availability on both plants has been in the range 85-93% during the first season of operation in spite of the commissioning related problems that occurred during this period. The availability can be expected to increase, which is indicated by the fact that the Oskarshamn plants has had an availability of 97% during the last operating season. - The operational- and maintenance costs are 0.07 SEK/kWh_{E1} in both plants. - Similar problems have occurred in both plants, i.e. dust contamination in the SCR-units, leakages in the cooling water system, the piston rods had to be replaced. - The 'commissioning related' problems described above, has influenced the evaluation of plant availability, operations- and maintenance costs etc. This has had some influence on the accuracy of the conclusions that can be made from the first operational seasons. It is however very likely that the following operational seasons will give lower operation- and maintenance costs and higher availability, for instance due to the fact that the operators will gain more experience with the plants. - In order to get statistically relevant and 'typical' data it is advisable to increase the study so that it also will cover one or two more operational seasons. Figs, tabs, and photos

15373 (SVF–536) **Superheater material test of the compound tubes in a 65 MW_{th} PYROFLOW CFB boiler.** Peltola, K. (Hans Ahlstrom Laboratory (Finland)). Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Feb 1995. 65p. (In English, Swedish). Project Vaermeforsk-M1-303. Order Number DE95766643. Source: OSTI; NTIS.

A one-year test on four seamless composite tubes was carried out in a 65 MW_{th} Ahlstrom PYROFLOW boiler. The composite tubes of SANDVIK FECRAL/HT8 were installed in the hot end of the final superheater (SH III). The clad metal FECRAL on the base metal 10CrMo910 has two different Si contents; FECRAL0 0.29 w-% and FECRAL1 1.04 w-%. These samples of the two similar kinds of composite tubes were installed for parallel tests. Besides, the reference test tubes 13CrMo44 and 10CrMo910 were welded into SH III. The boiler is a Circulating Fluidized Bed (CFB) boiler. The steam is used for electricity generation, and in the paper mill. During the test the main daily steam generation varied between 8 and 19 kg/s. The mean temperature of the steam was 470 degrees C and the mean pressure was 80 bar. The co-combustion of Refuse Derived Fuel (RDF) started in September 1993. The main fuels used in the boiler were peat and coal. Approximately 30 tons of RDF was co-combusted daily until June 1994. The total test time in hot flue gas conditions was 7900 hours. The RDF proportion of the thermal energy input into the boiler was 10%, (i.e. 15 w-% of wet fuels) on a monthly basis. The actual combustion time of one truck load was from 10 to 12 hours. Consequently, the estimated continuous test time in RDF combustion for the tubes was 2500 hours, i.e. 25 to 30% of the thermal energy input. According to the measurements the corrosion rate was not significantly increased by the RDF co-combustion. Also the fouling tendency of the boiler was quite normal. In the basis of the test, the FeCrAl compounds tubes are more resistant to hot corrosion than the reference tubes. Figs, tabs

15374 (DOE/PC/90361–T16) **Catalytic fabric filtration for simultaneous NO_x and particulate control. Final report.** Weber, G.F.; Dunham, G.E.; Laudal, D.L.; Ness, S.R.; Schelkoph, G.L. North Dakota Univ., Grand Forks, ND (United States). Energy and Environmental Research Center. Aug 1994. 414p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-90PC90361. Order Number DE95004259. Source: OSTI; NTIS; GPO Dep.

The overall objective of the project proposed was to evaluate the catalyst-coated fabric filter concept for effective control of NO_2 and particulate emissions simultaneously. General goals included demonstrating high removal efficiency of NO_x and particulate matter, acceptable bag and catalyst life, and that process economics show a significant cost savings in comparison to a commercial SCR process and conventional particulate control. Specific goals included the following: reduce NO_x emissions to 60 ppM or less; demonstrate particulate removal efficiency of >99.5%; demonstrate a bag/catalyst life of >1 year; Control ammonia slip to <25 ppM; show that catalytic fabric filtration can achieve a 50% cost savings over conventional fabric filtration and SCR control technology; determine compatibility with $S0_2$ removal systems; and show that the concept results in a nonhazardous waste product.

15375 (DOE/PC/92521–T214) **Production and use of activated char for combined SO_2/NO_x removal. [Quarterly] technical report, September 1–November 30, 1994.** Lizzio, A.A. (Illinois State Geological Survey (United States)); DeBarr, J.A.; Donnals, G.L.; Feizoulof, C.A.; Kruse, C.W.; Lytle, J.M.; Rood, M.J.; Gangwal, S.K.; Honea, F. Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). [1994]. 27p. Sponsored by USDOE, Washington, DC (United States);Illinois Clean Coal Inst., Carterville, IL (United States);Illinois Dept. of Energy and Natural Resources, Springfield, IL (United States). DOE Contract FC22-92PC92521. Order Number DE95008000. Source: OSTI; NTIS; GPO Dep.

Carbon adsorbents have been shown to remove sulfur oxides from flue gas, and also serve as a catalyst for reduction of nitrogen oxides at temperatures between 80 and 150°C. The overall objective of this project is to determine whether Illinois coal is a suitable feedstock for the production of activated char which could be used as a catalyst for combined SO_2/NO_x removal, and to evaluate the potential application of the products in flue gas cleanup. During this quarter, further analyses of SO_2 adsorption and TPD data revealed that SO_2 adsorption was directly proportional to the number of unoccuppied (free) adsorption sites on the carbon surface. The SO_2 capacity of a series of prepared IBC-102 chars and commercial activated carbons normalized with respect to the number of free sites varied by less than a factor of two, which indicated an excellent correlation. Based on these results, a mechanism for SO_2 adsorption on carbon and conversion to H_2SO_4 was proposed. To study NO_x reduction by activated char, a packed bed flow through system was designed and constructed. A quadrupole mass spectrometer was installed to monitor the [NO] and [NO_2]; NO breakthrough curves were obtained for a commercial activated carbon at various [NO].

15376 (NEI-NO–505) **Natural gas for power generation. Prospects and limitations.** McNair, L.K. (National Power PLC (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 7p. (CONF-9408229–12: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766581. Source: OSTI; NTIS; INIS.

The conference paper discusses prospects and limitations on natural gas power generation and supply in United Kingdom. Some aspects on power distribution to Europe are dealt with.

15377 (NEI-NO–506) **Norwegian gas supplies for the European market.** Hansen, B.L. (Norsk Hydro A/S (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 14p. (CONF-9408229–13: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766582. Source: OSTI; NTIS; INIS.

The conference paper deals with the Norwegian key role in the European gas market with increasing market shares. The supply capacity in a long-term perspective can be 65-70 bcm/year or more if export prices support the development of new and more costly gas resources. The main challenges for the Norwegian shelf are discussed. 5 figs.

15378 (AEC–95010510) **Civilian Power Program. Part 1, Summary, Current status of reactor concepts.** USAEC Division of Reactor Development, Washington, DC (United States). 1 Sep 1959. 263p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010510. Source: OSTI; NTIS; GPO Dep.

This study group covered the following: delineation of the specific objectives of the overall US AEC civilian power reactor program, technical objectives of each reactor concept, preparation of a chronological development program for each reactor concept, evaluation of the economic potential of each reactor type, a program to encourage the the development, and yardsticks for measuring the development. Results were used for policy review by AEC, program direction, authorization and appropriation requests, etc. This evaluation encompassed civilian power reactors rated at 25 MW(e) or larger and related experimental facilities and R&D. This Part I summarizes the significant results of the comprehensive effort to determine the current technical and economic status for each reactor concept; it is based on the 8 individual technical status reports (Part III).

15379 (IAEA-SM–317/33) **PC version of PRIS (Power Reactor Information System).** Fukala, J. (Nuclear Information Centre, Prague (Czech Republic)); Stanik, Z.; White, D. International Atomic Energy Agency, Vienna (Austria); Food and Agriculture Organization of the United Nations, Rome (Italy); United Nations Educational, Scientific and Cultural Organization (UNESCO), 75 - Paris (France); United Nations Industrial Development Organization, Vienna (Austria). May 1990. 8p. (CONF-900550–: International symposium on the future of scientific, technological and industrial information services, Leningrad (USSR), 28-31 May 1990). Order Number DE95628745. Source: OSTI; NTIS (US Sales Only); INIS.

The IAEA has been collecting operating experience data on nuclear power plants in the Member States since 1970. In 1980 a computerized database was established, the IAEA Power Reactor Information System (PRIS). To make PRIS data available to the Member States in a more convenient format, the development of a PC version of PRIS started in 1989.

15380 (INIS-JP–031) **Present status of nuclear power safety studies in JAERI, 1994.** Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment. Oct 1994. 114p. (In Japanese). Order Number DE95768238. Source: OSTI; NTIS; INIS.

Securing safety in the development and utilization of nuclear power is the prerequisite, and in order to maintain the safety of nuclear power facilities at level corresponding to the expansion and diversification of nuclear power development and utilization, it is necessary to promote the safety research. The reliable evaluation of environmental effect and the safe disposal of radioactive waste are the indispensable conditions. Japan Atomic Energy Research Institute has carried out the research on the engineering safety of nuclear reactors and nuclear fuel cycle facilities and the research on the environmental safety related to environmental radiation and the treatment and disposal of radioactive waste. In this book, the researches on the safety of reactor fuel, the reliability of reactor machinery and equipment and structures, the thermo-hydraulic behavior of reactors at the time of accidents, the behavior of reactors at the time of severe accidents, the analytical research on the safety of reactors, the researches on the safety of nuclear fuel cycle, the treatment and disposal of radioactive waste, the assessment and analysis of environmental radiation and radioactivity, and the individual researches related to nuclear power safety are reported. (K.I.).

15381 (NUREG–0020-Vol.19) **Licensed operating reactors. Status summary report data as of 12-31-94: Volume 19.** Nuclear Regulatory Commission, Washington, DC (United States). Office of Information Resources Management. Apr 1995. 343p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

The Nuclear Regulatory Commission's annual summary of licensed nuclear power reactor data is based primarily on the report of operating data submitted by licensees for each unit for the month of December because that report contains data for the month of December, the year to date (in this case calendar year 1994) and cumulative data, usually from the date of commercial operation. The data is not independently verified, but various computer checks are made. The report is divided into two sections. The first contains summary highlights and the second contains data on each individual unit in commercial operation. Section 1 capacity and availability factors are simple arithmetic averages. Section 2 items in the cumulative column are generally as reported by the licensee and notes as to the use of weighted averages and starting dates other than commercial operation are provided.

15382 (DOE/ER/75788–1) **Nonlinear stability models and analyses of the nuclear-coupled thermal-hydraulic behavior of boiling water reactors. Interim report, October 1, 1992–May 30, 1993.** Dorning, J.J. Virginia Univ., Charlottesville, VA (United States). Dept. of Mechanical, Aerospace and Nuclear Engineering. May 1993. 91p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-92ER75788. (UVA–527484/MANE93/101). Order Number DE95010153. Source: OSTI; NTIS; INIS; GPO Dep.

All the objectives originally scheduled for the first year of this grant have been achieved. Furthermore, the project is ahead of schedule, in that a substantial amount of work has been completed on two significant objectives originally planned for the second year. This interim report is divided into five parts, summarizing the mathematical development, analysis and results of the project goals – goals originally planned for the first year and completed, and those on which substantial progress has been made ahead of schedule. Effects of unheated riser sections and the downcomer recirculation loop on the stability characteristics of advanced boiling water reactor designs that incorporate risers or unheated channel extensions are summarized in Part A. Such extensions are incorporated above the heated reactor core channels to enhance buoyancy-driven natural thermal convection both during normal at-power operation and during emergency shutdown. The effects of both, the inclusion of unheated riser sections in the designs (one of the goals substantially completed ahead of schedule), and the inclusion of the recirculation loop in the models (first year goal) were generally found to be destabilizing. In general, as riser lengths were increased equilibria that previously were stable became unstable, and the systems with the taller risers evolved to density-wave limit cycle oscillations. As a building block of the second year goal – to extend the one dimensional dynamical analysis of reactor thermal-hydraulics/neutron-kinetics to two and three dimensions – we have carried out, ahead of schedule, the nonlinear dynamical analysis of two-phase flow in multiple parallel heated channels. Some basic aspects of bifurcation phenomena in two-phase flow and the related nonlinear dynamics of single and multiple parallel, uniformly and nonuniformly heated channels are studied.

15383 (LTKK-TJ–41, pp. 159-169) **Research of severe accidents in Finland.** Mattila, L. (VTT Energy, Espoo (Finland)). Lappeenranta Univ. of Technology (Finland). 1994. (CONF-9406330–: Seminar on French-Finnish colloquium on safety of French and Russian type nuclear power plants, Lappeenranta (Finland), 14-16 Jun 1994). In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

Research efforts aim to confirm and support the development and implementation of the severe accident management plans of the Finnish nuclear plants. At TVO (ABB Atom BWR) major issues to be confirmed are the failure mode of the reactor vessel and the cooling of the core debris in water filled cavity. At Loviisa (VVER-440 PWR), the plans include keeping the molten core materials within the reactor vessel by external flooding of the vessel and removing the long term decay heat from the containment by external spray of the containment steel shell. The scope of the Loviisa plant analyzer, implemented in the APROS simulation environment, is being extended to degraded core conditions with primarily training related aims. APROS modules are also being used in the development of computerized accident management support systems. (orig.) (6 refs., 34 figs.).

15384 (NUREG/CR–4667-Vol.18) **Environmentally assisted cracking in light water reactors. Semiannual report, October 1993–March 1994. Volume 18.** Chung, H.M. (Argonne National Lab., IL (United States)); Chopra, O.K.; Erck, R.A.; Kassner, T.F.; Michaud, W.F.; Ruther, W.E.; Sanecki, J.E.; Shack, W.J.; Soppet, W.K. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Argonne National Lab., IL (United States). Mar 1995. 51p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-31109-ENG-38. (ANL–95/2-Vol.18). Source: OSTI; NTIS; INIS; GPO.

This report summarizes work performed by Argonne National Laboratory (ANL) on fatigue and environmentally assisted cracking (EAC) in light water reactors (LWRs) during the six months from October 1993 to March 1994. EAC and fatigue of piping, pressure vessels, and core components in LWRs are important concerns in operating plants and as extended reactor lifetimes are envisaged. Topics that have been investigated include (a) fatigue of low-alloy steel used in piping, steam generators, and reactor pressure vessels, (b) EAC of wrought and cast austenitic stainless steels (SSs), and (c) radiation-induced segregation and irradiation-assisted stress corrosion cracking (IASCC) of Type 304 SS after accumulation of relatively high fluence. Fatigue tests have been conducted on A302-Gr B low-alloy steel to verify whether the current predictions of modest decreases of fatigue life in simulated pressurized water reactor water are valid for high-sulfur heats that show environmentally enhanced fatigue crack growth rates. Additional crack growth data were obtained on fracture-mechanics specimens of austenitic SSs to investigate threshold stress intensity factors for EAC in high-purity oxygenated water at 289°C. The data were compared with predictions based on crack growth correlations for wrought austenitic SS in oxygenated water developed at ANL and rates in air from Section XI of the ASME Code. Microchemical and microstructural changes in high- and commercial-purity Type 304 SS specimens from control-blade absorber tubes and a control-blade sheath from operating boiling water reactors were studied by Auger electron spectroscopy and scanning electron microscopy to determine whether trace impurity elements, which are not specified in the ASTM specifications, may contribute to IASCC of solution-annealed materials.

15385 (SAND–92-1231) **Assessment of ALWR passive safety system reliability. Phase 1: Methodology development and component failure quantification.** Hake, T.M. (Sandia National Labs., Albuquerque, NM (United States)); Heger, A.S. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 180p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010401. Source: OSTI; NTIS; INIS; GPO Dep.

Many advanced light water reactor (ALWR) concepts proposed for the next generation of nuclear power plants rely on passive systems to perform safety functions, rather than active systems as in current reactor designs. These passive systems depend to a great extent on physical processes such as natural circulation for their driving force, and not on active components, such as pumps. An NRC-sponsored study was begun at Sandia National Laboratories to develop and implement a methodology for evaluating ALWR passive system reliability in the context of probabilistic risk assessment (PRA). This report documents the first of three phases of this study, including methodology development, system-level qualitative analysis, and sequence-level component failure quantification. The methodology developed addresses both the component (e.g. valve) failure aspect of passive system failure, and uncertainties in system success criteria arising from uncertainties in the system's underlying physical processes. Traditional PRA methods, such as fault and event tree modeling, are applied to the component failure aspect. Thermal-hydraulic calculations are incorporated into a formal expert judgment process to address uncertainties in selected natural processes and success criteria. The first phase of the program has emphasized the component failure element of passive system reliability, rather than the natural process uncertainties. Although cursory evaluation of the natural processes has been performed as part of Phase 1, detailed assessment of these processes will take place during Phases 2 and 3 of the program.

15386 (SKB-TR–94-20) **Technology and costs for decommissioning of Swedish nuclear power plants.** Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Jun 1994. 89p. Order Number DE95626856. Source: OSTI; NTIS; INIS.

The decommissioning study for the Swedish nuclear power plants has been carried out during 1992 to 1994 and the work has been led by a steering group consisting of people from the nuclear utilities and SKB. The study has been focused on two reference

plants, Oskarshamn 3 and Ringhals 2. Oskarshamn 3 is a boiling water reactor (BWR) and Ringhals 2 is a pressurized water reactor (PWR). Subsequently, the result from these plants have been translated to the other Swedish plants. The study gives an account of the procedures, costs, waste quantities and occupational doses associated with decommissioning of the Swedish nuclear power plants. Dismantling is assumed to start immediately after removal of the spent fuel. No attempts at optimization, in terms of technology or costs, have been made. The nuclear power plant site is restored after decommissioning so that it can be released for use without restriction for other industrial activities. The study shows that a reactor can be dismantled in about five years, with an average labour force of about 150 persons. The maximum labour force required for Oskarshamn 3 has been estimated to about 300 persons. This peak load occurred the first years but is reduced to about 50 persons during the demolishing of the buildings. The cost of decommissioning Oskarshamn 3 has been estimated to be about MSEK 940 in January 1994 prices. The decommissioning of Ringhals 2 has been estimated to be MSEK 640. The costs for the other Swedish nuclear power plants lie in the range MSEK 590-960. 17 refs, 21 figs, 15 tabs.

15387 (STUK-B-YTO–125) **Operation of Finnish nuclear power plants. Quarterly report 2nd quarter, 1994.** Tossavainen, K. (ed.). Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Dec 1994. 27p. Order Number DE95626857. Source: OSTI; NTIS; INIS.

The report is published also in Finnish as report number STUK-B-YTO–122.

The four Finnish nuclear power plants were in power operation for the second quarter of 1994, with the exception of brief repair outages at Loviisa plant units, the annual maintenance outages of Olkiluoto units and a brief TVO II shutdown at Midsummer due to low electricity demand. The load factor average of the plant units was 85.0%. At Loviisa plant units, cracks were detected in a valve of a pipeline connecting to the primary circuit. Cracking in the same location at both plant units showed inspection programmes to be inadequate. The event was rated on the International Nuclear Event Scale (INES) at level 1. At TVO I, the neutron flux protection limit basic values of the reactor scram circuit which had been lowered for the duration of a test at the beginning of the annual maintenance outage, were not restored. The matter was found out during plant unit start-up when one scram system channel indicated initiation of protective action; the actual protective function did not occur, however, since it requires the activation of at least two channels. During another event at Olkiluoto, shutdown service water system reliability at both plant units was found to have been impaired by installation errors of the pressure difference limit switches of service water filters. Both events showed there are deficiencies in utility procedures and the events were rated as level 1 on the INES. Other exceptional events and observations in this quarter were level 0 on the INES scale. (5 figs., 4 tabs.).

15388 (UCRL-ID–119423) **Laboratory directed research and development on disposal of plutonium recovered from weapons. FY1994 final report.** Pitts, J.H.; Choi, J.S. Lawrence Livermore National Lab., CA (United States). 14 Nov 1994. 76p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010209. Source: OSTI; NTIS; INIS; GPO Dep.

This research project was conceived as a multi-year plan to study the use of mixed plutonium oxide-uranium oxide (MOX) fuel in existing nuclear reactors. Four areas of investigation were originally proposed: (1) study reactor physics including evaluation of control rod worth and power distribution during normal operation and transients; (2) evaluate accidents focusing upon the reduced control rod worth and reduced physical properties of PuO_2; (3) assess the safeguards required during fabrication and use of plutonium bearing fuel assemblies; and (4) study public acceptance issues associated with using material recovered from weapons to fuel a nuclear reactor. First year accomplishments are described. Appendices contain 2 reports entitled: development and validation of advanced computational capability for MOX fueled ALWR assembly designs; and long-term criticality safety concerns associated with weapons plutonium disposition.

15389 (FZR–76) **1% cold leg break experiment on PMK-2. Test results and computer code analysis.** Ezsoel, G. (Hungarian Academy of Sciences, Budapest (Hungary). Central Research Inst. for Physics); Guba, A.; Perneczky, L.; Prasser, H.M.; Schaefer, F. Forschungszentrum Rossendorf e.V. (FZR), Rossendorf bei Dresden (Germany). Mar 1995. 44p. Order Number DE95768491. Source: OSTI; NTIS (US Sales Only); INIS.

In the framework of the computer code assessment programme for the VVER-440 type Paks Nuclear Power Plant a 1% cold leg break experiment has been conducted on the PMK-2 integral type test facility. It was followed by calculations using RELAP 5Mod3.1 and ATHLET in order to assess code capabilities. This experiment was started from the nominal operational parameters and it was considered that only the high pressure injection system (HPIS) is available and there is no injection from the safety injection tanks (SIT). This experiment was the repetition of the test measured in 1990, with improved data aquisition system. The first part of this report includes a short description of the facility, the measurement description, the test results including the local void measurement and a short interpretation of the main phenomena. In the second part of the report the analysis performed by the RELAP 5Mod3.1 and ATHLET Mod1.1 Cycle A codes are given. (orig.)

15390 (IVO-A–07/94) **The loadings and strength of nuclear power plant structures in core damage accidents.** Varpasuo, P. (Ivo International Oy, Vantaa (Finland)). Imatran Voima Oy, Vantaa (Finland). 1994. 116p. (In Finnish). Order Number DE95628753. Source: OSTI; NTIS; INIS.

The reactor cavity of VVER-91 NPP is a thick-walled, cylindrical reinforced concrete structure. In case of molten core-water reaction during the severe reactor accident the load carrying capacity of the cavity structure is of interest against the short impulse type loading caused by the steam explosion phenomenon. The assumed size of the impulse was 20 kPa-s and the duration was 10 ms. This investigation was divided in several phases. First, the elastic response of the cavity was determined using the ABAQUS code. Next, the static response of the cavity was evaluated using elasto-plastic properties of reinforcement and concrete and also taking into account the cracking of the concrete. This analysis was done with the aid of ABAQUS/STANDARD and ANSYS codes and the obtained results agreed reasonably with each other. In order to obtain a qualitative picture of the behaviour of the structure under the impulse load a simplified single degree of freedom model was developed. The hoop reinforcement of the cavity was taken as an elasto-plastic spring and the wall concrete acted as a mass. Using this model the suitable amount of hoop reinforcement was determined. In next phase, the dynamic analysis of the structure was attempted using elasto-plastic material properties and concrete cracking. (13 refs., 57 figs.).

15391 (KAPL–4798) **Residual stresses and stress corrosion cracking in pipe fittings.** Parrington, R.J.; Scott, J.J.; Torres, F. Knolls Atomic Power Lab., Schenectady, NY (United States). Jun 1994. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC12-76SN00052. (CONF-9409321–1: Fontevraud 3, Chinon (France), 12-16 Sep 1994). Order Number DE95009332. Source: OSTI; NTIS; INIS; GPO Dep.

Residual stresses can play a key role in the SCC performance of susceptible materials in PWR primary water applications. Residual stresses are stresses stored within the metal that develop during deformation and persist in the absence of external forces or temperature gradients. Sources of residual stresses in pipe fittings include fabrication processes, installation and welding. There are a number of methods to characterize the magnitude and orientation of residual stresses. These include numerical analysis, chemical cracking tests, and measurement (e.g., X-ray diffraction, neutron diffraction, strain gage/hole drilling, strain gage/trepanning, strain gage/section and layer removal, and acoustics). This paper

presents 400 C steam SCC test results demonstrating that residual stresses in as-fabricated Alloy 600 pipe fittings are sufficient to induce SCC. Residual stresses present in as-fabricated pipe fittings are characterized by chemical cracking tests (stainless steel fittings tested in boiling magnesium chloride solution) and by the sectioning and layer removal (SLR) technique.

15392 (LTKK-TJ–41, pp. 1-17) **VVER and RBMK reactors.** Valtonen, K. (Finnish Centre for Radiation and Nuclear Safety, Helsinki (Finland)). Lappeenranta Univ. of Technology (Finland). 1994. (CONF-9406330–: Seminar on French-Finnish colloquium on safety of French and Russian type nuclear power plants, Lappeenranta (Finland), 14-16 Jun 1994). In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

The safety of VVER and RBMK reactors has been discussed a lot after Chernobyl accident. Some improvements have been performed since that especially in RBMK-reactors and extensive programmes for backfitting have been planned and are partly underway. There are two different sizes of VVER reactors, 440 MW and 1000 MW. The design bases and designs itself vary inside the family of two size classes depending on the age of the plant. The oldest VVER-440 is called model 230 and the newest model 213. The oldest VVER-1000 units (two units) are prototypes that have some unique, nonfavorable features. The next stage of VVER-1000 developement (three units) is model V-302 and the remaining 15 plants in operation are model V-320, but even within this latest model there are some differences. The design bases and designs vary also inside the family of the RBMK reactors exactly the same way as in VVERs. The most important design bases of nuclear power plants designed in the former Soviet Union is presented in this paper. Also some safety advantages and disadvantages of these NPPs are discussed. (au). (5 figs.).

15393 (LTKK-TJ–41, pp. 18-40) **Industrial safety studies for VVERs in FRAMATOME.** Gandrille, J.L. (Framatome, Paris (France)). Lappeenranta Univ. of Technology (Finland). 1994. (CONF-9406330–: Seminar on French-Finnish colloquium on safety of French and Russian type nuclear power plants, Lappeenranta (Finland), 14-16 Jun 1994). In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

Since more than ten years, FRAMATOME has been involved in VVER activities, initiated by a comparison of Western and VVER plants, in the frame of a commercial proposal to Finnish customers in the early 80s. FRAMATOME is funding together with EDF and IPSN the development of the advanced thermalhydraulic code CATHARE. Currently available versions of CATHARE allow to perform best estimate calculations of LOCA accidents, small and large breaks, and non LOCA transients such as steam generator feedwater or steam line breaks, partial or total feedwater loss, steam generator tube ruptures, and other transients. CATHARE is used at FRAMATOME for all these transients in the frame of advanced methodologies for safety analysis, or for reference calculations. (au). (20 figs., 2 tabs.).

15394 (LTKK-TJ–41, pp. 88-96) **PACTEL - facility for VVER thermal hydraulics.** Kouhia, J. (VTT Energy, Espoo (Finland)). Lappeenranta Univ. of Technology (Finland). 1994. (CONF-9406330–: Seminar on French-Finnish colloquium on safety of French and Russian type nuclear power plants, Lappeenranta (Finland), 14-16 Jun 1994). In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

The PArallel Channel TEst Loop (PACTEL) is a medium scale integral test facility (full height, volumetrically scaled, 1:305) designed to simulate thermal hydraulic phenomena characteristic of the VVER reactors with particular attention to the versions used in Finland. The PACTEL facility is located in Lappeenranta and it has been in operation since 1990. The facility was constructed by VTT Energy and Lappeenranta University of Technology. In the paper a short description of the PACTEL facility is given, as well as new steam generator model, which will replace the original PACTEL steam generator models. A measurement instrumentation is presented briefly. As an example of the investigations made so far, some findings of two test series to study the behaviour natural circulation over a range of primary side inventories are shown. (4 refs., 6 figs., 1 tab.).

15395 (LTKK-TJ–41, pp. 97-115) **High burn-up fuel and reactivity accident.** Latche, J.C. (Inst. de Protection et de Surete Nucleaire (France)). Lappeenranta Univ. of Technology (Finland). 1994. (CONF-9406330–: Seminar on French-Finnish colloquium on safety of French and Russian type nuclear power plants, Lappeenranta (Finland), 14-16 Jun 1994). In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

A research program regarding the consequences of a Reactivity Initiated Accident occurring in PWRs is at present time carried out at the Nuclear Protection and Safety Institute (IPSN). It is specially devoted to the study of the behaviour of highly irradiated fuel during fast power transients such as control rod ejections. The study progresses in two fronts: (1) an experimental program will be performed in the CABRI facility, (2) a computer code, namely SCANAIR, is being developed. After validation on the available tests, this code must allow a reliable extrapolation to the reactor case. Both SCANAIR code and CABRI program and first results are presented.

15396 (LTKK-TJ–41, pp. 116-158) **Overview of severe accident research at the Nuclear Protection and Safety Institute of CEA.** Porracchia, A. (Inst. de Protection et de Surete Nucleaire (France)). Lappeenranta Univ. of Technology (Finland). 1994. In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

After the Three Mile Island and Chernobyl accidents, the possibility that an accident exceeds the design basis accident, commonly adopted, had to be addressed by severe accident reasearch programmes. Therefore, the understanding of phenomena occurring during Light Water Reactor severe accidents has become an important task in the nuclear safety research. In numerous countries, both experimental and analytical studies have been conducted in order to try to model these phenomena with a sufficient level of confidence. At the Nuclear Protection and Safety Institute (IPSN) of the French Commissariat a l'Energie Atomique (CEA), experiments along with code developments are being performed since the beginning of the eighties. As far as computer codes are concerned, IPSN has followed the general two-tier approach pursued worldwide for severe accident code development, i.e. integral codes and detailed mechanistic codes. At IPSN, the ESCADRE system is being developed as an integral code for the calculation of whole accidental sequences. The code can be used starting from the core uncovery up to the fission product release outside the plant containment. The beginning of the accidental sequence has to be calculated by a thermalhydraulic code (CATHARE is used in IPSN). In parallel to this development, IPSN is preparing the ICARE code as a detailed mechanistic code for studying the in-vessel core degradation up to the lower head failure. (43 figs.).

15397 (LTKK-TJ–41, pp. 170-197) **Review of main activities concerning computer codes used for VVER thermal-hydraulic safety analyses in OKB Gidropress.** Volkov, B. (OKB Gidropress, Podolsk (Russian Federation)). Lappeenranta Univ. of Technology (Finland). 1994. (CONF-9406330–: Seminar on French-Finnish colloquium on safety of French and Russian type nuclear power plants, Lappeenranta (Finland), 14-16 Jun 1994). In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

The most important features of activities concerning DINAMIKA, TETCH and other computer codes used for VVER thermal-hydraulic safety analyses in OKB Gidropress are reviewed. The problems of validation of these codes for VVER NPP transients and accident evaluation are considered. (au) (6 refs., 27 figs.).

15398 (LTKK-TJ–41, pp. 198-242) **APROS computer code, new developments.** Haenninen, M. (VTT Energy, Espoo (Finland)). Lappeenranta Univ. of Technology (Finland). 1994.

(CONF-9406330–: Seminar on French-Finnish colloquium on safety of French and Russian type nuclear power plants, Lappeenranta (Finland), 14-16 Jun 1994). In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

The advanced PROcess Simulation environment (APROS) has been developed by Imatran Voima Oy and Technical Research Centre of Finland since 1986. It provides physical models, solution algorithms and process components to be used in different simulation systems for design, analysis and training purposes. The APROS simulation model library contains several physical models, of which a user may choose proper models depending on the application. The possibility to use process components and the graphical user interface makes the use of APROS efficient and easy. The process component, the user interface and physical simulation models are briefly described in the paper. The validation of the present models are discussed and the nuclear applications are presented. (51 figs.).

15399 (LTKK-TJ–41, pp. 243-250) **HEXTRAN - a 3-D reactor dynamics code for VVER accident analysis.** Kyrki-Rajamaeki, R. (VTT Energy, Espoo (Finland)). Lappeenranta Univ. of Technology (Finland). 1994. (CONF-9406330–: Seminar on French-Finnish colloquium on safety of French and Russian type nuclear power plants, Lappeenranta (Finland), 14-16 Jun 1994). In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

The reactor dynamics calculation system of VTT Energy consists of models for both reactor types in Finland - the ABB Atom type BWRs in Olkiluoto and the VVER type PWRs in Loviisa. HEXTRAN is a three-dimensional hexagonal transient and accident analysis code developed in VTT for VVERs. Now it is possible to make fully realistic accident analyses starting from accurate core conditions. The thermal hydraulics model SMABRE is dynamically coupled with HEXTRAN for the primary and secondary circuit calculations. HEXTRAN coupled with SMABRE has been extensively applied to safety analyses of the Loviisa power station, of the new Russian VVER-91 concept, and of the Hungarian VVER-440 type NPP Paks. Main applications are the calculations of asymmetric accidents in the reactor core originating from neutronic or thermal hydraulic disturbances in core or cooling circuits. The main properties of HEXTRAN, its applications and plans for the development of its hydraulics model are presented in the paper. (14 refs., 2 figs.).

15400 (LTKK-TJ–41, pp. 251-258) **An overview the boron dilution issue in PWRs.** Hyvaerinen, J. (Finnish Centre for Radiation and Nuclear Safety, Helsinki (Finland)). Lappeenranta Univ. of Technology (Finland). 1994. (CONF-9406330–: Seminar on French-Finnish colloquium on safety of French and Russian type nuclear power plants, Lappeenranta (Finland), 14-16 Jun 1994). In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

The presentation is an overview of boron (boric acid) dilution in pressurized water reactors (PWRs). Boric acid has been widely used in PWRs as a dissolved poison, as one of the main reactivity controlling means, for a long time, from nearly but not quite from the beginning of the design, construction and operation of PWRs in the present-day sense. The specific safety issue, namely the risk of uncontrolled reactivity insertion due to inadvertent boron dilution, is discussed first, followed by a brief look on the history of boron usage in PWRs. A discussion of boron dilution phenomenology is presented next in general terms. Some particular concerns that boron dilution phenomena arouse in the minds of a regulator will also be presented before concluding with a brief look on the future of dissolved poisons. (11 refs.).

15401 (LTKK-TJ–41, pp. 259-264) **Boron mixing transients in a 900 MW PWR vessel for a reactor start-up operation.** Alvarez, D. (EDF/DER (France). National Hydraulics Lab.); Martin, A.; Schneider, J.P. Lappeenranta Univ. of Technology (Finland). 1994. (CONF-9406330–: Seminar on French-Finnish colloquium on safety of French and Russian type nuclear power plants, Lappeenranta (Finland), 14-16 Jun 1994). In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

In 1991 a R and D action, based on numerical simulations and experiments on PWRs' primary coolant temperature or boron mixing capabilities, was initiated. The paper presents the test facility BORA-BORA (a 1/5th scaled mock-up of a 900MW PWR vessel) and the Thermalhydraulic Finite Element Code N3S used for 3D calculations performed on the accurate geometry of the plant. As a validation test case of these experimental and numerical tools, the results obtained on the primary coolant mixing capabilities in the vessel with the three loops balanced in mass flow rate are presented. The second part of the report deals with the mixing of a clear water plug in the vessel when a primary coolant pump start-up. The results are obtained in the mock-up in terms of boron concentration at the core inlet for several clear water plug volumes. The numerical results give the complete fluid flow and boron concentration pattern but comparisons were made at the core inlet. (orig.)(11 refs., 9 figs.).

15402 (LTKK-TJ–41, pp. 265-275) **Problem of boric acid dilution in IVO.** Savolainen, S. (Imatran Voima Oy, Loviisa (Finland)). Lappeenranta Univ. of Technology (Finland). 1994. (CONF-9406330–: Seminar on French-Finnish colloquium on safety of French and Russian type nuclear power plants, Lappeenranta (Finland), 14-16 Jun 1994). In *French-Finnish colloquium on safety of French and Russian type nuclear power plants.* 286p. Order Number DE95628752. Source: OSTI; NTIS; INIS.

Boron dilution analysis has recently become one of the most interesting topics concerning to PWR safety. Dilution analyses have been mainly dealing with so called external dilution mechanisms and its reactor dynamic consequences. In the beginning of 1993 the Finnish Centre for Radiation and Nuclear Safety required Imatran Voima Oy to carry out additional studies concerning other possible boron dilution mechanisms, consequences and their mitigation. The present study mainly deals with inherent dilution processes during accident and transient conditions. In the first part of the project the studies are based mainly on deterministic study of physical phenomenon leading to inherent boron dilution. Analyses are continued with mixing analyses and finally reactor-dynamic consequences are determined based on analyzed thermal-hydraulic preconditions. Furthermore the preventative operational actions will be studied. The results will be included in the PSA study for Loviisa Power Plant. The object of the paper is to discuss the inherent boron dilution studies for Loviisa Power Plant. (orig.) (5 refs.).

15403 (NUREG–1517) **Report of the South Texas Project Allegations Review Team. Docket Nos. 50-498 and 50-499, Houston Lighting and Power Company et al.** Kokajko, L. (Nuclear Regulatory Commission, Washington, DC (United States)); Skay, D.; Wang, H.; Murphy, D. Nuclear Regulatory Commission, Washington, DC (United States). Office of Nuclear Reactor Regulation. Mar 1995. 218p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

This report provides the results of the South Texas Project Allegations Review Team of the US Nuclear Regulatory Commission. This team was formed to obtain and review allegations from individuals represented by three attorneys who had contacted Congressional staff members. The allegers were employed in various capacities at South Texas Project Electric Generating Station, licensed by Houston Lighting and Power Company, et al.; therefore, the allegations are confined to this site. The South Texas Project Allegations Review Team reviewed, referred, and dispositioned concerns related to discriminatory issues (harassment and intimidation), falsification of records and omission of information, and various technical issues. The team was able to substantiate certain technical issues of minor safety significance or regulatory concern at the South Texas Project facility, but it did not find widespread discriminatory practices such as harassment and intimidation.

15404 (NUREG/CR–5591-Vol.4-No.2) **Heavy-section steel irradiation program. Volume 4, No. 2. Semiannual progress report, April 1993–September 1993.** Corwin, W.R. 1995. 46p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL/TM–11568/V4-N2). Source: OSTI; NTIS; GPO; INIS.

Maintaining the integrity of the reactor pressure vessel (RPV) in a light-water-cooled nuclear power plant is crucial in preventing and controlling severe accidents which have the potential for major contamination release. The RPV is the only key safety-related component of the plant for which a duplicate or redundant backup system does not exist. In particular, it is vital to fully understand the degree of irradiation-induced degradation of the RPV's fracture resistance which occurs during service, since without that radiation damage, it is virtually impossible to postulate a realistic scenario that would result in RPV failure. For this reason, the Heavy-Section Steel Irradiation (HSSI) Program has been established to provide a quantitative assessment of the effects of neutron irradiation on the material behavior and, in particular, the fracture toughness properties of typical pressure-vessel steels. Effects of specimen size; material chemistry; product form and microstructure; irradiation fluence, flux, temperature, and spectrum; and postirradiation annealing are being examined on a wide range of fracture properties. The HSSI Program is arranged into 14 tasks: (1) program management, (2) fracture toughness (K_{Ic}) curve shift in high-copper welds, (3) crack-arrest toughness (K_{Ia}) curve shift in high-copper welds, (4) irradiation effects on cladding, (5) K_{Ic} and K_{Ia} curve shifts in low upper-shelf (LUS) welds, (6) annealing effects in LUS welds, (7) irradiation effects in a commercial LUS weld, (8) microstructural analysis of irradiation effects, (9) in-service aged material evaluations, (10) correlation monitor materials, (11) special technical assistance, (12) Japan Power Development Reactor steel examination, (13) technical assistance for Joint Coordinating Committee on Civilian Nuclear Reactor Safety (JCCCNRS) Working Groups 3 and 12, and (14) additional requirements for materials.

15405 (NUREG/CR–6260) **Application of NUREG/CR-5999 interim fatigue curves to selected nuclear power plant components.** Ware, A.G. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Morton, D.K.; Nitzel, M.E. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering; Idaho National Engineering Lab., Idaho Falls, ID (United States); Lockheed Idaho Technologies Co., Idaho Falls, ID (United States). Mar 1995. 190p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC07-94ID13223. (INEL–95/0045). Source: OSTI; NTIS; INIS; GPO.

Recent test data indicate that the effects of the light water reactor (LWR) environment could significantly reduce the fatigue resistance of materials used in the reactor coolant pressure boundary components of operating nuclear power plants. Argonne National Laboratory has developed interim fatigue curves based on test data simulating LWR conditions, and published them in NUREG/CR-5999. In order to assess the significance of these interim fatigue curves, fatigue evaluations of a sample of the components in the reactor coolant pressure boundary of LWRs were performed. The sample consists of components from facilities designed by each of the four U.S. nuclear steam supply system vendors. For each facility, six locations were studied, including two locations on the reactor pressure vessel. In addition, there are older vintage plants where components of the reactor coolant pressure boundary were designed to codes that did not require an explicit fatigue analysis of the components. In order to assess the fatigue resistance of the older vintage plants, an evaluation was also conducted on selected components of three of these plants. This report discusses the insights gained from the application of the interim fatigue curves to components of seven operating nuclear power plants.

15406 (NUREG/CR–6266) **Analysis of boron dilution in a four-loop PWR.** Sun, J.G. (Argonne National Lab., IL (United States)); Sha, W.T. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Safety Programs; Argonne National Lab., IL (United States). Mar 1995. 69p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract W-31109-ENG-38. (ANL–94/35). Source: OSTI; NTIS; GPO; INIS.

Thermal mixing and boron dilution in a pressurized water reactor were analyzed with COMMIX codes. The reactor system was the four-loop Zion reactor. Two boron dilution scenarios were analyzed. In the first scenario, the plant is in cold shutdown and the reactor coolant system has just been filled after maintenance on the steam generators. To flush the air out of the steam generator tubes, a reactor coolant pump (RCP) is started, with the water in the pump suction line devoid of boron and at the same temperature as the coolant in the system. In the second scenario, the plant is at hot standby and the reactor coolant system has been heated to operating temperature after a long outage. It is assumed that an RCP is started, with the pump suction line filled with cold unborated water, forcing a slug of diluted coolant down the downcomer and subsequently through the reactor core. The subsequent transient thermal mixing and boron dilution that would occur in the reactor system is simulated for these two scenarios. The reactivity insertion rate and the total reactivity are evaluated and a sensitivity study is performed to assess the accuracy of the numerical modeling of the geometry of the reactor coolant system.

15407 (SAND–94-1515/1, pp. 2.3-2.7) **EPRI R&D programs in reactor pressure vessels.** Carter, R. (Electric Power Research Institute, Palo Alto, CA (United States)). Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was on overview of EPRI's programs on thermal annealing. Goals, key elements, and benefits were discussed.

15408 (SAND–94-1515/1, pp. 2.8-2.11) **EPRI R&D programs in reactor pressure vessels: Workshop overview.** Rosinski, S. (Sandia National Labs., Albuquerque, NM (United States)). Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was an overview of the thermal annealing workshop. Keys to a successful annealing program were discussed.

15409 (SAND–94-1515/1, pp. 3.29-3.58) **RPV integrity issues and regulatory requirements.** Gamble, R. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was an overview of integrity issues and regulatory requirements. Operational issues were reviewed (LTOP, PTS), as were material issues (upper shelf toughness) and radiation effects. These issues and effects were then linked to present percent regulatory requirements.

15410 (SAND–94-1515/1, pp. 3.3-3.27) **Reactor vessel embrittlement/thermal annealing.** Server, W.L. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a survey of embrittlement causes, actual measurements, and efforts to predict embrittlement. The effects of thermal annealing were also reviewed, as was previous history of the process.

15411 (SAND–94-1515/1, pp. 4.15-4.29) **Economic analysis of reactor vessel thermal annealing.** Griesbach, T.J. Sandia National Labs., Albuquerque, NM (United States). Sep 1994.

(CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was an overview of the economics of RPV annealing. Cost factors were reviewed, the results of four case studies using VTESTER were presented. Benefits of annealing were listed.

15412 (SAND–94-1515/1, pp. 4.3-4.13) **Embrittlement management and who is likely to need annealing.** Carter, R.G. (Electric Power Research Institute, Palo Alto, CA (United States)). Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a review of a program designed to ensure the safe service life of the reactor vessel consistent with regulatory requirements, minimizing embrittlement. Annealings, as a viable option to reactor full service life, was briefly discussed.

15413 (SAND–94-1515/1, pp. 5.3-5.33) **The BR3 vessel anneal: Lessons and perspective.** Fabry, A. (SCK-CEN, Mol (Belgium)). Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a compilation of transparencies prepared for the RPV thermal annealing workshop. These transparencies described mechanical testing performed on the annealed BR-3 pressure vessel.

15414 (SAND–94-1515/1, pp. 5.35-5.72) **Programme, realization and results from the RPVs annealing of NPP J. Bohunice.** Brumovsky, M. (Nuclear Research Institute, Rez (Czech Republic)). Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

Pressure vessels of the NPP Jaslovske Bohunice belong to "first generation" quality of WWER-440 reactors of 230 type. They were manufactured from 15Kh2MFA (Cr-Mo-V) type of steel, their welding metals have high content of phosphorus and higher content of copper, but no nickel content. One of the most important requirements for their design was a possibility for transportability by train, thus high neutron fluences are reached in their beltline region. As these materials show high susceptibility to radiation damage, long time ago it was decided to prepare a programme for backfitting realization of their annealing. This programme was prepared in a close cooperation of NPP Bohunice, SKODA Nuclear Machinery and Nuclear Research Institute Rez, all in former Czechoslovakia. Main results from individual parts is presented - annealing of RPVs of both units in NPP J. Bohunice was realized in the beginning of 1993.

15415 (SAND–94-1515/1, pp. 5.73-5.82) **Russian annealing experience and application to U.S. plants.** Cole, N.; Rogov, M.; Morozov, S. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a brief discussion of Russian experiences on the annealing of VVER-440 reactor vessels, with an application of lessons learned to US plants. A plan for annealing of the 1st US plant was presented.

15416 (SAND–94-1515/1, pp. 5.83-5.108) **Investigation of templets cut out of operating reactor vessels before and after annealing.** Kryukov, A. (Kurchatov Institute (Russian Federation)); Platonov, P.; Rogov, M.; Shtrombach, I. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a description of mechanical testing performed on samples of VVER-440 reactor vessels, before and after annealing the test program was presented, as were the results. It was indicated that the before-annealing test results can be used to determine the degree of radiation embrittlement.

15417 (SAND–94-1515/1, pp. 6.3-6.27) **Dry annealing experience in the U.S.** Rishel, R. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a review of dry annealing experience in the US. A number of studies (EPRI, EG&G) were reviewed, and the systems development experiences of Westinghouse were discussed. Drawings and photographs were presented in the workshop. Future efforts were briefly discussed.

15418 (SAND–94-1515/1, pp. 7.3-7.26) **In-place nuclear reactor vessel annealing demonstration project.** Howell, D. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a discussion of the proposed annealing demonstration project at the canceled Marble Hill-1 reactor. The discussion, which was a compilation of transparencies on the noted subject, included overall objectives, scope of work, staging of equipment, and analytical objectives. Current status, including funding was summarized.

15419 (SAND–94-1515/1, pp. 8.13-8.33) **The US Nuclear Regulatory Commission's HSSI program annealing and reembrittlement studies at ORNL.** Iskander, S.K. (Oak Ridge National Lab., TN (United States)); Sokolov, M.A.; Nanstad, R.K.; Corwin, W.R. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. DOE Contract AC05-84OR21400. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was an overview of heavy section steel irradiation studies at ORNL. A review of current tasks was presented, as well as a review of both medium and long term studies to examine mechanical properties of irradiated, annealed, and re-irradiated samples results of research were presented.

15420 (SAND–94-1515/1, pp. 8.3-8.4) **ASTM/ASME activities.** Server, W. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a brief discussion of current ASTM/ASME activities on thermal annealing. Ongoing ASME Section XI activities and ASTM E10 task group activities were noted.

15421 (SAND–94-1515/1, pp. 8.35-8.49) **Overview of the UCSB program of fundamental studies on the post irradiation of reactor pressure vessel steels.** Odette, G.R. (Univ. of California, Santa Barbara, CA (United States)); Lucas, G.E.; Mader, E. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was an overview of annealing studies at the University of California at Santa Barbara. Objectives and strategy were discussed, as were current results and physical modeling.

15422 (SAND–94-1515/1, pp. 9.121-9.126) **Irradiation-anneal-reirradiation study of reactor pressure vessel materials.** Rosinski, S.T. (Sandia National Labs., Albuquerque, NM (United States)). Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was an overview of the status of the DOE sponsored irradiation annealing re-radiation program. A summary of materials tested was presented.

15423 (SAND–94-1515/1, pp. 9.3-9.31) **Actions/issues prior to annealing: Materials considerations.** Mager, T.R. (Westinghouse Electric Corp., Pittsburgh, PA (United States)); Freyer, P.D.; Burke, M.G. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was an overview of materials considerations prior to annealing micrographs of 80 welds were presented. Post-annealment response of reirradiated materials were discussed, and post-annealment surveillance recommendations were presented.

15424 (SAND–94-1515/1, pp. 9.33-9.72) **Structural analysis for reactor vessel thermal annealing.** Tunon-Sanjur, L. (Westinghouse Electric Corp., Pittsburgh, PA (United States)). Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a discussion of the structural analyses (thermal and stress) required for the annealing process. Results of 2D and 3D studies were presented, with the 3D studies applicable to both a 3-loop and 4-loop plant.

15425 (SAND–94-1515/1, pp. 9.73-9.88) **Mitigation of irradiation embrittlement by annealing.** Kryukov, A. (Kurchatov Institute (Russian Federation)); Platonov, P.; Sokolov, M. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a discussion of Russian philosophy and experiences with thermal annealing. The process described was felt applicable to US materials. Quantitative results were presented graphically.

15426 (SAND–94-1515/1, pp. 9.89-9.119) **1-Dimensional simulation of thermal annealing: Experiments to provide heat transfer boundary conditions and reactor pressure vessel response data to benchmark thermal/stress models.** Nakos, J. (Sandia National Labs., Albuquerque, NM (United States)); Rosinski, S.; Acton, R.; Strait, B.; Schulze, D. Sandia National Labs., Albuquerque, NM (United States). Sep 1994. DOE Contract AC04-76DP00789. (CONF-9402110–Vol.1: DOE/SNL/EPRI workshop on reactor pressure vessel thermal annealing, Albuquerque, NM (United States), 17-18 Feb 1994). In *Proceedings of the DOE/SNL/EPRI sponsored Reactor Pressure Vessel Thermal Annealing Workshop. Volume 1.* 513p. Order Number DE95002786. Source: OSTI; NTIS; INIS; GPO Dep.

The objective of this paper was a review of a proof-of-principle annealing process conducted on a RV section. Test conditions and set-up were described, and photographs of the test setup were presented. Results of various temperature measurements were also presented.

Proceedings of a technical committee meeting held in Beijing, China, 25-27 October 1993.** International Atomic Energy Agency, Vienna (Austria). Jan 1995. 125p. (CONF-9310429–: Technical committee meeting on response of fuel, fuel elements and gas cooled reactor cores under accidental air or water ingress conditions, Beijing (China), 25-27 Oct 1993). Order Number DE95628012. Source: OSTI; NTIS (US Sales Only); INIS.

The meeting was convened by the IAEA on the recommendation of the IAEA's International Working Group on Gas Cooled Reactors. It was attended by participants from China, France, Germany, Japan, Netherlands, Switzerland, the Russian Federation, the United Kingdom and the United States of America. The meeting covered the following topics: experimental investigations of the effects of air and water ingress; predicted response of fuel, graphite and other reactor components; options for minimizing or mitigating the effects of air or water ingress. 19 papers were presented at the meeting. A separate abstract was prepared for each of these papers. Refs, figs and tabs.

Accident sequence are considered for the gas-cooled High-Temperature Reactor (HTR), in which as a consequence of pipe rupture in the steam generator water may enter into the primary circuit and thus the reactor core. In two recent irradiation experiments in the High Flux Reactor Petten, the effect of water vapour injections on the release of fission gases has been investigated. In the test HFR-K6, data on the release from UO_2 are presented for burnups up to 9% FIMA. These results from water vapour injections yield information, heretofore lacking, on the influence under oxidation conditions on fission gas release in pebble bed reactors. In test HFR-B1, water vapour has been injected into fuel elements containing a definite number of UCO particles with exposed kernels dispersed in a fuel compact held in a graphite body. Intermittent water vapour injections were varied between 3 and 1050 Pa. The time profile of fission gas release consists of (i) an initial rapid release; (ii) a subsequent steady release; and (iii) a decline in release following termination of the water vapour injection. These three features correspond to the release of stored fission gas plus diffusional release, to diffusional release only and to the sintering and densification of the fuel in the absence of water vapour. The experiments indicate that the water vapour induced release may contribute significantly to the radiological impact. As a major task for the future evaluation, the relation between the release fraction and the water vapour partial pressure has to be established. (author). 7 refs, 3 figs, 6 tabs.

The compressive fracture test of the core support post, which locates below the core of the High Temperature Engineering Test Reactor (HTTR), was carried out using oxidized half-scale post specimens. Test specimens were oxidized in an air environment at three levels of oxidation temperatures. In this paper, the fracture load obtained from the test was found to be much greater than the design seismic load postulated in the HTTR. The fracture load ratio decrease due to oxidation was in a good agreement between the test and the analysis in which the stress concentration fracture was considered at the contact region of the support post and the seat. During the history of operation of six gas cooled reactors in France, some experience has been gained with accidental water ingress into the primary system. This occurred as a result of leaks in steam generators. This paper describes the cause of the leaks, and the resulting consequences. (author). 2 refs, 8 figs.

Accident sequences are considered for the gas-cooled High Temperature Reactor (HTR), in which water may enter into the primary circuit and reactor core as a consequence of pipe rupture in the steam generator. Irradiation experiments with intermittent water injections have demonstrated that moisture in the sweep gas lead to an increase of the release of fission gases and iodine from defective/failed particles. A special apparatus KORA was constructed in the Hot Cells of the Research Centre Juelich to study the effects of moisture-related fission product release as a function of temperature and water vapour partial pressure with different fuel samples. Initial experiments with irradiated UO_2 and UCO fuels at 800 deg. C showed an increased of ^{85}Kr release with water vapour additions. In contrast, intact particles are not affected even by extremely long water vapour injections. UO_2 kernels obtained by cracking particles from spherical fuel elements correspond to irradiation-induced failures; they show the following release fractions at 800 deg. C after repeated injections of water vapour: with a medium burn-up of 5% FIMA; with a high burn-up of 9% FIMA; release of 0.4 to 2.6% of the ^{85}Kr inventory; release of 17% of the ^{85}Kr inventory. In the case of defective UO_2 TRISO particles, which would dominate the release in an HTR-MODUL, some of the free fuel may have been carburized in the fabrication process during the final heat treatment at 1950 deg. C, which could lead to changed release behaviour. Further studies will have to show whether the release as a consequence of the influence of water vapour is similar to that from UO_2 kernels or possible higher. There was a complete moisture-induced release from high-burnup UCO kernels or designed-to-fail particles with a burnup of 20% FIMA. (Abstract Truncated)

15433 (IAEA-TECDOC–784, pp. 44-50) **Experimental investigations of reactivity effects caused by water ingress in a LEU-LHTR pebble-bed core.** Seiler, R. (Paul Scherrer Inst. A series of new critical experiments, in the framework of an IAEA Coordinated Research Programme on "Validation of Safety Related Reactor Physics Calculations for Low Enriched HTRs", is being carried out at the zero power facility, PROTEUS. The main aim of the experiments is the generation of safety related physics data to reduce the design and licensing uncertainties for small- and medium-sized, highly reflected, helium cooled reactors. The main parameters being investigated in the programme are critical masses, streaming effects, and changes in reactivity, neutron balance components and control rod effectiveness caused by water ingress into the reactor. Different deterministic pebble loading arrangements are being investigated in PROTEUS. This allows access to the core centre and the insertion of polyethylene rods for the simulation of water ingress. LEU fuel elements (German AVR type) of 16.7% ^{235}U enrichment and graphite elements, are being used to cover a range of moderator-to-fuel ratios. A first water ingress experiment was carried out with small amounts of plastic in HTR-PROTEUS Core 1 (an under-moderated close-packed hexagonal lattice with a carbon-to-uranium atom ratio of about 960). The reactivity increase in this case was small enough to be compensated by movement of the control rods. Good agreement was

obtained between measured and calculated values. Investigations in progress include a case with a much larger amount of plastic in this same type of core with criticality maintained by reduction of the core height. Experiments with plastic contents up to the amount corresponding to a maximal reactivity increase are planned in subsequent HTR-PROTEUS cores (a different core lattice arrangement is required to allow the introduction of the required amount of plastic in the form of rods). 19 refs, 4 figs, 2 tabs.

A program was initiated at BNL, in which a series of extensive full scale air ingress experiments were performed in 10 ft. long graphite channels in the temperature range from 300 deg. C - 800 deg. C. The experiments addressed the generic question of under what conditions "graphite burning" would or would not occur. Several hundred measurements were made, in which temperature-time-gas composition changes along the 10 ft channels were studied as functions of the air flow rates, air composition, channel geometry, graphite reactivity, Wigner energy etc. The conditions under which CO-O_2 explosions occurred were determined experimentally. In some cases the temperature-gas composition changes with position in the graphite channels were followed for several days before individual experiments were concluded. After concluding the "graphite burning" studies, BNL initiated an experimental program on the consequences of high temperature fuel failure in HTGRs for the Nuclear Regulatory Commission. Following the Chernobyl accident, the Nuclear Regulatory Commission requested that the members of the BNL staff who were involved in the Windscale accident analyses and the HTGR accident evaluation program re-evaluated the safety of all reactors in the USA that contained graphite. A safety evaluation was initiated and complete which addressed, in detail, the generic (design independent) conditions under which air ingress and Wigner energy releases could lead to self-sustained graphite fires in nuclear reactors. The two programs, produced comprehensive experimental and analytical investigations of the conditions under which air ingress and Wigner releases could lead to "graphite burning" in nuclear reactors. 13 refs.

KFA is setting up an experiment to study the ingress of air into the core, with the subsequent formation of an airflow driven by natural convection, for the hypothetical accident of a complete rupture of the coaxial hot gas duct. The experiment will have an active height for the natural convection of 7,50 m and a maximum temperature of 1,200 deg. C. The aim aims are to determine the onset time of the convection depending on various parameters, the mass flow and the locally dependent corrosion phenomena caused by the draft. By this means the theoretical models can be validated. The layout of the experiment as well as theoretical investigations to predict the expected performance are reported. (author). 3 refs, 15 figs.

The high temperature gas-cooled test reactor HTR-10 is a modular pebble bed core reactor. The spherical fuel elements are loaded and discharged continuously from the top to the bottom of the reactor pressure vessel(RPV) in operation. The rupture of a fuel handling tube is classified as one of the design basis accidents of HTR-10 reactor. After the accident of the rupture of a fuel handling tube, the RPV depressurizes speedily to the atmosphere in 3 minutes. Following the cooled helium of the reactor, air enters into the RPV and a natural convection will be built up. A numerical simulation of graphite oxidation is carried out by the OXIDE-RE code to analyze the consequences of the accident. The graphite oxidate reaction produces carbon monoxide and carbon dioxide. The concentration distributions of carbon monoxide and carbon dioxide and the graphite structure in the reactor are analyzed. Because of the relative lower temperature in the core throughout this accident, the amount of dioxide and oxygen production can meet the safety requirements. It is impossible to initiate denotation in HTR-10 reactor. (author). 5 refs, 13 figs, 1 tab.

The High Temperature Engineering Test Reactor (HTTR) is a graphite-moderated and helium gas-cooled reactor with prismatic fuel elements of hexagonal blocks. Each fuel element consists of graphite sleeves containing fuel compacts and a graphite block holding graphite sleeves. A support post is a cylindrical component and the most essential element to support the core. There are two kinds of accidents classified as an air ingress accident in the safety design of the HTTR; one is the rupture of the primary concentric

hot gas duct at the reactor pressure vessel (RPV) inlet nozzle, the other the rupture of a stand pipe attached to the top head closure of the RPV. The graphite structures will be oxidized during the air ingress accidents. It was found from this study that the air ingress accident of the guillotine rupture of the primary concentric hot gas duct was the severest from the graphite oxidation point of view and the oxidized graphite structures maintained the structural integrity after the accident. There is also no possibility of detonation induced by the produced carbon monoxide in the containment vessel. (author). 9 refs, 12 figs, 1 tab.

The ingress of larger amounts of water, steam or air into the primary circuit of a high temperature reactor is seen to be an accident of considerable safety relevance. The overall destructive potential of these effects depends strongly on the quantities of the invading material as well as on the physical and operational boundary conditions of the reactor system at the time of the ingress. The safety analysis of water and air ingress accidents therefore is based on scenarios depending on the plant's conditions and considering different levels of protection systems failures. With respect to a catastrophe-free nuclear technology scenarios in the hypothetical area without any protection system action are of special interest. Starting from the knowledge on design basis accident behaviour of the German modular HTR this paper discusses some scenarios in the hypothetic accident field that should be analyzed in detail to find the limitations of the inherent safety features of this type of reactor. For some cases preliminary answers on the basis of less sophisticated computer models are given and suggestions for further developments and improvements of the reactor design are formulated. (author). 13 refs, 12 figs.

15440 (IAEA-TECDOC–784, pp. 86-91) **Thermodynamic analysis of behaviour of HTGR fuel and fission products under accidental air or water ingress conditions.** Minato, K. A core of high temperature gas-cooled reactor (HTGR) consists of coated fuel particles, graphite and absorber of boron carbide (B_4C). Silicon carbide (SiC) as well as pyrolytic carbon (PyC) are used as coating materials for TRISO-coated fuel particles. Zirconium carbide (ZrC) is a candidate coating material which is expected to be used at higher temperatures than SiC. Thermodynamic analysis was carried out to understand the chemical behaviour of these materials and fission products under accidental air or water ingress conditions. The analysis on the systems of SiC-C-(O_2 or H_2O)-He, ZrC-C-(O_2 or H_2O)-He, and B_4C-C-(O_2 or H_2O)-He showed that the active-to-passive transitions of oxidation of SiC+C, ZrC+C and B_4C+C occurred at lower temperatures than those of SiC, ZrC and B_4C, respectively, at a given initial O_2 or H_2O pressure. Under most of the accident conditions the passive oxidation of these materials was expected to occur. In the passive oxidation of SiC+C, ZrC+C and B_4C+C preferential oxidation of SiC, ZrC and B_4C occurred, respectively, while C was not oxidized as long as SiC, ZrC and B_4C were present. B_4C was oxidized to B_2O_3 under the conditions of interest, where B_2O_3 was liquid with high vapor pressure of B-containing species. The analysis on the system of Cs-I-B_4C-C-(O_2 or H_2O)-He showed that cesium would form $CsBO_2$ if boron was available. Melting point of $CsBO_2$ is 989.7 K, which is higher than those of Cs and CsOH. This suggests that cesium should be deposited as $CsBO_2$ at higher temperature regions than as Cs or CsOH, which results in decrease in cesium release to the environment. (author). 25 refs, 8 figs.

15441 (IAEA-TECDOC–784, pp. 92-96) **Transient analysis of water ingress into the HTR-10 high temperature gas cooled test reactor.** Gao Zuying (Qinghua Univ., Beijing, BJ.(China). Inst. of Nuclear Energy Technology); Wang Chunyun. International Atomic Energy Agency, Vienna (Austria). Jan 1995. (CONF-9310429–: Technical committee meeting on response of fuel, fuel elements and gas cooled reactor cores under accidental air or water ingress conditions, Beijing (China), 25-27 Oct 1993). In *Response of fuel, fuel elements and gas cooled reactor cores under accidental air or water ingress conditions. Proceedings of a technical committee meeting held in Beijing, China, 25-27 October 1993.* 125p. Order Number DE95628012. Source: OSTI; NTIS (US Sales Only); INIS.

The high temperature gas-cooled test reactor HTR-10 is a graphite moderated and helium cooled reactor with a pebble bed core of spherical fuel elements. The primary system consists of reactor pressure vessel, steam generator vessel and hot gas duct vessel. The water ingress into HTR-10 reactor pressure vessel can occur for the accident of the rupture of the heat transfer tube of the steam generator. The mixture of helium and steam will enter the reactor with the stream. The transient behaviour of reactivity increase and graphite corrosion of both fuel elements and graphite structure caused by chemical reaction between graphite and steam are analyzed in order to evaluate the safety feature. The water ingress rate, reactivity increase, pressure and temperature transients in the primary system and graphite oxidation are analyzed by making use of the RETRAN code, THERMIX code and OXID-RE code. With the analytical results that the fuel element and graphite structure corrosion is not significant, the overpressurization of the reactor vessel is only for hypothetical accident. (author). 6 refs, 16, figs, 3 tabs.

The High Temperature Engineering Test Reactor (HTTR) is a graphite-moderated and helium gas-cooled reactor with prismatic fuel elements of hexagonal blocks. The graphite oxidation is one of the major concerns in the water ingress accident with respect to the structural integrity of the core. The water ingress accident is initiated by the rupture of a heat transfer tube in the primary pressurized water cooler. After the steam enters the core, it reacts with graphite structures. In order to evaluate the structural integrity of the graphite structures in the HTTR, the graphite oxidation analysis was made using the OXIDE-3F code. In the present study, it was confirmed that the graphite structures were not oxidized significantly because of rapid temperature decrease due to forced cooling by the auxiliary cooling system. It was also clarified that the water ingressed into the primary cooling system (PCS) did not lead significant pressure increment which could cause safety valve opening and consequent fission products release outside the PCS. (author). 6 refs, 14 figs, 1 tab.

The graphite has excellent nuclear and high temperature performance, and is used in atomic reactors with enormous quantities. The oxidation resistance of graphite is very poor, therefore, the application of graphite is only in restricted environment. SiC presents excellent ability of the oxidation resistance. It is reported in this paper that the uniform and dense SiC coating is formed by the reaction of the graphite matrix and melted silicon. Oxidation experiments show that, when samples were heated to 1000 deg. C in air for h hours, the graphite was burnt off 68 wt. %, whereas the coated graphite only 1.7 wt.%, and 1.0wt% at. 1500 deg. C in air for 2 hours. (author). 5 refs, 7 figs, 2 tabs.

Severe Accident Guidelines (SAGs) are being produced in line with best international practice for managing a severe accident in an AGR. Such an accident would be extremely unlikely due to the long timescales for recovery prior to core damage. A number of actions proposed in the SAGs are concerned with the prevention of air ingress and the deliberate injection of water into the core. Air ingress is minimized by sealing breaches and by the controlled injection of inert gases into the vessel, although at high temperatures the change in reactor gas from CO_2 to CO provides a more inert atmosphere and reduces any ingressing oxygen. Consideration would be given to the injection of water into the core if the installed cooling systems could not be recovered sufficiently in a direct or improvised manner. In such cases sufficient cooling should be possible by injecting water uniformly across the core into a few tens of channels. Ideally the water would be injected before significant fission product release had occurred and before the graphite had become hot enough to oxidise in steam. This advice is reinforced by experiments with a simulated fuel pin in the presence of reactor graphite which showed that fission products released from the pin could be transported on fine (0.1 μm) graphite aerosols. (author). 4 refs, 6 figs.

15445 (IAEA-TECDOC–784, pp. 116-120) **Study of the method to improve the corrosion resistance of the matrix materials of spherical fuel elements in HTGR.** Zhang Shichao (Qinghua Univ., Beijing, BJ (China). Ceramic fuel element is one of the most important items of HTGR technology, and the corrosion resistance of is matrix materials is vital to the operational performance of HTGR. In the paper, based on the oxidation study of the matrix materials, it has been proposed that the corrosion resistance of the matrix materials might be improved through forming carbon -ceramic composite. The experiment results have shown that the corrosion resistance of matrix materials has been improved by addition of SiC superfine powders, and that the matrix materials containing SiC superfine powders and heat-treated at 1600 deg. C had an oxidation rate lower than the general one containing no SiC superfine powder and heat-treated at 1950 deg. C. (author). 5 refs, 8 figs.

15446 (IAEA-TECDOC–784, pp. 120-124) **Ceramic coatings for HTR graphitic structures.** Hurtado, A.M. (Aachen Univ., Aachen (Germany). The main intention of ceramic coatings is to realize a corrosion resistance for graphitic structures in the temperature range of 450 to 1600 deg. C. To obtain a wide basis for producing these coated structures different graphite qualities were tested. For the production of ceramic coatings on silicon carbide basis different methods were applied. Industrial coatings were successfully produced with the slip casting method. Using chemical vapour deposition methods ceramic coatings were produced with excellent corrosion resistance. At the Technical University in Aachen and the Research Center in Juelich a special coating method being a combination of silicon infiltration and slip casting method was successfully developed for this kind of application. To characterize the produced coatings a lot of corrosion tests were carried out simulating hypothetical accident conditions in high temperature reactors (massive water and air ingress into the core) in the temperature range of 500 to 1500 deg. C. The gravimetrically measured reaction rates in air by equivalent air velocities amount to $R \leq 1$ mg/cm^{2}h. For simulated water ingress accidents the maximal reaction rates (T=800 deg. C) are 0,2mg/cm^{2}h. these results show, that a ceramic coating leads to very high corrosion resistance for graphitic core materials. (author). 6 refs, 5 figs, 2 tabs.

15447 (INIS-JP–039) **Present status of high temperature engineering test and research, 1994.** Japan Atomic Energy Research Inst., Oarai, Ibaraki (Japan). Oarai Research Establishment. Oct 1994. 104p. (In Japanese). Order Number DE95768257. Source: OSTI; NTIS; INIS.

High temperature gas-cooled reactors have excellent features such as the generation of high temperature close to 1000degC, very high inherent safety and high fuel burnup. By the advanced basic research under high temperature irradiation condition, the creation of various new technologies which become the momentum of future technical innovation can be expected. The construction of the high temperature engineering test reactor (HTTR) was decided in 1987, which aims at the thermal output of 30 MW and the coolant temperature at reactor exit of 950degC. The initial criticality is scheduled in 1998. Japan Atomic Energy Research Institute has advanced the high temperature engineering test and research, and plans the safety verifying test of the HTTR, the test of connecting heat utilization plants and so on. In this report, mainly the results obtained for one year from May, 1993 are summarized. The outline of the high temperature engineering test and development of the HTTR technologies are reported. (K.I.).

A mathematical model of the structural confinement system or the Accident Confinement System (ACS) of the RBMK-1500 reactors is presented. The system is required to prevent the release of radioactive products from reaching the environment in case of an accident in the reactor's cooling system. The mathematical model of the structure is subjected to the specified design pressures. The results are analysed with respect to wall deflections and maximum stresses in the reinforcing bars which maintain the integrity of the

ACS walls. They indicate excessive deflections of the walls and stresses in reinforcement in certain areas of the ACS. (orig.) (4 refs., 10 figs.).

15449 (BARC–1994/E/031) **Generation of data base for on-line fatigue life monitoring of Indian nuclear power plant components: Part I - Generation of Green's functions for end fitting.** Mukhopadhyay, N.K. (Bhabha Atomic Research Centre, Bombay (India). Reactor Engineering Division); Dutta, B.K.; Kushwaha, H.S. Bhabha Atomic Research Centre, Bombay (India). 1994. 28p. Order Number DE95628021. Source: OSTI; NTIS (US Sales Only); INIS.

Green's function technique is the heart of the on- line fatigue monitoring methodology. The plant transients are converted to stress and temperature response using this technique. To implement this methodology in a nuclear power plant, Green's functions are to be generated in advance. For structures of complex geometries, Green's functions are to be stored in a data base to convert on-line, the plant data to temperature/stress response, using a personal computer. End fitting, end shield, pressurizer, steam generator tube sheet are few such components of PHWR where fatigue monitoring is needed. In the present paper, Green's functions are generated for end fitting of a 235 MWe Indian PHWR using finite element method. End fitting has been analysed using both 3-D and 2-D (axisymmetric) finite element models. Temperature and stress Green's functions are generated at few critical locations using the code ABAQUS. (author). 10 refs., 11 figs.

15450 (BARC–1994/E/032) **Elasto-plastic finite element analysis of axial surface crack in PHT piping of 500 MWe PHWR.** Chawla, D.S. (Bhabha Atomic Research Centre, Bombay (India). Reactor Engineering Div.); Bhate, S.R.; Kushwaha, H.S.; Mahajan, S.C. Bhabha Atomic Research Centre, Bombay (India). 1994. 60p. Order Number DE95628022. Source: OSTI; NTIS (US Sales Only); INIS.

The leak before break (LBB) approach in nuclear piping design envisages demonstrating that the pressurized pipe with a postulated flaw will leak at a detectable rate leading to corrective action well before catastrophic rupture would occur. This requires analysis of cracked pipe to study the crack growth and its stability. This report presents the behaviour of a surface crack in the wall of a thick primary heat transport (PHT) pipe of 500 MWe Indian PHWR. The line spring model (LSM) finite element is used to model the flawed pipe geometry. The variation of crack driving force (J-integral) across the crack front has been presented. The influence of crack geometry factors such as depth, shape, aspect ratio, and loading on peak values of J-integral as well as crack mouth opening displacement has been studied. Several crack shapes have been used to study the shape influence. The results are presented in dimensionless form so as to widen their applicability. The accuracy of the results is validated by comparison with results available in open literature. (author). 47 refs., 8 figs.

15451 (BARC–1994/E/037) **"HFLOWR" - a computer code for predicting flow regimes in a horizontal channel with rod cluster.** Lele, H.G. (Bhabha Atomic Research Centre, Bombay (India). Reactor Safety Div.); Gupta, S.K.; Venkat Raj, V. Bhabha Atomic Research Centre, Bombay (India). 1994. 57p. Order Number DE95628023. Source: OSTI; NTIS (US Sales Only); INIS.

Indian Pressurised Heavy Water Reactors have horizontal channels containing rod clusters. Occurrence of flow stratification under postulated accident conditions , significantly affects the temperatures of the exposed fuel rods. The various thermodynamic models that are to be used for the analysis depend on the flow regimes, which are expected to occur in the channel. A computer program HFLOWR has been developed to obtain the dimensionless flow regime maps and flow patterns in reactor channels of Indian PHWR under various coolant conditions. This code can be integrated with the safety analysis code, for flow regime prediction under transient/accident conditions. This report describes the various mathematical formulations used in the code and the various analyses done using this code. (author). 6 refs., 1 appendix, 34 figs.

15452 (ANL/IFR/CP–83257) **System modeling of spent fuel transfers at EBR-II.** Imel, G.R. (Argonne National Lab., Idaho Falls, ID (United States)); Houshyar, A. Argonne National Lab., Idaho Falls, ID (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941207–32: Spent nuclear fuel meeting: challenges and initiatives, Salt Lake City, UT (United States), 14-16 Dec 1994). Order Number DE95009910. Source: OSTI; NTIS; INIS; GPO Dep.

The unloading of spent fuel from the Experimental Breeder Reactor-II (EBR-II) for interim storage and subsequent processing in the Fuel Cycle Facility (FCF) is a multi-stage process, involving complex operations at a minimum of four different facilities at the Argonne National Laboratory-West (ANL-W) site. Each stage typically has complicated handling and/or cooling equipment that must be periodically maintained, leading to both planned and unplanned downtime. A program was initiated in October, 1993 to replace the 330 depleted uranium blanket subassemblies (S/As) with stainless steel reflectors. Routine operation of the reactor for fuels performance and materials testing occurred simultaneously in FY 1994 with the blanket unloading. In the summer of 1994, Congress dictated the October 1, 1994 shutdown of EBR-2. Consequently, all blanket S/As and fueled drivers will be removed from the reactor tank and replaced with stainless steel assemblies (which are needed to maintain a precise configuration within the grid so that the under sodium fuel handling equipment can function). A system modeling effort was conducted to determine the means to achieve the objective for the blanket and fuel unloading program, which under the current plan requires complete unloading of the primary tank of all fueled assemblies in 2 1/2 years. A simulation model of the fuel handling system at ANL-W was developed and used to analyze different unloading scenarios; the model has provided valuable information about required resources and modifications to equipment and procedures. This paper reports the results of this modeling effort.

15453 (DOE/RL–94-137) **Radioactive air emissions notice of construction Sodium Storage Facility.** Homan, N.A. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95009139. Source: OSTI; NTIS; INIS; GPO Dep.

The mission of the Sodium Storage Facility (SSF) is to receive molten sodium coolant from the Fast Flux Test Facility (FFTF), store the sodium in a solid state for an extended period, and then melt the sodium for transfer to a future Sodium Reaction Facility. SSF is required for sodium offload during FFTF transition to a safe, stable condition for long-term surveillance and maintenance pending final decommissioning. About 984,100 liters of sodium will be offloaded from FFTF to tank storage in SSF during this transition period. Unused carbon steel sodium tanks originally built for the Clinch River Breeder Reactor plant will be used. Once the storage tanks are in place, a concrete building will be constructed around and over them to provide shielding and weather protection. This document serves as a notice of construction pursuant to the requirements of Washington Administrative Code WAC 246-247-060 and as a request for approval to construct pursuant to 40 Code of Federal Regulations CFR 61.96 for SSF. Information is arranged to closely reflect the order of the requirements in WAC 246-247-110.

Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–23: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Source: OSTI; NTIS; INIS.

In accordance with the standard design certification process established under the rules of 10 CFR, Part 52, the NRC staff will use design acceptance criteria (DAC) verified by inspections, tests, analyses and acceptance criteria (ITAAC) to make safety determinations for technical areas of advanced standardized nuclear plant designs for which final design information is not available. Piping and pipe support design has been identified as one such technical area. One element of the DAC for piping requires the applicant for a combined license to verify the sufficiency of the computer codes and modeling techniques to be used to complete its piping stress analyses. To provide the basis for this verification the staff sponsored the development of piping benchmark problems for the General Electric Advanced Boiling Water Reactor (ABWR), the ABB/Combustion Engineering System 80+ and the Westinghouse AP600 standardized reactor designs. These analytical problems involve the modeling of representative piping systems subjected to plant specific dynamic loads with solutions developed using the proposed for analysis for each standardized design. A summary description of each problem and the acceptance criteria to be met are included.

This monthly publication contains descriptions of the information received and generated by the US Nuclear Regulatory Commission (NRC). This information includes (1) docketed material associated with civilian nuclear power plants and other uses of radioactive materials and (2) nondocketed material received and generated by NRC pertinent to its role as a regulatory agency. As used here, docketed refers to the system by which NRC maintains its regulatory records. This series of documents is indexed by a Personal Author Index, a Corporate Source Index, and a Report Number Index. NRC documents that are publicly available may be examined without charge at the NRC Public Document Room (PDR).

15457 (NUREG–1525) **Assessment of the NRC Enforcement Program.** Lieberman, J.; Coblentz, L. Nuclear Regulatory Commission, Washington, DC (United States). Apr 1995. 196p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

On May 12, 1994, the Executive Director for Operations (EDO) established a Review Team composed of senior NRC managers to re-examine the NRC enforcement program. A copy of the Review Team's charter is enclosed as Appendix A. This report presents the Team's assessment. The purpose of this review effort are: (1) to perform an assessment of the NRC's enforcement program to determine whether the defined purposes of the enforcement program are appropriate; (2) to determine whether the NRC's enforcement practices and procedures for issuing enforcement actions are consistent with those purposes; and (3) to provide recommendations on any changes the Review Team believes advisable. In accordance with its charter, the Review Team considered the following principal issues in conducting its assessment of the enforcement program: the balance between providing deterrence and incentives (both positive and negative) for the identification and correction of violations; the appropriateness of NRC sanctions; whether the commission should seek statutory authority to increase the amount of civil penalties; whether the NRC should use different enforcement policies and practices for different licensees (e.g., materials licensees in contrast to power reactors or large fuel facilities); and whether the commission should establish open enforcement conferences as the normal practice.

15459 (BARC–1994/E/039) **An improved scheme for the evaluation of λ-modes of a multi-group neutron diffusion equation.** Modak, R.S. (Bhabha Atomic Research Centre, Bombay (India). Theoretical Physics Div.); Jain, V.K.; Gupta, H.P. Bhabha Atomic Research Centre, Bombay (India). 1994. 26p. Order Number DE95627961. Source: OSTI; NTIS (US Sales Only); INIS.

The λ-modes of a nuclear reactor, which are the higher eigenfunctions of the multiplication eigenvalue problem in multi-group neutron diffusion theory, are required in several reactor applications. The evaluation of these modes is a task involving a significant computational effort. Here, a scheme is presented to find these modes, which is versatile, easy to implement and suitable for parallel processing. In this scheme, the fission source method, earlier developed by us, has been substantially improved by incorporating the novel technique of sub-space iteration for non-symmetric eigenvalue problems. The scheme is validated against the well-known Subtraction Method by finding the modes of a test-case, which represents a typical large-sized Pressurised Heavy Water Reactor. (author). 8 refs., 1 fig., 7 tabs.

15460 (IAE–2158/2) **Application of WIMSD-4 for "MARIA" reactor lattice calculations.** Andrzejewski, K. (Institute of Atomic Energy, Otwock-Swierk (Poland)); Kulikowska, T. Institute of Atomic Energy, Otwock-Swierk (Poland). Dec 1993. 44p. Order Number DE95628733. Source: OSTI; NTIS; INIS.

A general description of the WIMSD-4 lattice code is given with the emphasis on available geometrical models. The difficulties encountered while modelling reactor lattices with the tubular type fuel elements are explained. Then the analysis of code options allowing to overcome these difficulties is carried out. Eventually, recommendations of options and input parameters for calculations of MARIA reactor lattice with satisfactory accuracy are given. During the work a set of modifications had to be introduced leading to a new code version called WIMS-S. Another version, under the name WIMS-T has been developed to allow for burnup calculations of the MARIA reactor lattice with improved resonance approach. (author). 14 refs, 6 figs, 10 tabs.

Fracture control of structures is the concerted efforts by designers, metallurgists, production and maintenance engineers and inspectors to ensure safe operation without catastrophic fracture failures. If fracture is to be prevented, the strength should not drop below a certain safe value which means that cracks must be prevented to reach a critical size. Since piping is very important component in nuclear power plants, fracture control plans have been employed increasingly to ensure for better plant availability. Leak-before break (LBB) is now widely applied in nuclear industries as a means of assessing the susceptibility of a pressurised components to failure by unstable crack growth. In this report experimental and analytical studies are conducted on circumferential through wall cracked pipe subjected to pure bending load. Pipes made of three different types of steels are tested with crack size varying from 15% to 50% of circumference. Experimental results pertaining to fracture load, crack mouth opening displacement (CMOD), load point rotation and J-integral are presented. Prediction of maximum moment and stress based on net-section collapse (NSC) method and modified NSC method are also presented and compared with experimental data. Comparison between experimental and analytical results were found to be good. These all studies throw some more light on the understanding of the pipe fracture and relative accuracy and margin of conservatism of the methods when applied to full scale set up. (author). 32 refs., 45 figs., 12 tabs., 2 appendixes.

15463 (BNL-NUREG–61558) **Flexible piping design: A case study.** Bezler, P.; DeGrassi, G. Brookhaven National Lab., Upton, NY (United States). [1995]. 10p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-950740–24: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Source: OSTI; NTIS; INIS.

Flexible piping in an objective of current piping design. Such piping design can lead to some unexpected and unusual characteristics. These characteristics are demonstrated through a case study of a pressurizer surge line designed to have a low fundamental frequency and essentially no intermediate seismic constraints in the vertical direction. Results for envelope response spectra, multiple response spectra and time history methods of analysis are compared. The envelope response spectra method is shown to provide non-conservative estimates of system response for some conditions.

15464 (CONF-950740–16) **Validation of favor code linear elastic fracture solutions for finite-length flaw geometries.** Dickson, T.L.; Keeney, J.A.; Bryson, J.W. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. Agreement Number 1886-8084-5B. From Joint ASME/JSME pressure vessels and piping conference; Honolulu, HI (United States); 23-27 Jul 1995. Order Number DE95009034. Source: OSTI; NTIS; INIS; GPO Dep.

One of the current tasks within the US Nuclear Regulatory Commission (NRC)-funded Heavy Section Steel Technology Program (HSST) at Oak Ridge National Laboratory (ORNL) is the continuing development of the FAVOR (Fracture, analysis of Vessels: Oak Ridge) computer code. FAVOR performs structural integrity analyses of embrittled nuclear reactor pressure vessels (RPVs) with stainless steel cladding, to evaluate compliance with the applicable regulatory criteria. Since the initial release of FAVOR, the HSST program has continued to enhance the capabilities of the FAVOR code. ABAQUS, a nuclear quality assurance certified (NQA-1) general multidimensional finite element code with fracture mechanics capabilities, was used to generate a database of stress-intensity-factor influence coefficients (SIFICs) for a range of axially and circumferentially oriented semielliptical inner-surface flaw geometries applicable to RPVs with an internal radius (Ri) to wall thickness (w) ratio of 10. This database of SIRCs has been incorporated into a development version of FAVOR, providing it with the capability to perform deterministic and probabilistic fracture analyses of RPVs subjected to transients, such as pressurized thermal shock (PTS), for various flaw geometries. This paper discusses the SIFIC database, comparisons with other investigators, and some of the benchmark verification problem specifications and solutions.

15465 (INIS-JP–027, pp. 3-7) **Toward autonomous operation and maintenance of nuclear power plants.** Kitamura, M. (Tohoku Univ., Sendai (Japan). Faculty of Engineering). Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

Issues toward realization of autonomous operation as well as maintenance of nuclear power plants are reviewed in this paper. First, the necessity and significance of the technical program aiming at the establishment of autonomous nuclear plant are discussed through reviewing the history and current status computerized operation of complex artifacts. Then, key technologies currently studied to meet the need within the framework of artificial intelligence (AI) and advanced robotics are described. Among such AI-technologies are distributed multi-agent system, operator thinking model, and advanced man-machine interface design. Advances in robot technology attained include active sensing technique and multi-unit autonomous maintenance robot systems. Techniques for simulation of human action have been pursued as basic issues for understanding mechanisms behind human behavior. In addition to the individual developments, methodological topics relevant to the autonomy of nuclear facilities are briefly addressed. The concepts called methodology diversity and dynamic functionality restoration (realization) are introduced and discussed as the underlining principles to be considered in the development of the autonomous nuclear power plants. (author).

15466 (INIS-JP–027, pp. 11-20) **Task oriented evaluation system for maintenance robots.** Asame, Hajime (Institute of Physical and Chemical Research, Wako, Saitama (Japan)); Endo, Isao; Kotosaka, Shin-ya; Takata, Shozo; Hiraoka, Hiroyuki; Kohda, Takehisa; Matsumoto, Akihiro; Yamagishi, Kiichiro. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

The adaptability evaluation of maintenance robots to autonomous plants has been discussed. In this paper, a new concept of autonomous plant with maintenance robots are introduced, and a framework of autonomous maintenance system is proposed. Then, task-oriented evaluation of robot arms is discussed for evaluating their adaptability to maintenance tasks, and a new criterion called operability is proposed for adaptability evaluation. The task-oriented evaluation system is implemented and applied to structural

design of robot arms. Using genetic algorithm, an optimal structure adaptable to a pump disassembly task is obtained. (author).

15467 (INIS-JP–027, pp. 21-32) **Geometric programming facilities of EusLisp and assembly goal planner.** Matsui, Toshihiro (Electrotechnical Lab., Tsukuba, Ibaraki (Japan)); Sakane, Shigeyuki; Hirukawa, Hirohisa. Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

For robots in power plants to accomplish intelligent tasks such as maintenance, inspection, and assembly, the robots must have planning capabilities based on shape models of the environment. Such shape models are defined and manipulated by a program called a geometric modeler or a solid modeler. Although there are commercial solid modelers in the market, they are not always suitable for robotics research, since it is hard to integrate higher level planning functions which frequently access internal model representation. In order to accelerate advanced robotics research, we need a generic, extensible, efficient, and integration-oriented geometric modeler. After reviewing available modelers, we concluded that the object-oriented Lisp can be the best implementation language for solid modeling. The next section introduces the programming language, 'EusLisp', tuned for implementing a solid modeler for intelligent robot programming. The design philosophy and the structure and functions of EusLisp are stated. In the following sections, EusLisp's applications, i.e., viewpoint and light-source location planning, derivation of motion constraint, and assembly goal planning, are discussed. (J.P.N.).

15468 (INIS-JP–027, pp. 33-44) **Present status of an integrated software system for HASP (Human Acts Simulation Program).** Otani, Takayuki (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Ebihara, Ken-ichi; Kambayashi, Shaw; Kume, Etsuo; Higuchi, Kenji; Fujii, Minoru; Akimoto, Masayuki. Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

In Human Acts Simulation Program (HASP), human acts to be realized by a human-shaped intelligent robot in a nuclear power plant are simulated by computers. The major purpose of HASP is to develop basic and underlying design technologies for intelligent and automatic power plant. The objectives of this paper is to show the present status of the HASP, with particular emphasis on activities targetted at the integration of developed subsystems to simulate the important capabilities of the intelligent robot such as planning, robot dynamics, and so on. (author).

15469 (INIS-JP–027, pp. 45-56) **A measured-ZMP(Zero-Moment-Point)-referenced control of biped locomotion robots.** Kume, Etsuo (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment); Akimoto, Masayuki. Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

For the control of biped locomotion, the model-referenced-control or programmed control method is widely used. In this method, the instantaneous torque of actuator equipped at each joint is controlled so as to equalize measured angle to input joint angle based on the prescribed motion. The drawback is that this method can not deal with the dynamic change of walking such as that due to unknown external force. To resolve such the drawback, we propose a new control method as follows: given a prescribed motion as a set of gait, namely gait of starting walk, cyclic walk, and stopping walk including a standard trajectory of the Zero-Moment-Point (ZMP), the trunk motion to compensate the legs' motion is generated in real time using the current ZMP measured by sensing device. The proposed method will be validated through some numerical simulations. (author).

15470 (INIS-JP–027, pp. 59-70) **Deep knowledge and knowledge compilation for dynamic systems.** Mizoguchi, Riichiro (Osaka Univ., Ibaraki (Japan). Inst. of Scientific and Industrial Research). Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

Expert systems are viewed as knowledge-based systems which efficiently solve real-world problems based on the expertise contained in their knowledge bases elicited from domain experts. Although such expert systems that depends on heuristics of domain experts have contributed to the current success, they are known to be brittle and hard to build. This paper is concerned with research on model-based diagnosis and knowledge compilation for dynamic systems conducted by the author's group to overcome these difficulties. Firstly, we summarize the advantages and shortcomings of expert systems. Secondly, deep knowledge and knowledge compilation is discussed. Then, latest results of our research on model-based diagnosis is overviewed. The future direction of knowledge base technology research is also discussed. (author).

15471 (INIS-JP–027, pp. 71-82) **Distributed and organized decision making under resource boundedness.** Sawaragi, Tetsuo (Kyoto Univ. (Japan). Faculty of Engineering). Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

The coming bottleneck to be overcome in the era of the distributed and open-architectured environment will be the establishment of the rational design and coordination of the total system where multiple decision makers, problem solvers and automated machinery components coexist interacting with each other. In such an environment, they are not achieving some absolute standard of performance with unlimited amounts of resources nor with simple algorithms, but is doing as well as possible given what resources one has. In this article, we focus on the potentials of decision theory as a tool for tackling with the limited rationality under resource boundedness. First, the bottlenecks for establishing the organized and distributed decision making are summarized, and the importance of the formalization of decision activities of intelligent agents is stressed to establish an efficient and effective cooperation by distributed and organized decision making and/or problem solving. Some of the practical systems developed based on such a principle are reviewed briefly with respect to the real-time man-machine collaboration and the cooperative computational framework for the intelligent mobile robots. (author).

15472 (INIS-JP–027, pp. 83-94) **Using Specification and Description Language (SDL) for capturing and reusing human experts' knowledge.** Far, B.H. (Saitama Univ., Urawa (Japan). Faculty of Engineering); Koono, Zenya. Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

Conventional knowledge engineering techniques for acquiring experts' knowledge can not produce quality knowledge due to improper knowledge documentation and informal knowledge acquisition method. We propose a new method for knowledge documentation and acquisition using Specification and Description Language (SDL). SDL is used to describe both the target system and the reasoning process. The main idea is to follow deterministic problem solving behavior of human experts and document it. Then

knowledge can be extracted by comparing documents of the successive steps. This knowledge is recorded and reused in similar or novel cases. We present an implementation of this method in a tool for software design. The implemented system consists of a SDL CASE tool and an expert system for applying the design knowledge. This system serves as an experimental platform for the study of human design by simulating the design at the lowest level. However, we have found that by acquiring enough domain knowledge, this system can simulate general problem solving of human experts. (author).

15473 (INIS-JP–027, pp. 95-106) **A qualitative model construction method of nuclear power plants for effective diagnostic knowledge generation.** Yoshikawa, Shinji (Power Reactor and Nuclear Fuel Development Corp., Oarai, Ibaraki (Japan). Oarai Engineering Center); Endou, Akira; Kitamura, Yoshinobu; Sasajima, Munehiko; Ikeda, Mitsuru; Mizoguchi, Riichiro. Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

This paper discusses a method to construct a qualitative model of a nuclear power plant, in order to generate effective diagnostic knowledge. The proposed method is to prepare deep knowledge to be provided to a knowledge compiler based upon qualitative reasoning (QR). Necessity of knowledge compilation for nuclear plant diagnosis will be explained first, and conventionally-experienced problems in qualitative reasoning and a proposed method to overcome this problem is shown next, then a sample procedure to build a qualitative nuclear plant model is demonstrated. (author).

15474 (INIS-JP–027, pp. 109-119) **Swarm Intelligence systems.** Beni, G. (California Univ., Reverside, CA (United States). Coll. of Engineering). Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

We review the characteristics of Swarm Intelligence and discuss systems exhibiting it. The recently developed mathematical description of Swarm behavior is also reviewed and discussed. The self-organization of Swarms is described as the reconfiguring asynchronously and conservatively of a distribution. Swarm reconfigurations are based on producing distributions that are solutions to systems of linear equations. Conservation and asynchronicity are related, respectively, to the global and local nature of the Swarm problem. The conditions for the convergence of the Swarm algorithm are presented. The important point is that, under very general conditions, the Swarm reconfigures in a time which is independent of the size of the Swarm. This fact implies that a centralized controller can never reconfigure as fast as a Swarm provided the size of the Swarm is large enough. This result is related to the unpredictability of the Swarm, a basic property of Swarm Intelligence. Finally, the conditions under which Swarm algorithms become of practical importance are discussed and examples given. (author).

15475 (INIS-JP–027, pp. 131-142) **Development of a super-redundant multijoint manipulator for maintenance of nuclear reactors.** Ma, Shugen (Ibaraki Univ., Hitachi (Japan). Faculty of Engineering); Hirose, Shigeo. Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

A tendon-driven manipulator, the CT Arm, has a specific tendon traction transmission mechanism, in which a pair of tendons for driving a joint is pulled from base actuators via pulleys mounted on the based-side joints. The mechanism makes the most of the coupled drive function of the tendon tractions and thus enables the lightweight manipulator to exhibit enormous payload capability. By this tendon-driven mechanism, a multijoint manipulator with super-redundant degrees of freedom could be realized, which is suitable to the maintenance of nuclear reactors. In this article, we introduce the CT Arm and discuss the possibility to generate a multijoint maintenance manipulator which has a super-redundant degrees of freedom. (author).

15476 (INIS-JP–027, pp. 179-190) **Application of coupled symbolic and numeric processing to an advanced scheduling system for plant construction.** Kobayashi, Yasuhiro (Hitachi Ltd., Ibaraki (Japan). Energy Research Lab.); Takamoto, Masanori; Nonaka, Hisanori; Yamada, Naoyuki. Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants.* Order Number DE95709894. Source: OSTI; NTIS; INIS.

A scheduling system has been developed by integrating symbolic processing functions for constraint handling and modification guidance, with numeric processing functions for schedule optimization and evaluation. The system is composed of an automatic schedule generation module, interactive schedule revision module and schedule evaluation module. The goal of the problem solving is the flattening of the daily resources requirement throughout the scheduling period. The automatic schedule generation module optimizes the initial schedule according to the formulatable portion of requirement description specified in a predicate-like language. A planning engineer refines the near-goal schedule through a knowledge-based interactive optimization process to obtain the goal schedule which fully covers the requirement description, with the interactive schedule revision module and schedule evaluation module. A scheduling system has been implemented on the basis of the proposed problem solving framework and experimentally applied to real-world sized scheduling problems for plant construction. With a result of the overall plant construction scheduling, a section schedule optimization process is described with the emphasis on the symbolic processing functions. (author).

15477 (WSRC-MS–95-0008) **Analytical considerations in the code qualification of piping systems.** Antaki, G.A. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950740–7: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95006473. Source: OSTI; NTIS; INIS; GPO Dep.

The paper addresses several analytical topics in the design and qualification of piping systems which have a direct bearing on the prediction of stresses in the pipe and hence on the application of the equations of NB, NC and ND-3600 of the ASME Boiler and Pressure Vessel Code. For each of the analytical topics, the paper summarizes the current code requirements, if any, and the industry practice.

15478 (INIS-JP–029, pp. 60-62) **Basic study on the secondary hydride in zircaloy claddings by means of the nuclear reaction analysis.** Hattori, Takayuki (Kyoto Univ. (Japan). Faculty of Engineering); Hashizumi, Masatsugu; Takagi, Ikuji; Higashi, Kunio. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Deuterium depth profiles in zircaloy claddings were observed with the nuclear reaction $D(^3He,p)^4He$. The concentration of deuterium in the zircaloy-2 cladding with a zirconium liner depended on the cooling rate after deuterium absorption at 673K. In the case of slow cooling rate, the deuterium concentration in the liner was

very high, while that in the zircaloy cladding was low. The zircaloy-4 cladding covered with nickel, absorbed more deuterium than that with base surfaces. (author).

15479 (ORNL/TM–12788) **Creep analysis of fuel plates for the Advanced Neutron Source.** Swinson, W.F.; Yahr, G.T. Oak Ridge National Lab., TN (United States). Nov 1994. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008646. Source: OSTI; NTIS; INIS; GPO Dep.

The reactor for the planned Advanced Neutron Source will use closely spaced arrays of fuel plates. The plates are thin and will have a core containing enriched uranium silicide fuel clad in aluminum. The heat load caused by the nuclear reactions within the fuel plates will be removed by flowing high-velocity heavy water through narrow channels between the plates. However, the plates will still be at elevated temperatures while in service, and the potential for excessive plate deformation because of creep must be considered. An analysis to include creep for deformation and stresses because of temperature over a given time span has been performed and is reported herein.

15480 (STUDSVIK-N(H)–94-13) **Investigation of fuel behaviour at different power levels (SKI-bump II). Final report.** Lysell, G.; Bengtsson, Sven. Studsvik Nuclear, Nykoeping (Sweden). 1994. 73p. Order Number DE95626846. Source: OSTI; NTIS; INIS.

Fuel microstructure and fission product redistribution in the fuel and to the cladding inside were studied after a 'bump' irradiation of a high burnup rod up to maximum Linear Heat Rating (LHR) of 43 kW/m. Fission gas induced swelling of the fuel imposed a large strain on the cladding. Total gas release in the rod as well as the local release at two different LHRs were measured. Reference fuel not subject to the bump was examined with the same techniques as the bumped fuel.

Argonne National Lab., Idaho Falls, ID (United States). [1994]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941216–3: 33. Institute of Electrical and Electronic Engineers (IEEE) conference on decision and control, Orlando, FL (United States), 14-16 Dec 1994). Order Number DE95009909. Source: OSTI; NTIS; INIS; GPO Dep.

This paper presents a reconfigurable approach to decision and control systems for complex dynamic processes. The proposed supervisory control system is a reconfigurable hybrid architecture structured into three functional levels of hierarchy, namely, execution, supervision, and coordination. While, the bottom execution level is constituted by either reconfigurable continuously varying or discrete event systems, the top two levels are necessarily governed by reconfigurable sets of discrete event decision and control systems. Based on the process status, the set of active control and supervisory algorithm is chosen. The reconfigurable hybrid system is briefly described along with a discussion on its implementation at the Experimental Breeder Reactor 2 of Argonne National Laboratory. A process control application of this hybrid system is presented and evaluated in an in-plant experiment.

15482 (IAEA–12-SP-384.37) **Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.** International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. 301p. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

The main objective of the meeting is to provide a forum for exchange of information among the participating experts both at this meeting and later through the publication of the meeting's proceedings. The following topics are considered: experiences from use of information technology in the control room, including operator interfaces, operator support systems and complete control rooms; human aspects of introducing information technology in the control room; design and evaluation of advanced control rooms. 26 papers were presented at the meeting. A separate abstract was prepared for each of these papers. Refs, figs and tabs.

In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

The concept of an Integrated Surveillance And Control System (ISACS) has been developed into a prototype, ISACS-1, which presently is in operation at the simulator-based experimental control room HAMMLAB of the OECD Halden Reactor Project. Characteristics of ISACS is that it covers the whole interface between the process and the operator, and this interface is fully computerized using tools like Cathode Ray Tubes (CRTs) and dynamic keyboards. In addition, a large number of computerized operator support systems (COSSs) are included in ISACS, assisting the operator in functions like disturbance detection and diagnosis, identification of relevant actions, and implementation of procedures. An information coordinator called "Intelligent Coordinator" (IC) in ISACS observes the information received from the process and the COSSs, generates new high-level information and structures and prioritizes information to be presented to the operator. The limited ISACS-1 prototype was completed in early 1991. An extensive evaluation programme is in progress. This paper will describe main features of the system and some of the conclusions to be drawn from the evaluation programme. (author). 5 refs, 2 figs.

15485 (IAEA–12-SP-384.37, pp. 20-23) **Occurrences in control room equipment, procedures and personnel performances: IRS control room events.** Tolstykh, V. (International Atomic Energy Agency, Vienna (Austria)). International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

The IAEA/NEA Incident Reporting System (IRS) was established in the early 1980, its objective being to gain from operating experience achieved in countries with nuclear power programmes by

means of exchanging information on events relevant to safety. Among the 2171 events in the database, 175 events (i.e. 8%) were identified as "control room events". It was decided to group these into three sets for further study: 65 events with common mode/ cause failures (CCFs), 22 events with cognitive errors and 30 events with unforeseen interaction between NPP systems. It is expected that the pitfalls experienced in the IRS and the questions derived from this study will help to gain a better understanding of the needs and interests of specialists in advanced information methods and artificial intelligence in NPP control rooms. (author).

15486 (IAEA–12-SP-384.37, pp. 24-35) **Optimization of advanced plants operation: The Escrime project.** Fiche, C. (CEA Centre d'Etudes de Cadarache, 13 - Saint-Paul-lez-Durance (France)); Papin, B. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

The Escrime program aims at defining the optimal share of tasks between humans and computers under normal or accidental plant operation. Basic principles we keep in mind are the following: human operators are likely to be necessary in the operation of future plants because we cannot demonstrate that plant design is error free, so unexpected situation can still happen; automation must not release the operators from their decisional role but only help them avoiding situations of cognitive overload which can lead to increase the risk of errors; the optimum share of tasks between human and automatic systems must be based on a critical analysis of the tasks and of the way they are handled. The last point appeared to be of major importance. The corresponding analysis of the French PWR's operating procedures enabled us to define a unified scheme for plant operation under the form of a hierarchy of goals and means. Beyond this analysis, development of a specific testing facility is under way to check the relevance of the proposed plant operation organization and to test the human-machine cooperation in different situations for various levels of automation. 7 refs, 4 figs.

15487 (IAEA–12-SP-384.37, pp. 36-47) **Experience with the upgraded VERONA-u WWER-440 core monitoring system.** Lux, I. (KFKI-Atomic Energy Research Inst., Budapest (Hungary)); Vegh, J.; Adorjan, F.; Buerger, L. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes the components, functioning and services of the VERONA-u core monitoring system recently installed at Unit 2 and 3 of the Hungarian Paks NPP. The VERONA-u is a totally upgraded and modernized version of the previous VERONA system, in the upgrading project the data-concentrator, the host computer and the operators' displays were replaced by state-of-the-art hardware and software components. Dual hardware redundancy and automatic function recovery actions were introduced in order to ensure high system availability. The man-machine interface has been redesigned completely, applying X Windows as Graphical User Interface. Improved core analysis and power reconstruction methods were introduced, together with a detailed hot-spot monitoring algorithm. A capable archivation module ensures periodic logging of all measured data, change sensitive storage of important signal changes and provides sophisticated post-mortem analysis tools. The upgraded system has been working satisfactorily on Unit 2 for a complete fuel cycle by now, the on-line system response in complex, transient situations is illustrated in the paper. (author). 10 refs, 4 figs.

15488 (IAEA–12-SP-384.37, pp. 48-57) **Experience from development and operation of the core surveillance systems SCORPIO.** Berg, O. (Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt); Porsmyr, J.; Adlandsvik, K.A. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

The main motivation behind the development of SCORPIO is to make a practical tool for reactor operators which can increase the quality and quantity of information presented on core status and dynamic behaviour. This can first of all improve plant safety as undesired core conditions are detected and prevented. Secondly, more flexible and efficient plant operation is made possible. These improvements are obtained by better surveillance of core instrumentation and through detailed calculations of core behaviour using on-line simulators. The SCORPIO system has two parallel modes of operation: the Core Follow Mode and the Predictive Mode. The system has been in operation at the Ringhals PWR unit 2 in Sweden since the end of 1987 where it runs on Norsk Data mini-computers. Recently, there has been a renewed interest for SCORPIO mainly determined by the utilities' desire to obtain more economical and flexible plant operation. The SCORPIO system has been transferred to Unix based workstations and integrated with the Picasso-2 graphics system. In addition to Ringhals the new system is currently being installed at Nuclear Electri's Sizewell B PWR in UK and Duke Power's Catawba Unit 1,2 and McGuire Unit 1,2, USA. (author). 7 refs, 5 figs.

15489 (IAEA–12-SP-384.37, pp. 86-93) **Guidelines for the presentation of emergency operating procedures using advanced information technology.** Green, M. (Human Reliability Associates Ltd., Dalton (United Kingdom)); Hollnagel, E.; Niwa, Yuji. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

New methods of information presentation and interface design are changing the conditions for work in the modern NPP control room. One area receiving considerable attention is that of Emergency Operating Procedures (EOP). Conventionally such procedures are presented using hard copy manuals; however, development in IT means that there are new opportunities for the computerization of such procedures. This paper reports on the development of human factors guidelines for the computerized presentation of EOPs. After identifying the principle stages in the transition from procedures as documents to fully automated procedures, computerised procedure presentation is briefly discussed. Guidelines for the presentation of such procedures are outlined starting with the high level goals for guidelines themselves. Such goals also constitute the criteria against which the computerized procedures are measured during implementation. Six dimensions describing computerized procedure presentation are presented and two are explore in more detail by identifying points along each dimension that characterize different levels of IT sophistication. (author). 8 refs, 1 tab.

Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

Human factors application to nuclear power plant (NPP) design, especially, to man-machine interface system (MMIS) design becomes an important issue among the licensing requirements. Recently, the nuclear regulatory bodies require the evidence of systematic human factors application to the MMIS design. Human Factors Engineering Program Plan (HFEPP), as a basis and central one among the human factors application by the MMIS designers. This paper describes the framework of HFEPP for the MMIS design of next generation NPP (NG-NPP) in Korea. This framework provides an integral plan and some bases of the systematic application of human factors to the MMIS design, and consists of purpose and scope, codes and standards, human factors organization, human factors tasks, engineering control methodology, human factors documentations, and milestones. The proposed HFEPP is a top level document to define and describe human factors tasks, based on each step of MMIS design process, in view point of how, what, when and by whom to be performed. (author). 11 refs, 1 fig.

15491 (IAEA–12-SP-384.37, pp. 102-110) **Expert system aided operator's mental activities training.** Gieci, A. (Nuclear Power Plants Research Inst., Trnava (Slovakia)); Macko, J.; Mosny, J.; Gese, A. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

The operator's mental activity is the most important part of his work. A processing of a large amount of the information by the operator is possible only if he/she possesses appropriate cognitive skills. To facilitate the novice's acquisition of the experienced operator's cognitive skills of the decision-making process a special type of the expert system was developed. The cognitive engineering's models and problem-solving methodology constitutes the basis of this expert system. The article gives an account of the prototype of the mentioned expert system developed to aid the whole mental activity of the nuclear power plant operator during his decision-making process. (author). 6 refs, 6 figs.

15492 (IAEA–12-SP-384.37, pp. 111-120) **Human factor in development and implementation of a computerized operator support system (COSS) at an operating power unit of the Novovoronezh NPP.** Scorodoumov, V.A. In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

Basing on an actually existing standard procedure of implementation of any technical idea, a concept of an associated "human factor" chain is introduced in this paper. Each element of the chain is discussed in detail, in terms of problems encountered and practical ways of their elimination. Specific examples are given of problems arising and methods adopted for their solution, one of them being establishing working groups, consisting of experts from mutually complementing areas (e.g. programmers and process engineers), development of a common acceptable "communication language" for the working group, application of a "deep feedback" method between software designers and user-process engineers over the entire process of COSS development and stage-by-stage introduction. 2 figs.

15493 (IAEA–12-SP-384.37, pp. 121-126) **An approach to evaluate task allocation between operators and automation with respect to safety of Nuclear Power Plants.** Macwan, A. (Delft Univ. of Technology, Delft (Netherlands). Lab. for Measurement and Control); Wei, Z.G.; Wieringa, P.A. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

Even though the use of automation is increasing in complex systems, its effect on safety cannot be systematically analyzed using current techniques. Of particular interest is task allocation between operators and automation. In evaluating its effect on safety, a quantitative definition of degree of automation (doA) is used. The definition of doA accounts for the effect of task on safety, irrespective of whether the task is carried out by operator or automation. Also included is the indirect effect due to the change in workload perceived by the operator. This workload is translated into stress which affects operator performance, expressed as human error probability, and subsequently, safety. The approach can be useful for evaluation of existing task allocation schemes as well as in making decisions about task allocation between operators and automation. (author). 13 refs, 1 fig.

15494 (IAEA–12-SP-384.37, pp. 127-132) **Computer managed emergency operating procedures.** Salamun, I. (Ljubljana Univ., Ljubljana (Slovenia). Reactor Engineering Div.); Mavko, B.; Stritar, A. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

New computer technology is a very effective tool for developing a new design of nuclear power plant control room. It allows designer possibility to create a tool for managing with large database of power plant parameters and displaying them in different graphic forms and possibility of automated execution of well known task. The structure of Emergency Operating Procedures (EOP) is very suitable for programming and for creating expert system. The Computerized Emergency Operating Procedures (CEOP) described in this paper can be considered as an upgrading of standard EOP approach. EmDiSY (Emergency Display System - computer code name for CEOP) main purpose is to supply the operator with necessary information, to document all operator actions and to execute well known tasks. It is a function oriented CEOP that gives operator guidance on how to verify the critical safety functions and how to restore and maintain these functions where they are degraded. All knowledge is coded and stored in database files. The knowledge base consists from stepping order for verifying plant parameters, desired values of parameters, conditions for comparison and links between procedures and actions. Graphical shell allows users to read database, to follow instruction and to find out correct task. The desired information is concentrated in one screen and allows users to focus on a task. User is supported in two ways: desired parameter values are displayed on the process picture and automated monitoring critical safety function status trees are all time in progress and available to the user. (author). 4 refs, 4 figs.

15495 (IAEA–12-SP-384.37, pp. 133-144) **Improving CANDU annunciation - Current R and D and future directions.** Lupton, L.R. (AECL Research, Chalk River, ON (Canada). Chalk River Laboratories); Feher, M.P.; Davey, E.C.; Guo, K.Q.; Bhuiyan, S.H. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant

Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

Annunciation is used to ensure that control room staff are promptly alerted to important changes in plant conditions that may impact on safety and production goals. We are carrying out research and development to improve CANDU annunciation, in partnership with Canadian CANDU utility and design organizations. The main goal is to solve the "information overload" problem that occurs during major plant upsets, while providing operators with annunciation information needed to prevent, mitigate, and accommodate plant disturbances. To data, a set of annunciation concepts has been developed based on operational needs in a complex supervisory control environment. A prototype annunciation system has been developed and demonstrated with Point Lepreau Generating Station operations staff. Preliminary evaluations show that the system has the potential to solve many of the current problems associated with upset management. Further evaluation of this system is planned for 1994/95. This paper summarizes the project, including the current status, lessons learned to data, future directions of the research, and implementation by plants. (author). 9 refs, 3 figs, 1 tab.

15496 (IAEA–12-SP-384.37, pp. 145-154) **The development of functional requirement for integrated test facility.** Sim, B.S. (Korea Atomic Energy Research Inst., Taejon (Korea, Republic of). Human Factors Project); Oh, I.S.; Cha, K.H.; Lee, H.C.; Hollnagel, E.; Kontogiannis, T.; Embrey, D.E. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

An Integrated Test Facility (ITF) is a human factors experimental environment comprised of a nuclear power plant function simulator, man-machine interfaces (MMI), human performance recording systems, and signal control and data analysis systems. In this study, we are going to describe how the functional requirements are developed by identification of both the characteristics of generic advanced control rooms and the research topics of world-wide research interest in human factors community. The functional requirements of user interface developed in this paper together with those of the other elements will be used for the design and implementation of the ITF which will serve as the basis for experimental research on a line of human factors topics. (author). 15 refs, 1 fig.

15497 (IAEA–12-SP-384.37, pp. 155-165) **Prototype of an expert system based nuclear power plant information systems.** Vegh, J. (KFKI Atomic Energy Research Inst., Budapest (Hungary)); Bodnar, M.; Buerger, L.; Tanyi, M.; Sefesik, F. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

The components and functioning of the GPCS information system applicable for intelligent process monitoring and alarm generation in a WWER-440 type nuclear power plant are described. The prototype system has been developed by using the G2 expert system, plant measurements were simulated by a WWER-440 compact simulator and by archive replay sessions performed by the VERONA-u core monitoring system. The GPCS contains an object oriented description of the basic subsystems of the plant and concentrates on the fast evaluation/displaying of measurements and alarms. The high-level information reflecting actual plant safety status is synthesized from primary measured data, by forming global alarms and by evaluating logical diagrams. (author). 10 refs, 4 figs.

15498 (IAEA–12-SP-384.37, pp. 166-174) **SACRI: A measure of situation awareness for use in the evaluation of nuclear power plant control room systems providing information about the current process state.** Hogg, D.N. (OECD Halden Reactor Project, Halden (Norway). Man - Machine Interaction Research); Follesoe, K.; Volden, F.S.; Torralba, B. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

Control room operator support systems and their interface designs have as one goal the enhancement of the operators' situation awareness of the dynamically changing process state. This paper describes a technique for measuring situation awareness within the Human Factors evaluation of control room operator-system interfaces. The technique, referred to as SACRI, has been evaluated in four simulator studies and the main findings from these studies are summarized in this paper. It is concluded that SACRI can be a useful supplement to operator performance measures currently existing for use within control room interface evaluations. (author). 16 refs, 2 figs, 3 tabs.

15499 (IAEA–12-SP-384.37, pp. 175-184) **New generation main control room of enhanced safety NPP with MKER reactor.** Golovanev, V.E. (RDIPE, Moscow (Russian Federation)); Gorelov, A.I.; Proshin, V.A. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

Russia is planning to begin the gradual substitution RMBK NPP units, whose resources were worked out itself, to NPP units with a 800 MW multiloop boiling water power reactor (MKER-800) enhanced safety at next ten-year period. Main drawbacks of RBMK Reactor were completely removed in design of MKER-800 reactor. Moreover some special decisions were made to give MKER-800 self-safety properties. The proposed design of the MKER-800 enhanced safety reactor is not only fully free from the drawbacks of the RBMK reactors, but also show a number of advantages of channel-type reactors. This Paper presents some preliminary proposals of MCR Design, that developed Research and Development Institute of Power Energy (RDIPE). 6 refs, 2 figs.

15500 (IAEA–12-SP-384.37, pp. 185-196) **Contribution of qualitative analysis and fuzzy sets to industrial process fault diagnosis: Application to the DIAPASON project.** Montmain, J. (CEA Rhone Valley Research Center - Marcoule, Bagnols-sur-Ceze (France). Applied Computer Science Lab.); Leyval, L. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

The construction of fault indicators is the foundation of model-based fault diagnosis. The development of precise mathematical models for complex facilities is generally difficult and expensive; new and less constraining techniques, notably seeking to account for behaviour, open new perspectives for fault detection and diagnosis. The authors propose a combined approach based on

quantitative processing with qualitative assessment of the results. A veritable numerical-symbolic interface then ensure a more satisfactory balance between the two levels of knowledge - analytic and heuristic - necessary to optimize the performance of a diagnostic procedure. Our supervision support system DIAPASON provides operators of industrial continuous processes with an aid to watch and diagnosis. The reasoning is based on a casual graph and on a knowledge base. After an overview of qualitative simulation, defect diagnosis and fault diagnosis, the way in which these three cooperate in DIAPASON is amplified. (author). 21 refs, 5 figs.

15501 (IAEA–12-SP-384.37, pp. 197-226) **Verification and validation of software related to nuclear power plant control and instrumentation.** Wall, N. (AEA Technology, Winfrith (United Kingdom). Control and Instrumentation Div.); Kossilov, A. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

There has always been significant concern with introduction of software in industry and the nuclear industry is no different from any other sector save its safety demands are some of the most onerous. The problems associated with software have led to the well documented difficulties in the introduction of computer based systems. An important area of concern with software in systems is the processes of Verification and Validation. One of the many activities the IAEA is currently engaged in is the preparation of a document on the process of verification and validation of software. The document follows the safety classification of IEC 1226 but includes software important to plant operation to establish three levels of assurance. The software that might be deployed on a plant was then identified as one of four types: new software, existing software for which full access to the code and documentation is possible, existing software of a proprietary nature and finally configurable software. The document attempts to identify the appropriate methods and tools for conducting the verification and validation processes. (author). 5 refs, 5 figs, 7 tabs.

15502 (IAEA–12-SP-384.37, pp. 227-238) **Enabling technologies and methods for the retro-fitting of AI software into NPPS.** Pymm, P. (Scottish Nuclear, East Kilbride (United Kingdom). Engineering Div.). International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

Scottish Nuclear have a number of plant monitoring and training applications at their operational nuclear power plant which could benefit from the introduction of artificial intelligence (AI) software. An outline of early work on two current AI developments in the areas of advanced operator aids and intelligent training is given. A generic workstation based engineering simulator (WES) which provides a prototyping environment for AI product application development and evaluation and development of human-computer interface (HCI) designs for plant installation is described. It is concluded that the WES architecture facilitates both migration of the prototype AI application to the plant and collaboration in the AI field between Scottish Nuclear and other organizations. (author). 1 ref., 6 figs.

15503 (IAEA–12-SP-384.37, pp. 239-248) **Diagnostic knowledge generation of nuclear power plants using knowledge compilers.** Yoshikawa, Shinji (Development Corp., Narita, Oarai (Japan). Power Reactor and Nuclear Fuel); Endou, Akira; Ikeda, Mitsuru; Mizoguchi, Riichiro. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

This paper discusses a method to generate diagnostic knowledge of nuclear power plants, from commonly accepted physical knowledge and design information about plant configuration. This method is based on qualitative reasoning, which is advantageous to numerical information processing in the sense that system can explain why and how directly applicable knowledge is correctly generated, and that knowledge base is highly reusable and expandable because it is independent on detailed numerical design specifications. However, reasoning ambiguity has been found as the largest problem in applying the technique to nuclear power plants. The proposed approach mainly consists of a knowledge representation scheme, reasoning algorithm, and qualitative model construction method. (author). 4 refs, 8 figs, 1 tab.

15504 (IAEA–12-SP-384.37, pp. 249-259) **Applications of autoassociative neural networks for signal validation in accident management.** Fantoni, P. (Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt); Mazzola, A. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. (CONF-9409318–: Specialists' Meeting on Advanced Information Methods and Artificial Intelligence in Nuclear Power Plant Control Rooms, Halden (Norway), 13-15 Sep 1994). In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

The OECD Halden Reactor Project has been working for several years with computer based systems for determination on plant status including early fault detection and signal validation. The method here presented explores the possibility to use a neural network approach to validate important process signals during normal and abnormal plant conditions. In BWR plants, signal validation has two important applications: reliable thermal limits calculation and reliable inputs to other computerized systems that support the operator during accident scenarious. This work shows how a properly trained autoassociative neural network can promptly detect faulty process signal measurements and produce a best estimate of the actual process value. Noise has been artificially added to the input to evaluate the network ability to respond in a very low signal to noise ratio environment. Training and test datasets have been simulated by the real time transient simulator code APROS. Future development addresses the validation of the model through the use of real data from the plant. (author). 5 refs, 17 figs.

15505 (IAEA–12-SP-384.37, pp. 260-269) **The role of the artificial intelligence within the context of the human factors in the nuclear safety.** Bayout Alvarenga, M.A. (Comissao Nacional de Energia Nuclear (CNEN), Rio de Janeiro, RJ (Brazil)). International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

The effective evaluation of a human-machine system depends heavily on a cognitive model of the human behaviour. The basic question is: How can we model the human cognition? The response should be found in the five disciplines that form the Cognitive Sciences: Artificial Intelligence, Cognitive Psychology, Neurophysiology, Linguistic, and Philosophy. Among them, the Artificial Intelligence appears as the catalyzer of the contributions and discoveries in the other four, trying to realize that cognitive model with the tools of the Computer Science. Sometimes, it seems as if

these disciplines spoke different languages to describe the same ideas. It is necessary a holistic treatment of such questions that include the human cognition and its modelling. This becomes more clear when we observe that there are nowadays different methodologies that must be integrated in some way. This is the case of the symbolic approach (artificial intelligence), connectionist approach (neural networks) and the fuzzy logic. This paper makes a review of the available methodologies, showing the problems and the current solutions to answer the following question. How is possible to develop a human-machine system and an intelligent interface based on the Artificial Intelligence that fulfills the following characteristics: human-centered design, cognitive simulation of the human behaviour, and dynamic function allocation. This paper concludes with proposals of national projects to be applied to the Brazilian situation. (author). 28 refs.

15506 (IAEA–12-SP-384.37, pp. 270-277) **Evaluation of human fitness for duty in a real working situation.** Skof, M.M. (University Medical Centre Ljubljana, Ljubljana (Slovenia). Inst. of Occupational, Traffic and Sports Medicine); Molan, G. International Atomic Energy Agency, Vienna (Austria); Institutt for Energiteknikk, Halden (Norway). OECD Halden Reaktor Projekt. 1994. In *Proceedings of the International Atomic Energy Agency specialists' meeting on advanced information methods and artificial intelligence in nuclear power plant control rooms.* 301p. Order Number DE95627981. Source: OSTI; NTIS (US Sales Only); INIS.

According to the results of root causes analyzes in the complex highly atomized systems almost 80% of reported events and scrams are due to the human error or malfunction. Nowadays scrams are mostly consequences of human mistakes. Human mistakes are according to the results of root cause analyses consequences of unfitness or inability to perform demanded task. Most of the workers in the system have adequate psychophysiological abilities and basic knowledge. So their performance in a real working situation depends on their fitness for duty or actual availability. Actual availability and consequently human performance depends on: Human abilities (basic human traits); human knowledge (knowledge received in education process and in special training); human motivation (willingness to take part in the activity). Actual availability is the interference of abilities, knowledge and motivation in the real situation and it shapes human performance. Workers are able to self estimate their fitness for duty. On these estimations modelling of human performance in a real situation is possible. By the level of human performance system's performance should be predicted. We have developed questionnaire VTP for self estimations of wellbeing, mood, fatigue, arousal level, stress and motivation. At the same time data indicating human performance have been collected. Indicators of human performance have been the results on dual task and effectiveness in primary task. Connections between human fitness for duty and human performance have been modelled. Developed model explain the impacts of particular factors of fitness for duty on systems performance. (author). 5 refs, 1 tab.

15507 (IAEA-IWG-NPPCI–92/2) **Nuclear power plant control and instrumentation 1991. Working material. Proceedings of the regular meeting held in Vienna, 6-8 May 1991.** International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1992. 109p. (CONF-9105457–: Meeting of the International Working Group on nuclear power plant control and instrumentation, Vienna (Austria), 6-8 May 1991). Order Number DE95627978. Source: OSTI; NTIS (US Sales Only); INIS.

The meeting of the IWG-NPPCI was organized in order to summarize operating experience of nuclear power plant control systems, gain a general overview of activities in development of modern control systems and receive recommendations on the further directions and particular measures within the Agency's programme. The meeting was held at the IAEA Headquarters in Vienna and was attended by twenty four national delegates and observers from 19 countries. The present volume contains: report on the meeting of the IWG-NPPCI, Vienna, 6 to 8 May 1991; report of the scientific secretary on th major activities of IAEA during 1989-91 in the NPPCI area; and reports of the national representatives to the International Working Group on NPPCI. The papers and discussions with practical experience and described actual problems encountered. Emphasis was placed on technical, industrial and economic aspects of the introduction of modern control systems and on the improvement of plant availability and safety. Refs, figs and tabs.

A brief resume of the activities in the different areas of control and instrumentation is included. As there was a delay in the construction of the new power plant most of the effort were dedicated to the plants that they are in operation. It has been added instrumentation to have better information in the control room and to check new variables of the plant according with the experience learned from the operation. It was dedicated special strength in the areas of training simulators and in service inspection. (author).

More than 60% of the electricity production in Belgium is covered by nuclear PWR plants. As no commissioning of new NPP'S is expected in the next years, the electricity equipment plant foresees installation of some additional 2000 MWE conventional producing capacity (coal and gas) until 1995. The main nuclear I and C activities in Belgium are related with improvement of: the safety of existing plants; the operation of existing plants; the training of operators; the waste storage facilities. (author). 3 figs.

Shortly, Canada will have an installed nuclear capacity of 15,500 MWe. The 4 unit Darlington Nuclear Generating Station, which makes extensive use of computers for control and safety shutdown, is currently being connected to the Ontario Hydro grid. A significant effort is underway on technologies that will enhance the human-machine interface to meet more stringent plant availability and safety goals. This includes work on alarm annunciation, distributed control, plant display, relay logic replacement and software technology. These various initiatives and their benefits are discussed in the paper. (author). 6 refs.

The report presents a review of Czechoslovak nuclear power plants that are in operation and in the course of construction. The present state of the instrumentation of the newly built NPP's is described, and a special attention is given to work on the control of spatial power distribution in the reactor core of WWER 1000, the first unit to be installed in NPP Temelin. A project of a secondary circuit diagnostic system of this unit is described. (author). 6 refs, 1 tab.

Source: OSTI; NTIS (US Sales Only); INIS.

Finland has remarkable achievements in nuclear power. The existing four plants have some of the best operating records in the world - high capacity factors, low occupational doses and short refuelling outages. Public opinion was strongly turned against nuclear power after Chernobyl accident, and the previous government decided not to allow for the construction of a fifth nuclear unit during its period of reign. The opposition has however slowly been diminishing. According to the latest polls the opinion is almost balanced. Finnish power companies are going to file an application for a decision-in-principle to build a new plant to the new government appointed in April 1991. A readiness to start new construction project immediately after a positive political decision is made has been maintained during the intermediate period. Continuous research, development, modification and upgrading work provide important components of the good operational history of the Finnish nuclear power plants. Efforts have also been devoted to identifying possible new problems arising from the use of distributed digital C and I technology. The following a short description is summarizing recent activities related to the C and I-systems of the nuclear power plants. (author). 3 tab.

Source: OSTI; NTIS (US Sales Only); INIS.

A considerable percentage (32.8% in 1989) of electric energy in Hungary is produced by nuclear power plant Paks. The paper presents an overview of activities on control and instrumentation in the following areas: Control and instrumentation upgrading; training simulators; diagnostic systems. (author). 1 tab.

15516 (IAEA-IWG-NPPCI–92/2, pp. 58-60) **Nuclear power plant control and instrumentation in Italy.** Lantieri, A. (ENEA, Bologna (Italy). Dipt. Reattori Innovativi). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1992. The National Energy Plan (PEN) approved by the Government of Italy in August 1988 provides a programme of research and industrial development or reactors with inherent and passive safety features. For the Control Systems and Instrumentation there is the aim to define rules and design criteria, by evaluating the impact of inherent safety goals on the C and I design. The effort on man-machine interface is considered essential to increase safety and efficiency of advanced reactors. The paper briefly describes the activity in control systems and in the instrumentation area. (author).

15517 (IAEA-IWG-NPPCI–92/2, pp. 60-67) **Recent development of nuclear power in Japan and instrumentation and control system and control room equipment for advanced light water reactors.** Wakayama, N. (Japan Atomic Energy Research Inst., Tokai, Ibaraki (Japan). Tokai Research Establishment). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1992. (CONF-9105457–: Meeting of the International Working Group on nuclear power plant control and instrumentation, Vienna (Austria), 6-8 May 1991). In *Nuclear power plant control and instrumentation 1991. Working material. Proceedings of the regular meeting held in Vienna, 6-8 May 1991.* 109p. Order Number DE95627978. Source: OSTI; NTIS (US Sales Only); INIS.

This paper was provided for the 13th IAEA/IWG-NPPCI Meeting and aims to introduce an outline of recent development of nuclear power in Japan and some topics in the field of nuclear power plant control and instrumentation. Forty units of nuclear power plants are in operation in Japan and five units of BWRs and six PWRs are under construction. Construction of prototype FBR Monju have almost completed an construction of High-Temperature Engineering Test Reactor, HTTR, started in March 1991. In parallel of those, extensive effort has been carried out to develop the third generation

LWRs which are called Advanced BWR (ABWR) and Advanced PWR (APWR). Two Advanced BWRs are under safety review for construction. Instrumentation and control system of these Advanced LWRs adopts integrated digital I and C system, optical multiplexing signal transmission, fault tolerant control systems and software logic for reactor protection and safety systems and enhances plant control performance and provides human-friendly operation and maintenance environments. Main control room of these Advanced LWRs, comprised with large display panels and advanced console, has special futures such as one-man sit-down operation, human friendly man-machine interface, high level automation in operation and maintenance. (author). 7 refs, 9 figs, 1 tab.

In *Nuclear power plant control and instrumentation 1991. Working material. Proceedings of the regular meeting held in Vienna, 6-8 May 1991.* 109p. Order Number DE95627978. Source: OSTI; NTIS (US Sales Only); INIS.

This article has been prepared for the regular IAEA/IWG-NPPCI-meeting in May 1991. It provides an outline of the status of and prospects for nuclear energy in the Netherlands and a brief description of topics given specific attention by the authorities. It also gives an overview of recent developments and aims related to I and C in nuclear power stations. (author).

15519 (IAEA-IWG-NPPCI–92/2, pp. 69-70) **Activities in the field of nuclear reactor instrumentation and control in Poland - 1991 status.** Mikulski, A.T. (Institute of Atomic Energy, Otwock-Swierk (Poland)). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1992. (CONF-9105457–: Meeting of the International Working Group on nuclear power plant control and instrumentation, Vienna (Austria), 6-8 May 1991). In *Nuclear power plant control and instrumentation 1991. Working material. Proceedings of the regular meeting held in Vienna, 6-8 May 1991.* 109p. Order Number DE95627978. Source: OSTI; NTIS (US Sales Only); INIS.

The report gives a condensed overview of activity in the field of nuclear reactor instrumentation and control in Poland over the last few years. The work was performed parallel in two directions related to the construction of the first Nuclear Power Plant at Zarnowiec and to the changes made for two research reactors at Swierk. The first direction, according to government decision, was cancelled at the end of 1990 and the results obtained up to now are briefly summarized. The second one is in progress, some minor changes in I and C for the EWA reactor and significant improvements for the MARIA reactor are under way. The results of this activity are presented. (author). 6 refs.

15520 (IAEA-IWG-NPPCI–92/2, pp. 71-75) **Nuclear power plant control and instrumentation activities in Spain.** Blasco, J. (Consejo de Seguridad Nuclear, Madrid (Spain)). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1992. In *Nuclear power plant control and instrumentation 1991. Working material. Proceedings of the regular meeting held in Vienna, 6-8 May 1991.* 109p. Order Number DE95627978. Source: OSTI; NTIS (US Sales Only); INIS.

The paper summarizes the principal activities in the field of Nuclear Power Plants Control and Instrumentation in Spain. The following activities are briefly described: Post-Accident Instrumentation; Safety Parameter Display System; Control Room Design Review; ATWS Mitigation System Actuation Circuit; Modifications at the Oldest Plants. (author). 2 tabs.

15521 (IAEA-IWG-NPPCI–92/2, pp. 75-79) **Report on the status of instrumentation and control in Swedish nuclear power plants.** Stroebeck, E. (Swedish State Power Board, Vaeroebacka, (Sweden). Ringhals Nuclear Power Plant). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1992. (CONF-9105457–: Meeting of the International Working Group on nuclear power plant control and instrumentation, Vienna (Austria), 6-8 May 1991). In *Nuclear power plant control and instrumentation 1991. Working material. Proceedings of the regular meeting held in Vienna, 6-8 May 1991.* 109p. Order Number DE95627978. Source: OSTI; NTIS (US Sales Only); INIS.

Nuclear power plants accounted for 46% of the total electric power production in Sweden in 1990. The availability of the Swedish reactors remains at a very high level. The oldest Swedish nuclear power plant has been in operation for nearly 20 years, and in the next 5 to 10 years a large portion of the NPP electrical equipment has to be replaced. The paper presents an overview of activities on control and instrumentation in the following: Future developments; implementation of computer-based systems; training simulators; nuclear safety research. The operating experience in Swedish nuclear power plants in 1991 is also presented. (author).

15522 (IAEA-IWG-NPPCI–92/2, pp. 80-82) **Nuclear power plant control and instrumentation in Switzerland.** Voumard, A. (Swiss Federal Nuclear Safety Inspectorate, Wuerenlingen (Switzerland). In Switzerland five NPPs are in operation and none is planned or is under construction. The three oldest NPPs are backfitted with an additional safety system. In the field of I and C, efforts are essentially directed to maintaining high performance and to improve the safety of the plants in operation. Three of these plants are about 20 years old and a significant part of their I and C equipment has to be replaced. This is an ongoing process which is carried out stage by stage mostly during the annual shutdown. Measures to avoid or mitigate severe accidents, including core melting, have been taken or are planned. (author). 1 tab.

15523 (IAEA-IWG-NPPCI–92/2, pp. 82-87) **National report on nuclear power plant control and instrumentation in the United Kingdom.** Goodings, A. (AEA Technology, Dorchester, Dorset (United Kingdom). Sensors and Instrumentation Dept.). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1992. (CONF-9105457–: Meeting of the International Working Group on nuclear power plant control and instrumentation, Vienna (Austria), 6-8 May 1991). In *Nuclear power plant control and instrumentation 1991. Working material. Proceedings of the regular meeting held in Vienna, 6-8 May 1991.* 109p. Order Number DE95627978. Source: OSTI; NTIS (US Sales Only); INIS.

This paper notes that, although no fundamental, NPPC and I technical developments have taken place in the UK since 1989, enormous organizational changes have occurred. The influence of these changes on instrumentation capability is discussed and the current situations on the Magnox, AGR and Fast Reactors and on the Sizewell PWR are described. Work on pulse-coded-logic reactor trip systems based on conventional microprocessor components is noted and a new, Dungeness B AGR, single channel trip systems which uses these principles is described. Other developments in sensors, instrumentation, ultrasonics and under-sodium viewing are also described as are studies on software reliability, human factors engineering and related topics. Comments are made on general aspects of computers in reactor safety systems. It is concluded that the last two years have seen considerable progress in the UK despite the interruptions and problems generated by organizational changes. It is felt that these changes may have produced a new sense of urgency and better insights into the needs of the industry. (author). 2 refs.

15524 (IAEA-IWG-NPPCI–92/2, pp. 87-95) **Development of monitoring, control and protection systems of nuclear power reactors in the USSR: Status and trends.** Kondrat'ev, V.V. (Research and Development Inst. of Power Engineering, Moscow (Russian Federation)); Mikhailov, M.N.; Prozorov, V.K.; Chudin, A.G. International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1992. (CONF-9105457–: Meeting of the International Working Group on nuclear power plant control and instrumentation, Vienna (Austria), 6-8 May 1991). In *Nuclear power plant control and instrumentation 1991. Working material. Proceedings of the regular meeting held in Vienna, 6-8 May 1991.* 109p. Order Number DE95627978. Source: OSTI; NTIS (US Sales Only); INIS.

In 1989-90 the Supervision Body approved the new safety regulations for nuclear power plants. The operating plants do not always completely satisfy them and a great amount of work to develop operating power units up to the conditions required is necessary. This paper describes briefly the main changes made in monitoring, control and protection systems of nuclear power reactors to increase the reactor safety. The following fields are presented in the paper: General status of the NPP control and safety systems and instrumentation in USSR; sensors; electronic equipment; actuators improvement; qualification tests. (author). 3 figs.

15525 (IAEA-IWG-NPPCI–92/2, pp. 95-98) **Report on nuclear power plant instrumentation and control in Germany.** Bastl, W. (Gesellschaft fuer Reaktorsicherheit mbH (GRS), Garching (Germany)). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1992. (CONF-9105457–: Meeting of the International Working Group on nuclear power plant control and instrumentation, Vienna (Austria), 6-8 May 1991). In *Nuclear power plant control and instrumentation 1991. Working material. Proceedings of the regular meeting held in Vienna, 6-8 May 1991.* 109p. Order Number DE95627978. Source: OSTI; NTIS (US Sales Only); INIS.

The paper describes the status of the NPP control and instrumentation in Germany. The general technology underlying most aspects of NPP C and I in Germany has not altered since the last progress report although there has been many improvements in detail. Since the beginning of 1990 the GRS carried out the safety investigations of NPPs in East Germany. The USSR as the vendor of the plants and France were also involved in the project. The following fields are briefly described: Status of nuclear power in Germany; training simulators; backfitting of computers and information systems; operator support/new control rooms. (author). 6 refs, 1 tab.

15526 (IAEA-IWG-NPPCI–92/2, pp. 98-106) **General overview of recent developments and future prospects for instrumentation and control activities in France.** Furet, J. International Working Group on Nuclear Power Plant Control and Instrumentation. 1992. (CONF-9105457–: Meeting of the International Working Group on nuclear power plant control and instrumentation, Vienna (Austria), 6-8 May 1991). In *Nuclear power plant control and instrumentation 1991. Working material. Proceedings of the regular meeting held in Vienna, 6-8 May 1991.* 109p. Order Number DE95627978. Source: OSTI; NTIS (US Sales Only); INIS.

Status of the NPP program development is recalled. The result of operational experience in 1990 is given. About 75% of electrical energy production was furnished by NPP. The main lines of the R and D program concerning future PWR and European Fast Breeder project are recalled. The latest achievements in design and I and C concern: IN CORE and EX CORE neutrons detectors for PWR high temperature neutrons detector for EFR - Test results in hard environment of new Instrumentation hardware in PWR containment building - new control and safety algorithms for future PWR safety and control systems. The effort on "Verification and Validation" of real time software is based on the use of an efficient tool. (author).

15527 (IAEA-IWG-NPPCI–93/1) **Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.** International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. 322p. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

With a view to exchanging information on most recent development of technology in the field the IAEA International Working Group on Nuclear Power Plant control and Instrumentation suggested to organize a Specialists' Meeting on "Operating Procedures for Nuclear Power Plants and their Presentation". The meeting was held in Vienna, at IAEA Headquarters from March 31 to April 2, 1992 and provided an opportunity to: share operators experience; discuss the different techniques of presenting the information; identify further trends of technology and needs of the industry. The meeting was attended by 46 participants representing 12 Member States and 3 international organizations. The present volume contains summary of the meeting, session summaries and papers of the national participants. Refs, figs and tabs.

15528 (IAEA-IWG-NPPCI–93/1, pp. 19-39) **Situation for plant procedures among the members of the WANO-Paris Centre.** Hoensch, V. (World Association of Nuclear Operators, Paris (France)). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

The paper discusses results of a workshop on "Development and Qualification of Plant Procedures" performed by the WANO-Paris Centre, Germany, March 12-14, 1991. 1 ref., 13 figs.

15529 (IAEA-IWG-NPPCI–93/1, pp. 41-56) **Operating and training technical documentation production and management system.** Abercrombie, S. (Ontario Hydro, Tiverton, ON (Canada). Bruce Nuclear Generating Station 'B'). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

Bruce Nuclear Generating Station 'B' (BNGS 'B') consists of 4 Pressurized Heavy Water Reactors each with a maximum continuous rating of 930 MW. The station, located on the shore of Lake Huron in Ontario Canada, is part of Ontario Hydro's Bruce Nuclear Power Development. System Operating Manuals specify the actions that must be taken to safely operate the plant systems during specified standard, non-standard and abnormal operating conditions. This paper outlines the current project of rewriting and maintaining the plant system operating and training manuals. The principle goals are to make the new manuals: (a) Current; (b) Technically accurate; (c) User friendly; (d) Easy to revise. The paper looks at the rationale and justification for the project. All phases of the documentation process are explored. Each area examined will draw out the advantages and benefits over the previous system. The creation of a new Overall Unit Operating Manual will be reviewed highlighting it's beneficial contribution to plant operations. (author). 2 figs, 2 tabs.

15530 (IAEA-IWG-NPPCI–93/1, pp. 57-65) **Brief summary of incident reporting system events with procedural deficiencies.** Tolstykh, V. (International Atomic Energy Agency, Vienna (Austria). Div. of Nuclear Safety). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992. 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

Since 1983 the Agency has been gathering information on NPP unusual events considered important for safety and accident prevention. The more than a thousand unusual events in the Incident Reporting System (IRS) contain considerably more lessons learned for the international operational experience feedback process. This summary of IRS recent events gives information on procedural failure (no single person is responsible for the accuracy of a procedure, the production of procedure is multifaceted). Emphasis in the IRS event patterns analysis was given to two aspects: Incomplete procedure (usually an equipment failure initiates a transient, and then the corresponding procedures failed to provide enough information); incorrect procedure (as with incomplete procedure, this problem usually occurs when trying to respond to a plant transient). (author). 2 tabs.

Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

Based on the present used philosophy in Canada and in Atucha Nuclear Generating Station (Argentina) it was decided to develop the Abnormal Event Procedures (EOP's) in a logical diagram format. The EOP's have in general two parts: the diagnosis and the operative action to mitigate the event. Some serious incidents can be resolved by the EOP's, but the philosophy is first, to satisfy the EOP's requirements. Taking into account the operating experience, the Final Safety Report and the results of simulations done by appropriate codes, it was possible to obtain the corresponding sequence for each abnormal event. With the information available in the Control Room (windows, alarms, trends, etc) for each part of the EOP's was associated the instrumentation that the operator must observe. 3 figs.

15533 (IAEA-IWG-NPPCI–93/1, pp. 97-107) **The plant operating procedure information modeling system for developing human-factored emergency procedures.** Fanto, S.V. (Westinghouse Electric Corp., Pittsburgh, PA (United States). Nuclear and Advanced Technology Div.); Petras, D.S.; Reiner, R.T.; Bastien, R.; Orendi, R.G.; Aheimer, G.A. International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

As a result of the accident at Three Mil Island, regulatory requirements were issued to upgrade Emergency Operating Procedures (EOPs) for nuclear power plants. The use of human-factored, function-oriented, EOPs were mandated to improve human reliability and to mitigate the consequences of a broad range of initiating events, subsequent failures and operator errors, without having to first diagnose the specific events. The Westinghouse Owners Group (WOG) responded by developing Emergency Response Guidelines (ERGs) in a human-factored, two-column format to aid in the transfer of the improved technical information to the operator during transients and accidents (i.e., periods of high stress). The Emergency Response Guidelines are a network of 43 interrelated guidelines which specify operator actions to be taken during plant emergencies to restore the plant to a safe and stable condition. Each utility then customizes these two-column format ERGs to produce plant specific EOPs. Since the creation and maintenance of this large web of interconnecting EOPs is an extremely complex task, a computerized system was developed to address the administrative and regulatory requirements for maintaining the EOPs and the associated supporting documentation. The Plant Operating Procedure Information Modeling (POPIM) system was developed to provide procedure documentation specialists with a controlled, database-driven means to build and maintain human-factored procedures and their supporting documentation. The POPIM system is a software package which integrates off-the-shelf word processing, database management, and optical scanning microcomputer software, resulting in a menu-driven computerized tool that aids the procedure documentation specialist in this time-consuming and tedious effort. 1 fig.

15534 (IAEA-IWG-NPPCI–93/1, pp. 109-121) **The new modular emergency procedure concept for SIEMENS PWRs.** Mueller, R.E. (Siemens AG Unternehmensbereich KWU, Erlangen (Germany)); Moser, H.J.; Roth-Seefrid, H. International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

The new modular procedure concept which is being implemented in German PWRs meets the increasing requirements on clarity, manageability and human factors optimization while keeping the efforts involved in updating, reproduction and storage on an acceptable level. The concept uses three levels of detail for presenting the required information: strategy chart with automatic and manual action modules, resolution of action modules into individual actions and background information, resolution of individual actions into detailed step programs. The procedures are written with the aid of an electronic publishing software that runs on multiple platforms such as Unix work stations, MS-DOS Pcs and Macintosh computers. To facilitate the generation of new procedures the action modules will be stored in a relational databank containing all relevant plant specific information. Verification of thermalhydraulic plant behaviour is done by computer simulation at the time of development. Use of the plant analyzer developed by SIEMENS is envisaged. Final man-machine interface validation is done by full scope simulators during training sessions of reactor operators. Future development will be directed to combine the event-oriented and the safety-function oriented approaches to a fully harmonized concept and to integrate the new modular procedures format into the computerized control room of the cockpit type being developed by SIEMENS. (author). 3 refs, 4 figs.

15535 (IAEA-IWG-NPPCI–93/1, pp. 123-129) **Principals and development strategies for procedures with a focus on abnormal situations.** Engqvist, A. (Vattenfall AB, Vaellingby (Sweden)); Lehto, T.; Jansson, B. International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their

presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

The nuclear industry use procedures to provide that different tasks are performed in a controlled way. Procedures are used in normal and abnormal situations, and are supposed to support the operators as much as possible in different sequences. But also the management level needs guidance in incident situations to support decision making. There must, for example, be a procedure for a change in the operation mode of the feed-water system, when the demand is to perform correctly without mistakes rather than performing within time limits, as well as procedures for complex incident sequences, when the demand is to perform within given time limits in a acceptable way. This paper describes the Vattenfall Forsmarksverket approach to solve the procedure complex. Forsmarksverket is a BWR-site with three plants of the ABB Atom advanced reactor design with internal circulation pumps. Two of the plants are twins with a net electrical output of 1000 MW each, they were taken in commercial operation in 1980 and 1981, and the third plant is a 1200 MW net electrical output plant in commercial operation in 1985. (author). 2 figs.

15536 (IAEA-IWG-NPPCI–93/1, pp. 137-153) **The development of the operating procedures for Sizewell 'B' PWR.** McIntyre, P.J. (Nuclear Electric plc, Knutsford (United Kingdom). PWR Project Group). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

In order to operate a power station safely and efficiently the operating staff requires direction from the designers both of the plant and of the administrative systems within which the station must be operated. This direction is provided in written form via operational documentation. At Sizewell 'B', a 4-loop Westinghouse based PWR power station, due to raise power during 1994, an extensive programme of work is being undertaken to provide a highly useable set of procedures for operation of the station. This programme has been built on Nuclear Electric's experience on its gas-cooled reactor power stations and on PWR operational experience worldwide. This paper briefly describes the structure of the operating procedures at Sizewell 'B' and the approach taken to ensure a consistent and high quality presentation to the user. The paper describes in more detail the development of the control room procedures and focuses particularly on their presentation to the operator, verification and validation, and the interrelationship with Man-Machine Interface, staffing and training development. The quality assurance programme for nuclear power plant operation provides an interdisciplinary approach to all activities affecting quality. The quality assurance programme documentation includes various types of procedures. Programmatic procedures represent administrative tools for directing the total effort in a planned and systematic manner. Work-oriented procedures are used to perform and control work processes. As appropriate, the format and content of procedures should be standardized. Each procedure is reviewed and approved, prior to initial use. Temporary procedures are subject to the same review, approval and verification processes as normal procedures. The plant management has the main responsibility to ensure and verify that the operating procedures are effectively implemented. Verification of implementation of procedures includes techniques such as surveillance of activities, examination of records, interview of personnel and audits. 6 refs.

15538 (IAEA-IWG-NPPCI–93/1, pp. 163-175) **Procedures development: Common deficiencies and possible solutions.** Grenn, M. Procedures, particularly emergency operating procedures (EOPs), are an important method of operator support and one which appears to be particularly vulnerable to problems. Any deficiencies in this area are likely to result in reduced human reliability and hence lead to a lower level of overall system reliability and availability. This paper outlines recent research carried out for the IAEA, aimed at identifying and evaluating the factors affecting procedural support in emergencies and abnormal incidents. These factors have been developed into a comprehensive classification scheme of procedural deficiencies. This classification scheme was based on findings from literature reviews, interviews with NPP personnel responsible for EOP development, and assessment of the effectiveness of procedures during a number of documented NPP incidents. The resultant classification scheme goes beyond identifying deficiencies which manifest themselves in the procedures (e.g. technical inaccuracies and incompleteness), to more detailed areas pertinent to the procedures development life cycle and its relationship to training. It is proposed that deficiencies within these areas are the cause of many of the problems which appear in procedures. It is these 'root causes' which must be addressed if procedures are to provide an effective means of operator support. Further analysis of incidents using the above classification scheme identified weaknesses in current incident reporting systems which prevent effective identification of, and therefore solutions to, these more fundamental deficiencies. (author). 14 refs, 2 figs.

15539 (IAEA-IWG-NPPCI–93/1, pp. 177-188) **The computerised procedure system COPMA-II.** Teigen, J. (OECD Halden Reactor Project, Halden (Norway). Inst. for Energiteknikk); Ness, E. International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

COPMA (Computerised OPeration MAnuals) is a computerised procedure following system developed at the OECD Halden Reactor Project. The first version of the COPMA system became operational in 1989. Based on the experiences made with the first version we are now developing a second version; COPMA-II. The COPMA-II system will consist of three main components as described in this paper: (1) A procedure editor used by the procedure writer for entering and editing procedures written in a dedicated procedure language. (2) A procedure database containing the procedures generated by use of the procedure editor. (3) The COPMA-II On-line system which is intended to assist process operators in retrieving and executing procedures. The On-line system may be connected to the process computer so that COPMA may automatically read the values of process parameters referred in the procedures. These values can be used by COPMA to automatically determine the correct flow of control in the procedure based on the current state of the plant (as specified by the procedure writer).

COPMA may also support continuous monitoring of process conditions and provide the operator with a notification when some condition monitored becomes fulfilled. By use of the on-line connection to the process computer, the operator may initiate manipulations of process components from the On-line system. COPMA-II will be available on general purpose Unix workstations. Both the procedure editor and the COPMA-II On-line system are designed as window-oriented applications based on X-Windows and with man-machine interfaces composed of components adhering to the OSF/Motif standard for look and feel. 15540 (IAEA-IWG-NPPCI–93/1, pp. 189-202) **The application of symptom-based operating procedures to UK gas-cooled reactors.** Jenkinson, J. (Nuclear Electric plc, Barnwood (United Kingdom). Human Factors Section). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

The use of symptom-based procedures has now become well established on water reactor plants throughout the world. As part of a programme of enhancements to magnox and Advanced Gas-Cooled Reactor plants Nuclear Electric in the UK is developing fault management procedures based on the critical safety function approach which will be known as Symptom-Based Emergency Response Guidelines. Current initiatives are examining the role of operators in abnormal situations and the provision of additional operator support to enhance operator performance in Beyond Design Basis faults. Operating procedures have for too long been 'allowed to happen' as part of an overall design approach. This is no longer defensible. Operating procedures should be 'designed', against specific acceptability criteria, in the same way as any other part of the operator interface as part of a structured approach to interface design. Using an initial pilot SBERG a structured evaluation was carried out, involving operating staff from one shift at the pilot plant. A documentation package was produced consisting of introductory material to explain the nature of the trial, the SBERG Entry Checklist, the pilot SBERG, and a user questionnaire. This paper outlines the work being carried out and discusses certain human factors issues which arise from the evaluation results. The work has brought to light a number of issues concerning procedure design, together with user and usability criteria. Initial assumptions about the nature of suitable advice to support operators in beyond-design basis situations have been justified and the work indicates ways in which the pilot product can be improved and enhanced. The work provides a basis for a programme cover the provision of SBERGs for a number of Magnox and Advanced Gas-Cooled plants. (author). 3 refs, 3 figs, 5 tabs.

15541 (IAEA-IWG-NPPCI–93/1, pp. 203-209) **Computerized system for procedures execution monitoring.** Lipner, M.H. (Westinghouse Electric Corp., Pittsburgh, PA (United States)); Pitcairn, F.S.; Bastien, R. International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

To assist plant operations personnel in assessing the overall status of the plant in both normal and emergency conditions, a CRT-based Computerized Procedures system, COMPRO, was developed. COMPRO utilizes the written procedures as the basis for textual displays and prompts which guide the operator through the procedures and at the same time provide parallel information about relevant plant parameters. By presenting this information in parallel the operator always sees where he is in the context of the overall plant response. The purpose of the system is (1) to guide the user step by step through the procedures by monitoring the appropriate plant data, by processing the data and by identifying the recommended course of action and (2) to provide the necessary parallel information which allows the user to assess other plant conditions which may require attention. The COMPRO system makes use of prompts which are clear and understandable. Any cursor control device may be used for user input to the system. A powerful relational data base management system (RDBMS) is embedded within COMPRO. A relational data base consists of a series of tables which are logically interrelated. A relational data base management system is a software system which facilitates the management of these tables. A RDBMS automatically provides the functions of (1) accepting data and instructions from users, (2) retrieving information from the data base, (3) updating the data base and (4) formatting and outputting data to users. COMPRO uses the data base to store all the data required to generate a procedure. Since this data exists external to the COMPRO software, changes can be made to the data without requiring manual changes to the software code. (author). 1 fig.

15542 (IAEA-IWG-NPPCI–93/1, pp. 211-240) **Operating procedures and maintenance documentation presentation for a NPP control room personnel.** Buchstab, Y.A. (Institute of Application Mathematics of Russian Academy of Sciences, Moscow (Russian Federation). Research and Development Inst. of Power Engineering); Michailov, M.N.; Sazonov, N.A. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

System of operating procedures and maintenance documentation presentation to NPP unit operating personnel (system "HYD") is considered in the paper. This system is developed on the base of a hypertext computer technology. Data of documentation volume on unit operating personnel working places and manner of its utilization are presented. "HYD" principles of operation are considered. Stages of the system installation at Leningrad NPP and current state of design are described. (author). 7 figs, 3 tabs.

15543 (IAEA-IWG-NPPCI–93/1, pp. 241-253) **A methodology for determining the optimal procedure basis for nuclear power plant operation.** Bardsley, A.S. (SRD, AEA Technology, Culcheth (United Kingdom)). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

Due to the complex nature of Nuclear Power Plant operations several different approaches to procedure structure, and content have been developed. This paper presents a methodology for basing the decision of procedure format selection on a more rational basis. Several operating scenarios are used and the methodology is applied to these; determining the procedure format based on the type of tasks performed. There are different formats on which to base procedures. This basis depends on the cognitive demands placed on the operator by the procedures. The types of procedure looked at are event-based procedures, where the operator must diagnose the event before the procedure is selected, and state-based procedures where the operator needs to identify the plant state to be reached, without needing to identify the particular event. This paper describes eleven factors based on features of Nuclear Power Plants which are used to determine attributes for the types of tasks to which the methodology is applied. By matching the task attributes to the needs of the procedural basis the best choices for different tasks can be judged. The analysis suggests that for normal operations and anticipated transients event-based procedures are best, with the provision of fall-back state-based

procedures. State-based procedures should be available for multiple failure events or where diagnosis is not possible. Also, this paper discusses the impact of computerization on the different types of procedure bases. Different levels of computerization are studied from a simple library to artificial intelligence. General conclusions are given, suggesting that computerization of event-based procedures would provide some benefit, and that improvements to state-based procedures would only be effective if expert systems were developed. Full automation of emergency operating procedures seems possible using Artificial Intelligence systems, but the development costs would be high. (author). 1 ref., 8 tabs.

15544 (IAEA-IWG-NPPCI–93/1, pp. 261-274) **Unit shutdown software.** Tschiesche, J. (Ustav Jaderneho Vyzkumu a.s., Rez (Czech Republic)). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

The paper Unit Shutdown Software contains a description of software which is to be used by the WWER 440 type NPP unit manager during unit shutdown operations. The software enables to display measured or calculated values on the basis of real-time technological process data acquisition, provides advices during unit shutdown and, in the cases when there is a faulty intervention or inception of dangerous situation during the unit shutdown process, produces warnings. (author). 4 figs.

15545 (IAEA-IWG-NPPCI–93/1, pp. 275-286) **Some issues of significant electric equipment data presentation to operating personnel.** Dopjera, J. (Nuclear Power Plants Research Inst., Trnava (Czech Republic)); Kubanyi, J.; Gese, A.; Zofcik, S.; Jankovic, M. International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

Operating experience data of Czechoslovak as well as foreign WWER-440 nuclear power plants document that faults and failures of electric equipment should be the subject of large care. The aim of research and development (R and D) effort in Nuclear Power Plants Research Institute (NPPRI) in this area is implementation of advanced technical systems for plant safety and reliability related electric components and systems, including power supplying systems of instrumentation and control, monitoring and assessment. Some results of R and D effort in NPPRI in the field of obtaining of high quality and complex electric equipment data, their transfer and possible presentation of carefully selected information to the operator are given in the paper. An example of implementation of a technical system that serves for organized measurement and simultaneously for continuous monitoring, automatic fault conditions recording, relevant data processing and assessment is presented in the paper. These issues concern also the general problem of establishing new plant technical specifications and limiting working conditions in connection with running WWER-440's modernization processes. (author). 6 refs, 1 fig.

15546 (IAEA-IWG-NPPCI–93/1, pp. 287-302) **Operating procedure and operator's decision-making process.** Gieci, A. (Nuclear Power Plants Research Inst., Trnava (Czech Republic)). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

The paper presents some new views on the field of the creation of efficiently usable operating procedures. In addition to some rather traditional analyses of job type or task-analysis used up to now in instruction assembly there is cognitive-tasks analysis presented. Using the last mentioned approach such operator's recognitive activity requirements are investigated, which apply in the situations where operator's decision problems are solved. It is known that man's recognitive activity has its own rules. Therefore we attempted to propose such operating procedures which are able with respect to its form and contents to help an operator to recognize a failing situation correctly and to solve it regularly. The expert systems technology has appeared to be necessary for implementation of such support system. (author). 5 refs, 5 figs.

15547 (IAEA-IWG-NPPCI–93/1, pp. 303-313) **Recent advancement in the area of Man-Machine Interface.** Swaton, E. (International Atomic Energy Agency, Vienna (Austria)); Kossilov, A. International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1993. (CONF-9203321–: Specialists meeting on operating procedures for nuclear power plants and their presentation, Vienna (Austria), 31 Mar - 2 apr 1992). In *Operating procedures for nuclear power plants and their presentation. Working material. Proceedings of a specialists meeting held in Vienna, 31 March - 2 April 1992.* 322p. Order Number DE95627979. Source: OSTI; NTIS (US Sales Only); INIS.

Automation and Operator Support Systems, as well as Man-Machine Interface were always in the scope of major IAEA activities. Many technical, economic and safety aspects have been discussed at IAEA meetings and have been included in the IAEA Programme. The Agency co-operates closely with other organizations to promote better understanding of all problems concerning the subject area. The paper describes the relevant IAEA activities in the framework of the Division of Nuclear Safety and the Division of Nuclear Power. (author). 10 refs, 2 figs.

15548 (IAEA-IWG-NPPCI–95/1) **Co-ordinated research programme on operator support systems in nuclear power plants. Working material. Report of a research co-ordinated meeting held in Rome, 10-14 October 1994.** International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1995. 375p. (CONF-9410339–: Research co-ordination meeting on operator support systems in nuclear power plants, Rome (Italy), 10-14 Oct 1994). Order Number DE95627980. Source: OSTI; NTIS (US Sales Only); INIS.

In September 1991, the IAEA Committee for Contractual Scientific Services approved the Co-ordinated Research Programme (CRP) on "Operator Support Systems (OSS) in Nuclear Power Plants" in the framework of the Project "Man-Machine Interface Studies". The main objective of the programme is to provide guidance and technology transfer in the development and implementation of OSSs, including the experience with man-machine interface and closely related issues such as instrumentation and control, the use of computers, and operator qualification. The third meeting of the CRP participants was held in Rome/Italy, from 10 to 14 October 1994 and was sponsored by the ANPA. The meeting reviewed the progress of the CRP tasks, considered the reports of national activities in the subject area and agreed on the time scheduled for the preparation of the final report. The present volume contains: materials prepared by the CRP meeting; list of the CRP participants; and reports presented by the national delegates. Refs, figs and tabs.

Most nuclear power plants in the United States continue to operate with analog instrumentation and control (I and C) technology designed 20 to 40 years ago. This equipment is approaching or exceeding its life expectancy, resulting in increasing maintenance efforts to sustain system performance. Decreasing availability of replacement parts and the accelerating deterioration of the infrastructure of manufacturers that support analog technology exacerbate obsolescence problems and resultant operation and maintenance (O and M) cost increases. Modern digital technology holds a significant potential to improve the safety, cost-effectiveness, productivity, and, therefore, competitiveness of nuclear power plants. Operator support systems provide the tools to help achieve this potential. Reliable, integrated information is a critical element for protecting the utility's capital investment and increasing availability, reliability, and productivity. Integrated operator support systems with integrated information can perform more effectively to increase productivity, to enhance safety, and to reduce O and M costs. The plant communications and computing architecture is the infrastructure needed to allow the implementation of I and C systems and associated operator support systems in an integrated manner. Current technology for distributed digital systems, plant process computers, and plant communications and computing networks support the integration of systems and information. (author). 16 refs.

15555 (IAEA-IWG-NPPCI–95/1, pp. 149-207) **Determine what requirements should be established for verification and validation of OSS software, and which techniques are available to improve V and V. Task 4.5.3.** International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1995. (CONF-9410339–: Research co-ordination meeting on operator support systems in nuclear power plants, Rome (Italy), 10-14 Oct 1994). Verification and validation (V and V) is the process to ensure that a system is designed according to its requirements and to confirm that the system actually performs the required functions completely and reliably. V and V methodology and guidelines are fundamental to all digital implementations in nuclear plants. The objectives of R and D projects in the area of V and V are to: Evaluate V and V standards are methods for applicability in enhancing operator support systems at nuclear power plants; Develop new V and V standards and methods when those existing do not entirely meet the needs of these new applications; ensure that V and V of operator support systems is sufficient to meet design requirements and fully demonstrate that operator support systems function as intended; provide communication of V and V methods and requirements so that they are properly utilized; provide V and V methods and tools which will allow the process to be performed consistently

and efficiently, and which enhance acceptance from users, management, vendors, and regulators. Refs.

(CONF-9410339–: Research co-ordination meeting on operator support systems in nuclear power plants, Rome (Italy), 10-14 Oct 1994). In *Co-ordinated research programme on operator support systems in nuclear power plants. Working material. Report of a research co-ordinated meeting held in Rome, 10-14 October 1994.* 375p. Order Number DE95627980. Source: OSTI; NTIS (US Sales Only); INIS.

The commitment of the group working on the OSS developed in CNEA (Argentine Atomic Energy Commission) is centred in the following items of the Coordinated Research Program: (1) Item 4.1.2: Survey of existing operator support systems and the experience with them; (2) Item 4.1.3: Survey of anticipated functional requirements and experience; (3) Item 4.2.2: Evaluation of functions and identification of where OSS can support those functions in a productive way; (4) Item 4.3.3: Develop guidance on how the end user should be involved in the development of OSS. The survey includes a summary of the national activities related with the area, beyond the responsibilities of the CRP group. 6 refs.

According to the experience coming from countries where new concepts of nuclear power plants control rooms equipped with integrated system of OSSs have recently been largely tested in experimental centres equipped with powerful real-time plant simulators (e.g. NORWAY - Halden project; Japan) a training in use of the OSS is important, so that the operator can use it in the right situation and in right manner. Experiments, in which mostly experienced active control room operators from operating NPPs took part showed as well, that both the requirements for additional basic education of operators and the planning of training is influenced by a number of different factors like complexity of system structure and interface, system function, capabilities of training centres, operators background, experience and age and others. 6 refs.

15559 (IAEA-IWG-NPPCI–95/1, pp. 234-250) **A method for analysis of nuclear power plant operators' decision making in simulated disturbance situations.** International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1995. (CONF-9410339–: Research co-ordination meeting on operator support systems in nuclear power plants, Rome (Italy), 10-14 Oct 1994). In *Co-ordinated research programme on operator support systems in nuclear power plants. Working material. Report of a research co-ordinated meeting held in Rome, 10-14 October 1994.* 375p. Order Number DE95627980. Source: OSTI; NTIS (US Sales Only); INIS.

An analysis method has been developed for analysis of nuclear power plant operators' decision making in simulated disturbance situations. The aim of the analysis is to investigate operators' orientation which is expected to manifest itself as collective strategies in utilization of resources of decision making. Resources analyzed here are different information sources and, in addition, collaborative resources like communication and participation. The cognitive approach on the basis of the method considers decision making as collective construction of common interpretation of available information. Utilization of information is evaluated with respect to operative context. This is made with help of conceptualization of the disturbance situation from the decision making point of view and by construction of operative reference for activity. The latter means conceptualization of the situation from the safety point of view and also consideration of other boundary constraints of decision making, i.e. economical and technical aspects. The analysis method is intended to be used in routine simulator training in nuclear power plants. By virtue of its contextual and dynamical approach it makes the developing nature of activity visible. Cumulation and distribution of knowledge of decision making as developing activity, controlled by orientation and boundary constraints of process control, is expected to improve operational culture of a plant organization. 15560 (IAEA-IWG-NPPCI–95/1, pp. 251-259) **Formal methods in design and verification of functional specifications.** Vaelisuo, H. (VTT Automation (Finland)). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1995. (CONF-9410339–: Research co-ordination meeting on operator support systems in nuclear power plants, Rome (Italy), 10-14 Oct 1994). In *Co-ordinated research programme on operator support systems in nuclear power plants. Working material. Report of a research co-ordinated meeting held in Rome, 10-14 October 1994.* 375p. Order Number DE95627980. Source: OSTI; NTIS (US Sales Only); INIS.

It is claimed that formal methods should be applied already when specifying the functioning of the control/monitoring system, i.e. when planning how to implement the desired operation of the plant. Formal methods are seen as a way to mechanize and thus automate part of the planning. All mathematical methods which can be applied on related problem solving should be considered as formal methods. Because formal methods can only support the designer, not replace him/her, they must be integrated into a design support tool. Such a tool must also aid the designer in getting the correct conception of the plant and its behaviour. The use of a hypothetic design support tool is illustrated to clarify the requirements such a tool should fulfill. (author). 3 refs, 5 figs.

15561 (IAEA-IWG-NPPCI–95/1, pp. 261-270) **Strategy generation in accident management support.** Sirola, M. (Technical Research Centre of Finland (Finland)). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1995. (CONF-9410339–: Research co-ordination meeting on operator support systems in nuclear power plants, Rome (Italy), 10-14 Oct 1994). In *Co-ordinated research programme on operator support systems in nuclear power plants. Working material. Report of a research co-ordinated meeting held in Rome, 10-14 October 1994.* 375p. Order Number DE95627980. Source: OSTI; NTIS (US Sales Only); INIS.

An increased interest for research in the field of Accident Management can be noted. Several international programmes have been started in order to be able to understand the basic physical and chemical phenomena in accident conditions. A feasibility study has shown that it would be possible to design and develop a computerized support system for plant staff in accident situations. To achieve this goal the Halden Project has initiated a research programme on Computerized Accident Management Support (CAMS project). The aim is to utilize the capabilities of computerized tools to support the plant staff during the various accident stages. The

system will include identification of the accident state, assessment of the future development of the accident and planning of accident mitigation strategies. A prototype is developed to support operators and the Technical Support Centre in decision making during serious accident in nuclear power plants. A rule based system has been built to take care of the strategy generation. This system assists plant personnel in planning control proposals and mitigation strategies from normal operation to severe accident conditions. The ideal of a safety objective tree and knowledge from the emergency procedures have been used. Future prediction requires good state identification of the plant status and some knowledge about the history of some critical variables. The information needs to be validated as well. Accurate calculations in simulators and a large database including all important information form the plant will help the strategy planning. (author). 12 refs, 2 figs.

15562 (IAEA-IWG-NPPCI–95/1, pp. 271-287) **Fault tree and failure mode and effects analysis of a digital safety function.** Maskuniitty, M. (VTT Automation, Industrial Automation (Finland)); Pulkkinen, U. International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1995. In *Co-ordinated research programme on operator support systems in nuclear power plants. Working material. Report of a research co-ordinated meeting held in Rome, 10-14 October 1994.* 375p. Order Number DE95627980. Source: OSTI; NTIS (US Sales Only); INIS.

The principles of fault tree and failure mode and effects analysis (FMEA) for the analysis of digital safety functions of nuclear power plants are discussed. Based on experiences from a case study, a proposal for a full scale analysis is presented. The feasibility and applicability the above mentioned reliability engineering methods are discussed. (author). 13 refs, 1 fig., 2 tabs.

15563 (IAEA-IWG-NPPCI–95/1, pp. 289-297) **Validation of programmable industrial automation systems for safety critical applications in NPP's; dynamic testing.** Haapanen, P. (Technical Research Centre of Finland, Espoo (Finland)); Korhonen, J. International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1995. (CONF-9410339–: Research co-ordination meeting on operator support systems in nuclear power plants, Rome (Italy), 10-14 Oct 1994). In *Co-ordinated research programme on operator support systems in nuclear power plants. Working material. Report of a research co-ordinated meeting held in Rome, 10-14 October 1994.* 375p. Order Number DE95627980. Source: OSTI; NTIS (US Sales Only); INIS.

The safety assessment of programmable automation systems cannot be totally be based on conventional probabilistic methods because of the difficulties in quantification of the reliability of the software as well as the hardware. Additional means shall therefore be used to gain more confidence on the system dependability. One central confidence building measure is the independent dynamic testing of the completed system. An automated test harness is needed to run the required large amount of test cases in a restricted time span. This paper describes a prototype dynamic testing harness for programmable digital systems developed at VTT. (author). 12 refs, 2 figs, 2 tabs.

15564 (IAEA-IWG-NPPCI–95/1, pp. 299-308) **Experience with the upgraded VERONA-u. A WWER-440 core monitoring system.** Lux, I. (KFKI Atomic Energy Research Inst., Budapest (Hungary). Applied Reactor Physics Dept.); Vegh, J.; Adorjan, F.; Buerger, L. International Atomic Energy Agency, Vienna (Austria). On the occasion of the 1993 CRP Meeting in Budapest the working group has determined the main lines of the elaboration of the task objective. The present Reflections are meant to give a somewhat deeper presentation of the thoughts put forward by the working group and also to propose a basis for further discussions before the final formulation of the guidance in question. 6 refs, 2 tabs.

15566 (IAEA-IWG-NPPCI–95/1, pp. 317-341) **1994 report on Tasks 4.3.1 and 4.3.2: Survey of anticipated requirements and qualification requirements for OSS.** Silvani, V. International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1995. (CONF-9410339–: Research co-ordination meeting on operator support systems in nuclear power plants, Rome (Italy), 10-14 Oct 1994). In *Co-ordinated research programme on operator support systems in nuclear power plants. Working material. Report of a research co-ordinated meeting held in Rome, 10-14 October 1994.* 375p. Order Number DE95627980. Source: OSTI; NTIS (US Sales Only); INIS.

This is a preliminary report summarizing some topics related to the survey on functional and qualification requirements of Operator Support Systems (OSS's) in NPP's. This document has been prepared on the basis of the information presented in the previous meetings of this CRP working group. Additional information are expected when the answers to the working group questionnaire will be available. Functionalities examined are those referring to system functions and user's needs; technology trends are also considered. For practical purposes this document is divided in the followings: Summary of major OSS requirements and related problems as derived from the existing literature; appendix 1 reporting a summary of major functions performed by the OSS's presently in operation or under development in laboratories; appendix 2 reporting the list of standards for critical software. 18 refs, tabs.

15567 (IAEA-IWG-NPPCI–95/1, pp. 343-348) **Contribution to the Task 4.3.1 investigate how training should be planned to ensure efficient utilization of OSS. Task 4.3.2 evaluate how the introduction of OSS influences requirements to the basic education of the operator.** Balducelli, C. (ENEA, Rome (Italy)). International Atomic Energy Agency, Vienna (Austria). International Working Group on Nuclear Power Plant Control and Instrumentation. 1995. (CONF-9410339–: Research co-ordination meeting on operator support systems in nuclear power plants, Rome (Italy), 10-14 Oct 1994). In *Co-ordinated research programme on operator support systems in nuclear power plants. Working material. Report of a research co-ordinated meeting held in Rome, 10-14 October 1994.* 375p. Order Number DE95627980. Source: OSTI; NTIS (US Sales Only); INIS.

The introduction of computerized supports to improve efficiency in the activity of an intelligent agent (the operator in NPP case) increases the agent training demand. In fact also the informatic support can be viewed as an "artificial agent", more or less "active" depending on its internal degree of autonomy: the human agent needs to be trained to "coordinate" his behaviour with the behaviour of the artificial agent. The basic idea of this work is that a more safe, complete and integrated OSS could be a system (an artificial agent) that gives support to the human agent not only during the plant real operations, but also during the different phases of operator education and training for normal and emergency situations management. 7 refs, 2 figs.

The following projects at ECN related to the IAEA Coordinated Research Program on 'Operator Support Systems in NPP' are described: the Accident Management Support project partially funded by the European Union; modification of the IPSO display at the Borssele NPP.

15570 (INIS-JP–027, pp. 121-130) **Intelligent control system Cellular Robotics Approach to Nuclear Plant control and maintenance.** Fukuda, Toshio (Nagoya Univ. (Japan). School of Engineering); Sekiyama, Kousuke; Xue Guoqing; Ueyama, Tsuyoshi. Japan Atomic Energy Research Inst., Tokyo (Japan). 1994. 431p. (CONF-9405245–: AIR'94: specialists' meeting on application of artificial intelligence and robotics of nuclear plants, Tokai (Japan), 30 May - 1 jun 1994). In *Proceedings of specialists' meeting on application of artificial intelligence and robotics to nuclear plants*. Order Number DE95709894. Source: OSTI; NTIS; INIS.

This paper presents the concept of Cellular Robotic System (CEBOT) and describe the strategy of a distributed sensing, control and planning as a Cellular Robotics Approach to the Nuclear Plant control and maintenance. Decentralized System is effective in large plant and The CEBOT possesses desirable features for realization of Nuclear Plant control and maintenance because of its flexibility and adaptability. Also, as related on going research work, self-organizing manipulator and communication issues are mentioned. (author).

15571 (NUREG/CR–6046) **Alertness, performance and off-duty sleep on 8-hour and 12-hour night shifts In a simulated continuous operations control room setting.** Baker, T.L. (Institute for Circadian Physiology, Boston, MA (United States)). Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Institute for Circadian Physiology, Boston, MA (United States). Apr 1995. 142p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Source: OSTI; NTIS; GPO; INIS.

A growing number of nuclear power plants in the United States have adopted routine 12-hr shift schedules. Because of the potential impact that extended work shifts could have on safe and efficient power plant operation, the U.S. Nuclear Regulatory Commission funded research on 8-hr and 12-hr shifts at the Human Alertness Research Center (HARC) in Boston, Massachusetts. This report describes the research undertaken: a study of simulated 8-hr and 12-hr work shifts that compares alertness, speed, and accuracy at responding to simulator alarms, and relative cognitive performance, self-rated mood and vigor, and sleep-wake patterns of 8-hr versus 12-hr shift workers.

15572 (NUREG/CR–6316-Vol.1) **Guidelines for the verification and validation of expert system software and conventional software: Project summary. Volume 1.** Mirsky, S.M. (Science Applications International Corp., McLean, VA (United States)); Hayes, J.E.; Miller, L.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Electric Power Research Inst., Palo Alto, CA (United States). Nuclear Power Div.; Science Applications International Corp., McLean, VA (United States). Mar 1995. 158p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). (SAIC–95/1028-Vol.1). Source: OSTI; NTIS; GPO; INIS.

This eight-volume report presents guidelines for performing verification and validation (V&V) on Artificial Intelligence (AI) systems with nuclear applications. The guidelines have much broader application than just expert systems; they are also applicable to object-oriented programming systems, rule-based systems, frame-based systems, model-based systems, neural nets, genetic algorithms, and conventional software systems. This is because many of the components of AI systems are implemented in conventional procedural programming languages, so there is no real distinction. The report examines the state of the art in verifying and validating expert systems. V&V methods traditionally applied to conventional software systems are evaluated for their applicability to expert systems. One hundred fifty-three conventional techniques are identified and evaluated. These methods are found to be useful for at least some of the components of expert systems, frame-based systems, and object-oriented systems. A taxonomy of 52 defect types and their delectability by the 153 methods is presented. With specific regard to expert systems, conventional V&V methods were found to apply well to all the components of the expert system with the exception of the knowledge base. The knowledge base requires extension of the existing methods. Several innovative static verification and validation methods for expert systems have been identified and are described here, including a method for checking the knowledge base "semantics" and a method for generating validation scenarios. Evaluation of some of these methods was performed both analytically and experimentally. A V&V methodology for expert systems is presented based on three factors: (1) a system's judged need for V&V (based in turn on its complexity and degree of required integrity); (2) the life-cycle phase; and (3) the system component being tested.

15573 (NUREG/CR–6316-Vol.2) **Guidelines for the verification and validation of expert system software and conventional software: Survey and assessment of conventional software verification and validation methods. Volume 2.** Mirsky, S.M. (Science Applications International Corp., McLean, VA (United States)); Groundwater, E.H.; Hayes, J.E.; Miller, L.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Electric Power Research Inst., Palo Alto, CA (United States). Nuclear Power Div.; Science Applications International Corp., McLean, VA (United States). Mar 1995. 176p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). (SAIC–95/1028-Vol.2). Source: OSTI; NTIS; GPO; INIS.

By means of a literature survey, a comprehensive set of methods was identified for the verification and validation of conventional software. The 153 methods so identified were classified according to their appropriateness for various phases of a developmental life-cycle – requirements, design, and implementation; the last category was subdivided into two, static testing and dynamic testing methods. The methods were then characterized in terms of eight rating factors, four concerning ease-of-use of the methods and four concerning the methods' power to detect defects. Based on these factors, two measurements were developed to permit quantitative comparisons among methods, a Cost-Benefit metric and an Effectiveness Metric. The Effectiveness Metric was further refined to provide three different estimates for each method, depending on three classes of needed stringency of V&V (determined by ratings of a system's complexity and required-integrity). Methods were then rank-ordered for each of the three classes by terms of their overall cost-benefits and effectiveness. The applicability was then assessed of each for the identified components of knowledge-based and expert systems, as well as the system as a whole.

15574 (NUREG/CR–6316-Vol.3) **Guidelines for the verification and validation of expert system software and conventional**

software: Survey and documentation of expert system verification and validation methodologies. Volume 3. Groundwater, E.H. (Science Applications International Corp., McLean, VA (United States)); Miller, L.A.; Mirsky, S.M. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Electric Power Research Inst., Palo Alto, CA (United States). Nuclear Power Div.; Science Applications International Corp., McLean, VA (United States). Mar 1995. 100p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). (SAIC–95/1028-Vol.3). Source: OSTI; NTIS; GPO; INIS.

This report is the third volume in the final report for the Expert System Verification and Validation (V&V) project which was jointly sponsored by the Nuclear Regulatory Commission and the Electric Power Research Institute. The ultimate objective is the formulation of guidelines for the V&V of expert systems for use in nuclear power applications. The purpose of this activity was to survey and document techniques presently in use for expert system V&V. The survey effort included an extensive telephone interviewing program, site visits, and a thorough bibliographic search and compilation. The major finding was that V&V of expert systems is not nearly as established or prevalent as V&V of conventional software systems. When V&V was used for expert systems, it was almost always at the system validation stage after full implementation and integration usually employing the non-systematic dynamic method of "ad hoc testing." There were few examples of employing V&V in the early phases of development and only weak sporadic mention of the possibilities in the literature. There is, however, a very active research area concerning the development of methods and tools to detect problems with, particularly, rule-based expert systems. Four such static-testing methods were identified which were not discovered in a comprehensive review of conventional V&V methods in an earlier task.

15575 (NUREG/CR–6316-Vol.4) **Guidelines for the verification and validation of expert system software and conventional software: Evaluation of knowledge base certification methods. Volume 4.** Miller, L.A. (Science Applications International Corp., McLean, VA (United States)); Hayes, J.E.; Mirsky, S.M. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Electric Power Research Inst., Palo Alto, CA (United States). Nuclear Power Div.; Science Applications International Corp., McLean, VA (United States). Mar 1995. 122p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). (SAIC–95/1028-Vol.4). Source: OSTI; NTIS; GPO; INIS.

This report presents the results of the Knowledge Base Certification activity of the expert systems verification and validation (V&V) guideline development project which is jointly funded by the US Nuclear Regulatory Commission and the Electric Power Research Institute. The ultimate objective is the formulation of guidelines for the V&V of expert systems for use in nuclear power applications. This activity is concerned with the development and testing of various methods for assuring the quality of knowledge bases. The testing procedure used was that of behavioral experiment, the first known such evaluation of any type of V&V activity. The value of such experimentation is its capability to provide empirical evidence for – or against – the effectiveness of plausible methods in helping people find problems in knowledge bases. The three-day experiment included 20 participants from three nuclear utilities, the Nuclear Regulatory Commission's Technical training Center, the University of Maryland, EG&G Idaho, and SAIC. The study used two real nuclear expert systems: a boiling water reactor emergency operating procedures tracking system and a pressurized water reactor safety assessment systems. Ten participants were assigned to each of the expert systems. All participants were trained in and then used a sequence of four different V&V methods selected as being the best and most appropriate for study on the basis of prior evaluation activities. These methods either involved the analysis and tracing of requirements to elements in the knowledge base (requirements grouping and requirements tracing) or else involved direct inspection of the knowledge base for various kinds of errors. Half of the subjects within each system group used the best manual variant of the V&V methods (the control group), while the other half were supported by the results of applying real or simulated automated tools to the knowledge bases (the experimental group).

15576 (NUREG/CR–6316-Vol.5) **Guidelines for the verification and validation of expert system software and conventional software: Rationale and description of V&V guideline packages and procedures. Volume 5.** Mirsky, S.M. (Science Applications International Corp., McLean, VA (United States)); Hayes, J.E.; Miller, L.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Electric Power Research Inst., Palo Alto, CA (United States). Nuclear Power Div.; Science Applications International Corp., McLean, VA (United States). Mar 1995. 99p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). (SAIC–95/1028-Vol.5). Source: OSTI; NTIS; GPO; INIS.

This report is the fifth volume in a series of reports describing the results of the Expert System Verification C, and Validation (V&V) project which is jointly funded by the U.S. Nuclear Regulatory Commission and the Electric Power Research Institute toward the objective of formulating Guidelines for the V&V of expert systems for use in nuclear power applications. This report provides the rationale for and description of those guidelines. The actual guidelines themselves are presented in Volume 7, "User's Manual." Three factors determine what V&V is needed: (1) the stage of the development life cycle (requirements, design, or implementation); (2) whether the overall system or a specialized component needs to be tested (knowledge base component, inference engine or other highly reusable element, or a component involving conventional software); and (3) the stringency of V&V that is needed (as judged from an assessment of the system's complexity and the requirement for its integrity to form three Classes). A V&V Guideline package is provided for each of the combinations of these three variables. The package specifies the V&V methods recommended and the order in which they should be administered, the assurances each method provides, the qualifications needed by the V&V team to employ each particular method, the degree to which the methods should be applied, the performance measures that should be taken, and the decision criteria for accepting, conditionally accepting, or rejecting an evaluated system. In addition to the Guideline packages, highly detailed step-by-step procedures are provided for 11 of the more important methods, to ensure that they can be implemented correctly. The Guidelines can apply to conventional procedural software systems as well as all kinds of AI systems.

15577 (NUREG/CR–6316-Vol.6) **Guidelines for the verification and validation of expert system software and conventional software: Validation scenarios. Volume 6.** Mirsky, S.M. (Science Applications International Corp., McLean, VA (United States)); Hayes, J.E.; Miller, L.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Electric Power Research Inst., Palo Alto, CA (United States). Nuclear Power Div.; Science Applications International Corp., McLean, VA (United States). Mar 1995. 46p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). (SAIC–95/1028-Vol.6). Source: OSTI; NTIS; GPO; INIS.

This report is the sixth volume in a series of reports describing the results of the Expert System Verification and Validation (V&V) project which is jointly funded by the US Nuclear Regulatory Commission and the Electric Power Research Institute. The ultimate objective is the formulation of guidelines for the V&V of expert systems for use in nuclear power applications. This activity was concerned with the development of a methodology for selecting validation scenarios and subsequently applying it to two expert systems used for nuclear utility applications. Validation scenarios were defined and classified into five categories: PLANT, TEST, BASICS, CODE, and LICENSING. A sixth type, REGRESSION, is a composite of the others and refers to the practice of using trusted scenarios to ensure that modifications to software did not change unmodified functions. Rationale was developed for preferring scenarios selected from the categories in the order listed and for determining under what conditions to select scenarios from other types. A procedure incorporating all of the recommendations was

developed as a generalized method for generating validation scenarios. The procedure was subsequently applied to two expert systems used in the nuclear industry and was found to be effective, given that an experienced nuclear engineer made the final scenario selections. A method for generating scenarios directly from the knowledge base component was suggested.

15578 (NUREG/CR–6316-Vol.7) **Guidelines for the verification and validation of expert system software and conventional software: User's manual. Volume 7.** Mirsky, S.M. (Science Applications International Corp., McLean, VA (United States)); Hayes, J.E.; Miller, L.A. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Electric Power Research Inst., Palo Alto, CA (United States). Nuclear Power Div.; Science Applications International Corp., McLean, VA (United States). Mar 1995. 230p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). (SAIC–95-1028-Vol.7). Source: OSTI; NTIS; GPO; INIS.

This report provides a step-by-step guide, or user manual, for personnel responsible for the planning and execution of the verification and validation (V&V), and developmental testing, of expert systems, conventional software systems, and various other types of artificial intelligence systems. While the guide was developed primarily for applications in the utility industry, it applies well to all industries. The user manual has three sections. In Section 1 the user assesses the stringency of V&V needed for the system under consideration, identifies the development stage the system is in, and identifies the component(s) of the system to be tested next. These three pieces of information determine which Guideline Package of V&V methods is most appropriate for those conditions. The V&V Guideline Packages are provided in Section 2. Each package consists of an ordered set of V&V techniques to be applied to the system, guides on choosing the review/evaluation team, measurement criteria, and references to a book or report which describes the application of the method. Section 3 presents details of 11 of the most important (or least well-explained in the literature) methods to assist the user in applying these techniques accurately.

15579 (NUREG/CR–6316-Vol.8) **Guidelines for the verification and validation of expert system software and conventional software: Bibliography. Volume 8.** Miller, L.A. (Science Applications International Corp., McLean, VA (United States)); Hayes, J.E.; Mirsky, S.M. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Systems Technology; Electric Power Research Inst., Palo Alto, CA (United States). Nuclear Power Div.; Science Applications International Corp., McLean, VA (United States). Mar 1995. 49p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). (SAIC–95/1028-Vol.8). Source: OSTI; NTIS; GPO; INIS.

This volume contains all of the technical references found in Volumes 1-7 concerning the development of guidelines for the verification and validation of expert systems, knowledge-based systems, other AI systems, object-oriented systems, and conventional systems.

15580 (STUK-YTO-TR–52) **Diversity and testing requirements of programmable automation systems.** Haapanen, P.; Maskuniitty, M. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Apr 1993. 58p. (In Finnish). Order Number DE95627982. Source: OSTI; NTIS; INIS.

In the report programmable digital operation and safety automation systems for nuclear power plants are discussed. The programmable systems deviate by their properties and behaviour from the conventional non-programmable systems in such extent, that their verification and validation for safety critical applications requires new methods and practices. The safety assessment can not be based on conventional probabilistic methods due to the difficulties in the quantification of the reliability of the software and hardware. A safety critical programmable system shall include diverse redundant parts so that no residual program fault can not cause the failure of the intended function of the system. Although complete testing of a programmable system is impossible, different tests have a central role in the production and validation process of the system. Diversity is important also in confidence building measures for the implemented system. Independent analysis and testing of the system should use different methods and tools from those used in the production and validation process by the system vendor. Use of diversity and testing are concluded to be central issues in producing safe programmable system and in proving them to be safe enough. By combining functional and programming diversity in a suitable way one can produce a system that is safe enough without having a non-programmable back-up system. (48 refs., 10 figs., 2 tabs.).

15581 (CONF-941144–114) **Neutron scattering at the high flux isotope reactor at Oak Ridge National Laboratory.** Yethiraj, M.; Fernandez-Baca, J.A. Oak Ridge National Lab., TN (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95008841. Source: OSTI; NTIS; INIS; GPO Dep.

Since its beginnings in Oak Ridge and Argonne in the late 1940's, neutron scattering has been established as the premier tool to study matter in its various states. Since the thermal neutron wavelength is of the same order of magnitude as typical atomic spacings and because they have comparable energies to those of atomic excitations in solids, both structure and dynamics of matter can be studied via neutron scattering. The High Flux Isotope Reactor (HFIR) provides an intense source of neutrons with which to carry out these measurements. This paper summarizes the available neutron scattering facilities at the HFIR.

15582 (HW–22572) **Technical activities report research and development & 234-5 metallurgy groups metallurgy - pile technology unit, October 1951.** Schalliol, W.L.; Wick, O.J. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 1 Nov 1951. 22p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95009449. Source: OSTI; NTIS; GPO Dep.

This is a technical progress report for the Research and Development, and 234-5 Metallurgy Groups of the metallurgy-pile technology unit for the period Oct 1951. Numerous reports are attached under the general areas: P-10 alloy development; uranium metallurgy; metallurgy of Hanford structural materials; radiometallurgy, facility development; plutonium metallurgy program; canning development; plant service work; 234-5 metallurgy group, plutonium metallurgy program.

15583 (HW–62273-Rev.2) **Graphite burnout, interim report on IP-25-A (PT-105-532-E).** Ryan, B.A.; Halas, D.R. de. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 15 Mar 1960. 49p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95009507. Source: OSTI; NTIS; GPO Dep.

Graphite reacts with such gases as CO_2, O_2, or water vapor to form gaseous oxides of carbon. In the case of CO_2-graphite interaction, the reaction rate is not significant until about 550 C. Water oxidizes graphite, very roughly, three times faster than CO_2. Air will oxidize graphite appreciably at temperatures below 500 C. Graphite removal from Hanford reactors is very important, since graphite is used both as a structural support and a moderator for neutrons. Griggs has shown that small graphite samples oxidized to 10 per cent weight loss had only about one-half their original compression strength. Hence, the longevity of the reactors depends to a great extent on maintaining a low graphite oxidation

rate. A means of monitoring the extent of graphite loss, i. e., the burnout rate, is necessary to establish future reactor operational standards. Presently, weighed samples of reactor grade graphite are placed along the length of an empty process channel in each reactor. Thus, a sample is exposed to the reactor's ambient conditions of power level, moderator temperature, and gas composition. This program was initiated in the vicinity of June, 1953 by Woodley. This report presents data on graphite burnout obtained from in-reactor experiments authorized under IP-25-A (PT-105-532-E) from August, 1957 to January, 1960. Burnout rates are obtained by a direct measurement of the weight loss of control graphite samples exposed to the reactor atmosphere.

Submitted to the Technical Commitee Meeting on Safety and Reliability Improvement Through Optimized Plant Maintenance, Vienna, Austria, 22-24 June 1992.

The condition-based maintenance is initiated as a result of a predetermained type of criteria which measure equipment degradation. In order to power plant safety and reliability improvment the authors propose to enrich the widely used threshold criteria by the new one resulting from cases, the type of preventive restoration actions the authors propose to connect additionally all of them into single and clear logical system. The system application for condition-based maintenance of the IBR-2 (JINR, Dubna) pulsed reactor is exemplified. 8 refs.; 4 figs.

15592 (LA-UR–95-951) **The use of deterministic codes for "separating the wheat from the chaff" in benchmark models and calculations.** O'Dell, R.D. Los Alamos National Lab., NM (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9505195–2: Nuclear criticality technology and safety project (NCTSP) annual meeting, San Diego, CA (United States), 17 May 1995). Order Number DE95009421. Source: OSTI; NTIS; INIS; GPO Dep.

An important effort in the field of nuclear criticality safety is the establishing and modeling of a set of benchmark critical (or near critical) experiments and the use of these benchmark experiment models to validate and verify computer codes and cross sections. For the most part Monte Carlo codes such as MCNP and KENO.VA have emerged as the codes of choice in the U.S. Since Monte Carlo codes generally have the capability of modeling complex geometries in great detail there is a tendency to focus attention on modeling an experiment in very great detail. Indeed, it is the author's observation that so much effort is expended trying to exactly model unimportant details (the 'chaff') that many of the truly significant features and characteristics (the 'wheat') of the experiment can be lost in the shuffle. An obvious question now arises. How does one determine what is 'wheat' and what is 'chaff'? This presentation will focus on the use of deterministic, or, more specifically, discrete-ordinates codes for performing sensitivity calculations in determining which details are important and which are not. The principal advantage of discrete-ordinates codes is that they can quite precisely determine the effect on k_{eff} associated with distinct details of an experiment such as impurities, external structure, conflicting or missing information, etc. Three different examples are used to demonstrate the value of using discrete-ordinates codes for separating the wheat from the chaff. It is also shown that, for all practical purposes, Monte Carlo codes are essentially unsuited for determining small effects on k_{eff}.

15593 (WHC-SD-SNF-DRR–002-Vol.1) **Design review report for the 105 K-East Basin dose reduction concept. Volume 1.** Dearing, J.I. Westinghouse Hanford Co., Richland, WA (United States). 30 Mar 1995. 43p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010134. Source: OSTI; NTIS; INIS; GPO Dep.

Radiological surveys in the 105 K-East Fuel Storage Basin show average dose rates of 4 to 50 mrem/hr. A major source of the dose is the radionuclides that have been absorbed into the concrete wall of the basin. This reports documents the design review of the concept for reducing the dose from the walls. Volume 1 comprises the Design Review Report and Volume 2 comprises the Design Review Package.

15594 (WHC-SD-TP-ANAL–002) **CNS 1-13G Cask lid support frame structural analysis.** Crow, S.R. Westinghouse Hanford Co., Richland, WA (United States). 30 Mar 1995. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95010144. Source: OSTI; NTIS; INIS; GPO Dep.

This document provides the structural analysis of the support frame for the Chem-Nuclear Systems (CNS) 1-13G Cask. The support frame will catch on underwater supports while the cask is being lowered into the pit, aiding in the removal of the cask lid in the load out chute in the K-Basins.

15595 (ANL/TD/RP–85215) **Status report on the Experimental Boiling Water Reactor (EBWR) Decontamination and Decommissioning (D&D) Project.** Sears, L. (ALARON Corp., Cayce, SC (United States)); Garlock, G.; Mencarelli, R.; Fellhauer, C. Argonne National Lab., IL (United States); ALARON Corp., Cayce, SC (United States). 15 Aug 1994. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95009911. Source: OSTI; NTIS; INIS; GPO Dep.

ALARON Corporation is under contract, to Argonne National Laboratory - East (ANL-E), to complete the decontamination and decommissioning of the Experimental Boiling Water Reactor (EBWR). The project, begun, in 1986 by ANL-E personnel, is projected to be completed by the end of 1994. The final phase of work was awarded to ALARON in December 1993 with the scope of work including the disassembly and removal of all remaining reactor internals, the reactor vessel, the lead bio-shield, the core liner, and the activated portion of the concrete bio-shield. This paper discusses the work undertaken beginning in January 1994 and continuing through July 1994. During this period the required pre-mobilization documentation was prepared and approved, mobilization was completed, and the reactor internals, reactor vessel, lead bio-shield and core liner were removed. The paper will compare the planned schedule to the actual schedule, discuss problems encountered, review volume reduction techniques and health and safety issues including radiological aspects of the project.

15596 (BNL–52456) **Level 1 Tornado PRA for the High Flux Beam Reactor.** Bozoki, G.E.; Conrad, C.S. Brookhaven National Lab., Upton, NY (United States). May 1994. 304p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. Order Number DE95009162. Source: OSTI; NTIS; GPO Dep.

This report describes a risk analysis primarily directed at providing an estimate for the frequency of tornado induced damage to the core of the High Flux Beam Reactor (HFBR), and thus it constitutes a Level 1 Probabilistic Risk Assessment (PRA) covering tornado induced accident sequences. The basic methodology of the risk analysis was to develop a "tornado specific" plant logic model that integrates the internal random hardware failures with failures caused externally by the tornado strike and includes operator errors worsened by the tornado modified environment. The tornado hazard frequency, as well as earlier prepared structural and equipment fragility data, were used as input data to the model. To keep modeling/calculational complexity as simple as reasonable a "bounding" type, slightly conservative, approach was applied. By a thorough screening process a single dominant initiating event was selected as a representative initiator, defined as: "Tornado Induced Loss of Offsite Power." The frequency of this initiator was determined to be 6.37E-5/year. The safety response of the HFBR facility resulted in a total Conditional Core Damage Probability of .621. Thus, the point estimate of the HFBR's Tornado Induced Core Damage Frequency (CDF) was found to be: $(CDF)_{Tornado}$ = 3.96E-5/year. This value represents only 7.8% of the internal CDF and thus is considered to be a small contribution to the overall facility risk expressed in terms of total Core Damage Frequency. In addition to providing the estimate of $(CDF)_{Tornado}$, the report documents, the relative importance of various tornado induced system, component, and operator failures that contribute most to $(CDF)_{Tornado}$.

15597 (CONF-950601–8) **Using Level 1 PRA for enhanced safety of the Advanced Neutron Source Reactor.** Ramsey, C.T.; Linn, M.A. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Annual meeting of the American Nuclear Society; Philadelphia, PA (United States); 25-29 Jun 1995. Order Number DE95009180. Source: OSTI; NTIS; INIS; GPO Dep.

The Phase 1 Level I probabilistic risk assessment (PRA) of the Advanced Neutron Source Reactor (ANS) has been completed as part of the conceptual design phase of this proposed research facility. Since project inception, PRA and reliability concepts have been an integral part of the design evolution, contributing to many of the safety features in the current design. The Level I PRA has been used to evaluate the internal events core damage frequency against project goals, to identify systems important to safety and availability, and will continue to guide and provide support to accident analysis, both severe and nonsevere. The results also reflect the risk value of defense-in-depth safety features in reducing the likelihood of core damage.

15598 (HHS-CFR-B–10) **Medical and psychological aspects of crisis management during a nuclear accident.** Drottz-Sjoeberg, B.M. Stockholm School of Economics (Sweden). Center for Risk Research. Jun 1993. 18p. Order Number DE95627109. Source: OSTI; NTIS; INIS.

Crisis handling in most kinds of disasters is affected by e.g. the information situation, prior experience and preparedness, availability of resources, efficiency of leadership and coordination, and type of disaster. A nuclear accident creates a situation which differs from many 'normal' disasters and natural catastrophes, for example with respects to the invisible nature of radiation and radioactive contamination and thus the dependence on access to specific technical equipment and expertise, and to information about the radiation situation. The scope of the accident, and the existing levels of radiation, define subsequent actions; information policies and existing channels of communication lay the foundation for public reactions. The present paper explores some examples of public reactions, and crisis handling of some previous radiation accidents on the basis of two dimensions, i.e. degree of information availability and degree of impact or 'environmental damage'. The examples include the radiation accidents in the Chelyabinsk region in the southern Urals, at Three Mile Island, USA, at Chernobyl in the Ukraine, and in Goiania, Brazil. It is concluded that public reactions differ as a function of existing expectations, and the crisis handling is more affected by the existing organizational and social structures than by needs and reactions of potential victims. Another conclusion is that pre-disaster preparedness regarding public information, and organization of countermeasures, are crucial to the outcome of a successful crisis handling and for enhancing public trust in crisis management. 39 refs, 2 figs.

15599 (HHS-CFR-B–13) **Perceived risks and risk attitudes in southern Russia in the aftermath of the Chernobyl accident.** Drottz-Sjoeberg, B.M. (Stockholm School of Economics (Sweden). Center for Risk Research); Rumyantseva, G.M.; Martyvshov, A.N. Stockholm School of Economics (Sweden). Center for Risk Research. Oct 1993. 62p. Order Number DE95627110. Source: OSTI; NTIS; INIS.

The present study was conducted within the framework of the Joint Study Project 2 (JSP2), a research project involving the European Community and the Commonwealth of Independent States. The task involved the investigation of public reactions to radioactive contamination due to the Chernobyl accident in 1986. The here presented field-work was designed as a pilot investigation in a series of studies aimed at contributing to the understanding of social and psychological factors relevant to the design of countermeasures in the case of a future nuclear accident. The report presents questionnaire data collected from people living in Novozybkov and its surroundings in Russia, in the summer of 1992. The chosen areas had an overall surface contamination level of 15-40 Ci/km^2. The results showed that the respondents recalled the date of the accident surprisingly well. They often indicated that they had heard the first news of the accident via TV, radio or rumors. They often reported the content of that information to have been related to an explosion or a fire at a nuclear plant. They indicated that they at the time had a rather modest reaction to the news. Current worries especially concerned health risks due to the radioactive contamination, although the respondents also emphasized that ordinary life was filled with worries. Middle-aged persons and parents often indicated the highest personal worry. Risk ratings related to radiation and radioactive contamination were high. Ratings of perceived change in risk level since the accident of a variety of hazards showed an overall increase. 27 refs, 23 figs, 23 tabs.

15600 (INIS-BR–3488) **Civil liability on nuclear activities.** Bittar, C.A. Sao Paulo Univ., SP (Brazil). Faculdade de Direito. 1982. 247p. (In Portuguese). Order Number DE95627093. Source: OSTI; NTIS (US Sales Only); INIS.

The civil liability theory in the actual context is shown in the first and second part of this thesis, including some considerations about concepts and types of liability in dangerous and not dangerous activities. In the third part, the legal aspects of civil liability for the nuclear activities are analyzed, with a brief description of the history evolution, standard systems, inspection corporation and juridical regulation. (C.G.C.). 239 refs.

15601 (INIS-mf–14184) **Master catalogue of foreign reports on the safety of nuclear installations and radiological protection, kept at federal Office for Radiation Protection on behalf o the Federal Ministry of the Environment Nature Conservation and Nuclear Safety.** Bundesministerium fuer Umwelt, Naturschutz und Reaktorsicherheit, Bonn (Germany). Feb 1993. 46p. (In German). Order Number DE95006003. Source: OSTI; NTIS (US Sales Only); INIS.

The literature is sent to the Federal Ministry of the Environment (BWU) by foreign institutes or organizations within the framework of bilateral agreements. The reports and documents dealing with radiation protection and the safety of nuclear installations are retrievable from the catalogue by author/title or serial title. The bibliographic description of literature items follows the alphabetical cataloging rules (RAK-WAB).

15602 (KFK–5426) **The release code package REVOLS/RENONS for fission product release from a liquid sodium pool into inert gas atmosphere.** Starflinger, J. (Bochum Univ. (Germany). Lehrstuhl fuer Nukleare und Neue Energiesysteme); Koch, M.K.; Brockmeier, U.; Schuetz, W.; Scholtyssek, W.; Unger, H. Kernforschungszentrum Karlsruhe GmbH (Germany). Inst. fuer Neutronenphysik und Reaktortechnik; Kernforschungszentrum Karlsruhe GmbH (Germany). Projekt Nukleare Sicherheitsforschung. Dec 1994. 72p. Contract ETNU-CT92-0077. (RUB-E–75). Order Number DE95769844. Source: OSTI; NTIS (US Sales Only); INIS.

For aerosol source term considerations in the field of nuclear safety, the investigation of the release of volatile and non-volatile species from liquid surfaces into a gas atmosphere is important. In case of a hypothetical liquid metal fast breeder reactor accident with tank failure, primary coolant sodium with suspended or solved fuel particles and fission products may be released into the containment. The computer code package REVOLS/RENONS, based on a theoretical mechanistic model with a modular structure, has been developed for the prediction of sodium release as well as volatile and non-volatile radionuclide release from a liquid pool surface into the inert gas atmosphere of the inner containment. Hereby the release of sodium and volatile fission products, like cesium and sodium iodide, is calculated using a theoretical model in a mass transfer coefficient formulation. This model has been transposed into the code version REVOLS.MOD1.1, which is discussed here. It enables parameter analysis under highly variable user-defined boundary conditions. Whereas the evaporative release of the volatile components is governed by diffusive and convective transport processes, the release of the non-volatile ones may be governed by mechanical processes which lead to droplet entrainment from the wavy pool surface under conditions of natural or forced convection into the atmosphere. The mechanistic model calculates the liquid entrainment rate of the non-volatile species, like the fission product strontium oxide and the fuel (uranium dioxide) from a liquid pool surface into a parallel gas flow. The mechanistic model has been transposed into the computer code package REVOLS/RENONS, which is discussed here. Hereby the module REVOLS (RElease of VOLatile Species) calculates the evaporative release of the volatile species, while the module RENONS (RElease of NON-Volatile Species) computes the entrainment release of the non-volatile radionuclides. (orig./HP)

15603 (NUREG–1514) **Guidance for a large tabletop exercise for a nuclear power plant.** Weinstein, E.D. (Nuclear Regulatory Commission, Washington, DC (United States). Office for Analysis and Evaluation of Operational Data); Bates, E.F.; Adler, M.V.; Gant, K.S. Nuclear Regulatory Commission, Washington, DC (United States). Office for Analysis and Evaluation of Operational Data; Oak Ridge National Lab., TN (United States). Mar 1995. 67p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). Tabletop exercises are held to discuss issues related to the response of organizations to an emergency event. This document describes in task format the planning, conduct, and reporting of lessons learned for a large interagency tabletop. A sample scenario, focus areas, and discussion questions based on a simulated accident at a commercial nuclear power plant are provided.

15604 (NUREG/CR–6192) **Aging and service wear of spring-loaded pressure relief valves used in safety-related systems at nuclear power plants.** Staunton, R.H. (Oak Ridge National Lab., TN (United States)); Cox, D.F. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering Technology; Oak Ridge National Lab., TN (United States). Mar 1995. 80p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. (ORNL–6791). Source: OSTI; NTIS; GPO; INIS.

Spring-loaded pressure relief valves (PRVS) are used in some safety-related applications at nuclear power plants. In general, they are used in systems where, during accidents, pressures may rise to levels where pressure safety relief is required for protection of personnel, system piping, and components. This report documents a study of PRV aging and considers the severity and causes of service wear and how it is discovered and corrected in various systems, valve sizes, etc. Provided in this report are results of the examination of the recorded failures and identification of trends and relationships/correlations in the failures when all failure-related parameters are considered. Components that comprise a typical PRV, how those components fail, when they fail, and the current testing frequencies and methods are also presented in detail.

15605 (NUREG/CR–6220) **An assessment of fire vulnerability for aged electrical relays.** Vigil, R.A. (Sandia National Labs., Albuquerque, NM (United States)); Nowlen, S.P. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering Technology; Sandia National Labs., Albuquerque, NM (United States). Mar 1995. 36p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (SAND–94-0769). Source: OSTI; NTIS; INIS; GPO.

There has been some concern that, as nuclear power plants age, protective measures taken to control and minimize the impact of fire may become ineffective, or significantly less effective, and hence result in an increased fire risk. One objective of the Fire Vulnerability of Aged Electrical Components Program is to assess the effects of aging and service wear on the fire vulnerability of electrical equipment. An increased fire vulnerability of components may lead to an overall increase in fire risk to the plant. Because of their

widespread use in various electrical safety systems, electromechanical relays were chosen to be the initial components for evaluation. This test program assessed the impact of operational and thermal aging on the vulnerability of these relays to fire-induced damage. Only thermal effects of a fire were examined in this test program. The impact of smoke, corrosive materials, or fire suppression effects on relay performance were not addressed in this test program. The purpose of this test program was to assess whether the fire vulnerability of electrical relays increased with aging. The sequence followed for the test program was to: identify specific relay types, develop three fire scenarios, artificially age several relays, test the unaged and aged relays in the fire exposure scenarios, and compare the results. The relays tested were Agastat GPI, General Electric (GE) HMA, HGA, and HFA. At least two relays of each type were artificially aged and at least two relays of each type were new. Relays were operationally aged by cycling the relay under rated load for 2,000 operations. These relays were then thermally aged for 60 days with their coil energized.

15606 (NUREG/CR–6235) **Assessment of short through-wall circumferential cracks in pipes. Experiments and analysis: March 1990–December 1994.** Brust, F.W. (Battelle, Columbus, OH (United States)); Scott, P.; Rahman, S. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering Technology; Battelle, Columbus, OH (United States). Apr 1995. 243p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract FG02-90ER14135. (BMI–2179). Source: OSTI; NTIS; GPO; INIS.

This topical report summarizes the work performed for the Nuclear Regulatory Commission's (NRC) research program entitled "Short Cracks in Piping and Piping Welds" that specifically focuses on pipes with short through-wall cracks. Previous NRC efforts, conducted under the Degraded Piping Program, focused on understanding the fracture behavior of larger cracks in piping and fundamental fracture mechanics developments necessary for this technology. This report gives details on: (1) material property determinations, (2) pipe fracture experiments, and (3) development, modification, and validation of fracture analysis methods. The material property data required to analyze the experimental results are included. These data were also implemented into the NRC's PIFRAC database. Three pipe experiments with short through-wall cracks were conducted on large diameter pipe. Also, experiments were conducted on a large-diameter uncracked pipe and a pipe with a moderate-size through-wall crack. The analysis results reported here focus on simple predictive methods based on the J-Tearing theory as well as limit-load and ASME Section 11 analyses. Some of these methods were improved for short-crack-length predictions. The accuracy of the various methods was determined by comparisons with experimental results from this and other programs. 69 refs., 124 figs, 49 tabs.

15607 (NUREG/CR–6300) **Refinement and evaluation of crack-opening-area analyses for circumferential through-wall cracks in pipes.** Rahman, S. (Battelle, Columbus, OH (United States)); Brust, F.; Ghadiali, N.; Krishnaswamy, P.; Wilkowski, G.; Choi, Y.H.; Moberg, F.; Brickstad, B. Nuclear Regulatory Commission, Washington, DC (United States). Div. of Engineering Technology; Battelle, Columbus, OH (United States). Apr 1995. 224p. Sponsored by Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract FG02-90ER14135. (BMI–2184). Source: OSTI; NTIS; GPO; INIS.

Leak-before-break (LBB) analyses for circumferentially cracked pipes are currently being conducted in the nuclear industry to justify elimination of pipe whip restraints and jet impingement shields which are present because of the expected dynamic effects from pipe rupture. The application of the LBB methodology frequently requires calculation of leak rates. These leak rates depend on the crack-opening area of a through-wall crack in the pipe. In addition to LBB analyses, which assume a hypothetical flaw size, there is also interest in the integrity of actual leaking cracks corresponding to current leakage detection requirements in NRC Regulatory Guide 1.45, or for assessing temporary repair of Class 2 and 3 pipes that have leaks as are being evaluated in ASME Section 11. This study was requested by the NRC to review, evaluate, and refine current analytical models for crack-opening-area analyses of pipes with circumferential through-wall cracks. Twenty-five pipe experiments were analyzed to determine the accuracy of the predictive models. Several practical aspects of crack-opening such as; crack-face pressure, off-center cracks, restraint of pressure-induced bending, cracks in thickness transition regions, weld residual stresses, crack-morphology models, and thermal-hydraulic analysis, were also investigated. 140 refs., 105 figs., 41 tabs.

15608 (SAND–95-0561C) **Progress in MELCOR development and assessment.** Summers, R.M. (Sandia National Labs., Albuquerque, NM (United States). Modeling and Analysis Dept.); Kmetyk, L.N.; Cole, R.K. Jr.; Smith, R.C.; Elsbernd, A.E.; Stuart, D.S.; Thompson, S.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941074–2: 21. water reactor safety information meeting, Washington, DC (United States), 25-27 Oct 1994). Order Number DE95009590. Source: OSTI; NTIS; INIS; GPO Dep.

MELCOR models the progression of severe accidents in light water reactor nuclear power plants. Recent efforts in MELCOR development to incorporate CORCON-Mod3 models for core-concrete interactions, new models for advanced reactors, and improvements to several other existing models have resulted in release of MELCOR 1.8.3. In addition, continuing efforts to expand the code assessment database have filled in many of the gaps in phenomenological coverage. Efforts are now under way to develop models for chemical interactions of fission products with structural surfaces and for reactions of iodine in the presence of water, and work is also in progress to improve models for the scrubbing of fission products by water pools, the chemical reactions of boron carbide with steam, and the coupling of flow blockages with the hydrodynamics. Several code assessment analyses are in progress, and more are planned.

15609 (SIEMENS-KWU-S–554/92/011) **UPTF-TRAM test A2. Formation of stratified flow in the hot leg.** Tenckhoff; Brand, B.; Weiss, P. Siemens AG Unternehmensbereich KWU, Erlangen (Germany). Bereich Energieerzeugung; Siemens AG Unternehmensbereich KWU, Erlangen (Germany). Werkstoffe und Chemie. Oct 1992. 503p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 1500876. Order Number DE95768722. Source: OSTI; NTIS (US Sales Only); INIS.

The separate effect UPTF TRAM Test A2 consisting of six runs was designed to investigate flow regimes in the hot leg of a pressurized water reactor under two-phase natural circulation conditions. In particular, the following phenomena were investigated: - Formation of different flow regimes, e.g. stratified and slug flow in the hot leg under different boundary conditions; - Correlation between flow regime and boundary conditions of the system (mass flows, water level etc.); - Mechanism of the transport of water into the steam generator. The test runs are divided into two groups: (a) Test Runs 01a, 01b and 02b with steam injection through the core simulator: In these test runs the steam injection through the core simulator was increased stepwise. In each step the steam injection was kept constant for about 100 s in order to observe steady water distribution in the hot leg and SG-simulator of broken loop. (b) Test Runs 03c, 04c and 04d with steam and water injection through the core simulator: These test runs were performed at a constant steam injection rate and the water injection rate was increased stepwise. In order to verify the consistency of scaling with the pressure, the test runs were carried out at different pressures as: (a) Runs 01a and 01b at 15 bar, and Run 02b at 3 bar (b) Runs 03c, 04c and 04d at 15, 3 and 5 bar respectively. A preliminary evaluation of the test is presented in the Quick Look Report. (orig.)

15610 (SIEMENS-KWU-S–554/92/013) **UPTF test instrumentation. Measurement system identification, engineering units and computed parameters.** Sarkar, J.; Liebert, J.; Laeufer, R. Siemens AG Unternehmensbereich KWU, Erlangen (Germany). Bereich Energieerzeugung. Nov 1992. 327p. Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 1500876. Order Number DE95770095. Source: OSTI; NTIS (US Sales Only); INIS.

This updated version of the previous report /1/contains, besides additional instrumentation needed for 2D/3D Programme, the supplementary instrumentation in the inlet plenum of SG simulator and hot and cold leg of broken loop, the cold leg of intact loops and the upper plenum to meet the requirements (Test Phase A) of the UPTF Programme, TRAM, sponsored by the Federal Minister of Research and Technology (BMFT) of the Federal Republic of Germany. For understanding, the derivation and the description of the identification codes for the entire conventional and advanced measurement systems classifying the function, and the equipment unit, key, as adopted in the conventional power plants, have been included. Amendments have also been made to the appendices. In particular, the list of measurement systems covering the measurement identification code, instrument, measured quantity, measuring range, band width, uncertainty and sensor location has been updated and extended to include the supplementary instrumentation. Beyond these amendments, the uncertainties of measurements have been precisely specified. The measurement identification codes which also stand for the identification of the corresponding measured quantities in engineering units and the identification codes derived therefrom for the computed parameters have been adequately detailed. (orig.)

15611 (SIEMENS-KWU-S–554/93/002) **UPTF-TRAM test A3. Turn-over of the hot-leg injected ECC in the steam generator direction.** Tenckhoff; Brand, B.; Weiss, P. Siemens AG Unternehmensbereich KWU, Erlangen (Germany). Bereich Energieerzeugung; Siemens AG Unternehmensbereich KWU, Erlangen (Germany). Werkstoffe und Chemie. Jun 1993. 538p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 1500876. Order Number DE95768721. Source: OSTI; NTIS (US Sales Only); INIS.

The UPTF TRAM test A3 was a separate effects test to investigate the interaction between the hot leg-injected ECC and the single-phase or two-phase natural circulation in the hot leg in the case of an SBLOCA in a PWR. The experimental investigation of 7 runs was mainly concentrated on the following phenomena: - Transport of hot leg injected ECC water to the upper plenum or in the direction of steam generator, depending on the loop mass flow, - Utilization of the condensation potential of ECC water, - Mixing of the saturated water with the ECC water, - Effect of hot leg injection on the flow phenomena in the hot leg, - Effect of pressure (3 and 15 bar) on the scaling and hence the verification of the scaling concept applied. A preliminary evaluation of the test is presented in the Quick Look Report. (orig.)

15612 (WHC-SA–2633) **Snubber reduction analysis of secondary hot leg in Fast Flux Test Facility.** Chen, W.W.; Lindquist, M.R. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. (CONF-950740–8: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95006629. Source: OSTI; NTIS; INIS; GPO Dep.

This paper describes analyses to qualify the structural integrity of the secondary hot leg (SHL) dump heat exchanger(DHX) piping system of the Fast Flux Test Facility (FFTF) under seismic loading after the deletion of a number of seismic snubbers. A baseline geometric model was developed, with ADLPIPE computer code, Version 2EIA, 1984. Several seismic analyses were performed by iteration with the maximum number of snubbers reduced to obtain a support configuration having acceptable anchor and support loads as well as acceptable piping stresses. A thermal analysis was performed at an operating temperature of 965°F (518°C) to qualify the piping system following the replacement of some seismic snubbers with rigid supports. A series of displacements from flow- or pump-induced vibration were measured. These vibrations, on the order of tens of seconds or minutes apart, were not continuous and steady, but rather of a series of forced displacements that rapidly damped out to zero. A scoping evaluation of the effect of the vibration found that the calculated stress is within limits. Results of the stress analysis of the piping with snubber reduction are qualified in accordance with ASME, Section III, Class 1, requirements. Nearly 67% of the snubbers in loop 1 of the SHL piping system may be eliminated or replaced with rigid struts at the same location and orientation. The effects of inelastic strain accumulation, creep-fatigue damage and interaction, and elastic follow-up are evaluated by comparison to the results of inelastic analysis. Revised anchor and hanger loads also were evaluated by comparison to those from the original seismic analysis.

15613 (NREL/TP–441-7807) **HYBRID2 – A versatile model of the performance of hybrid power systems.** Green, H.J. (National Renewable Energy Lab., Golden, CO (United States)); Manwell, J. National Renewable Energy Lab., Golden, CO (United States). Apr 1995. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. (CONF-950309–1: 25. annual conference and exhibition on wind power, Washington, DC (United States), 26-30 Mar 1995). Order Number DE95004062. Source: OSTI; NTIS; GPO Dep.

In 1993, the National Renewable Laboratory (NREL) made an assessment of the available tools from the United States and Europe for predicting the long-term performance of hybrid power systems. By hybrid power the authors mean combinations of two or more power sources wind turbines, photovoltaics (PV), diesel gensets, or other generators into integrated systems for electric power generation in remote locations. Their conclusion was that there was no single, user-friendly tool capable of modeling the full range of hybrid power technologies being considered for the 1990s and beyond. The existing tools were, in particular, lacking flexibility in system configuration and in dispatch of components. As a result, NREL developed a specification for a model, called HYBRID2, for making comparisons of competing technology options on a level playing field. This specification was prepared with a range of potential users in mind including not only the US Department of Energy (DOE) renewable energy programs, but also the US wind industry, technical consultants, international development institutions/banks, and rural electrification programs in developing countries. During 1994, NREL and subcontractor, the University of Massachusetts (UMass), began development of HYBRID2 with funding from the DOE Wind Energy Program. It builds on the wind/diesel model, HYBRID1, developed previously by UMass, and expands that model to accommodate the wider array of technologies used in hybrid power systems. This paper will provide an overview of the model's features, functions, and status.

15614 (ORNL/TM–12619) **Bonneville Power Administration Communication Alarm Processor (CAP). Final report.** MacGregor, D.G. (MacGregor-Bates, Inc., Eugene, OR (United States)); Goeltz, R. Oak Ridge National Lab., TN (United States). Jan 1995. 44p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009656. Source: OSTI; NTIS; GPO Dep.

Power systems operations and maintenance currently face an ever-increasing need for a high level of computerized support. This paper is the final report of a research and development effort undertaken by the Bonneville Power Administration to develop a computerized decision support system to aid operations and maintenance personnel isolate and diagnose faults on a microwave communication system used for centralized dispatch operations. The system, called CAP for Communication Alarm Processor, provides statistical analysis of microwave communication system alarms, as well as an expert system capability for fault isolation and diagnosis. CAP is implemented on a DEC VAX Station 3100 computer, utilizing both knowledge-based programming principles as well as conventional programming techniques.

2402 Power System Networks, Transmission and Distribution

15615 (CONF-9505196–1) **Computer-aided coordination and overcurrent protection for distribution systems.** Tolbert, L.M. Oak Ridge National Lab., TN (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States);Institute of Electrical and Electronics Engineers, Inc., New York, NY (United States). DOE Contract AC05-84OR21400. From 1995 industrial and commercial power systems conference; San Antonio, TX (United States); 8-10 May 1995. Order Number DE95008844. Source: OSTI; NTIS; GPO Dep.

Overcurrent protection and coordination studies for electrical distribution systems have become much easier to perform with the emergence of several commercially available software programs that run on a personal computer. These programs have built-in libraries of protective device time-current curves, damage curves for cable and transformers, and motor starting curves, thereby facilitating the design of a selectively coordinated protection system which is also well-protected. Additionally, design time when utilizing computers is far less than the previous method of tracing manufacturers' curves on transparent paper. Basic protection and coordination principles are presented in this paper along with several helpful suggestions for designing electrical protection systems. A step-by-step methodology is presented to illustrate the design concepts when using software for selecting and coordinating the protective devices in distribution systems.

15616 (CONF-9407153–Vol.1, pp. 45-49) **Superconducting fault current limiter for power utility application.** Leung, E. (Martin Marietta Corp., Oak Ridge, TN (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

Recent accomplishments in the development of superconducting fault current limiters for power systems are outlined. These accomplishments include the comprehensive requirement for fault current limiters developed by SCE; down-selection; bridge concepts; shunt concepts; and high resistivity matrix substrates for HTS conductors. The proposed Phase II SPI-FCL Program is outlined. It is concluded that the SPI fault current limiter program will benefit both the power utility industry as well as the high temperature superconductivity community and progress of Phase I is right on target.

15617 (CONF-9407153–Vol.1, pp. 75-103) **HTS Wire Development Group: Achievements, technology transfer, and plans.** Riley, G.N. Jr. (American Superconductor Corp., Westborough, MA (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The objective of the HTS wire development group is to develop high performance HTS wire for use in electric power systems. The HTS wire development group personnel is listed. The HTS wire development group achievements are outlined. These achievements include: focusing on the development of high performance and cost effective HTS wire; HTS wires were fabricated in laboratory scale and production scale lengths; ACS has fabricated the only conductor in the world to meet or surpass the DOE FY94 goals for electric power applications development; these wire fabrication successes at ASC are a direct result of the long-term collaboration between ASC and the other HTS Wire Development Group members; and plans are in place for a successful FY95 program.

2404 Health and Safety

15618 (DOE/BP–1-9351) **Rules of conduct for persons entering substations: Green cross for safety.** USDOE Bonneville Power Administration, Portland, OR (United States). Mar 1995. 24p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009163. Source: OSTI; NTIS; GPO Dep.

This is a field orientation guide for unescorted entry and performance of work not affecting the electrical operation of the BPA power system. The mandatory rules express minimum requirements for dealing with the main hazards encountered in daily work activities. These and other written requirements must be continually reinforced on each assigned task through the safety judgments of each BPA and contractor worker.

15619 (NEI-DK–1952) **Magnetic fields at workplaces.** Lous, H. (ELKRAFT (Denmark)); Yde, K. Danske Elvaerkers Forening, Copenhagen (Denmark). Dec 1992. 11p. (In Danish). Order Number DE95772350. Source: OSTI; NTIS.

Summaries of a selection of available results found in relevant literature on the subject of occupational exposure to magnetic fields are presented. Information is also given as to which types of field employees are most often exposed. Limits given for exposure to magnetic fields with regard to employees are described and IRPA (International Radiation Protection Association) guidelines are given. The subjects of leukemia, brain and other forms of cancer are very briefly dealt with and exposure to magnetic fields with regard to persons working with electricity/industry, such as electricians at power stations and welders employed by shipbuilding firms are specifically and shortly dealt with. (AB)

2405 Environmental Aspects

Sponsored by USDOE, Washington, DC (United States). (DOE/BP–2544). Order Number DE95009169. Source: OSTI; NTIS; INIS; GPO Dep.

This document contains the appendices for the Bonneville Power Administration (BPA) Business Plan: Supplemental Draft Environmental Impact Statement. Included are: BPA products and services; Rate design; Methodology and assumptions for numerical analysis; Retail utility operations; Comments and responses to the draft business plan EIS.

2407 Economic, Industrial, and Business Aspects

15621 (INIS-mf–14486) **Prerequisites to promote energy efficiency investments in Bulgaria.** Boernsen, O. (Gopa Consultants (Germany)). No corporate text available. 1994. 6p. (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627083. Source: OSTI; NTIS (US Sales Only); INIS.

The PHARE Energy Programme's team observation and advice to the Committee of Energy in Bulgaria are outlined. In comparison to the Western European countries energy intensity in Bulgaria is 2-3 times higher. It is explained by the energy intensive industrial structure and the old and depreciated capital equipment. Cost-covering energy prices would make energy efficiency investment financially feasible and would attract financiers. But the lesson from Western European experience is that availability of finance capital and cost reflecting energy prices is not at all a necessary prerequisite for energy efficiency improvement. This improvement can be achieved with no cost or low cost measures. The potential for energy efficiency in industry (consuming more than 50% of the energy) is 11%-20%; in buildings - 6%; in transport - 4%. There are other obstacles, as lack of information, other business interests and no internal expertise, especially for small and medium size industries. The basic prerequisite to improve energy efficiency is raising of awareness and change of management culture, as well as radical change in organisational and management structures. (orig.).

15622 (INIS-mf–14490) **Efficient energy usage and creation of tariff policy for household and industrial sectors through**

remote control of distribution network. Vinchev, E. Komitet po Energetika, Sofia (Bulgaria). 1994. 5p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627084. Source: OSTI; NTIS (US Sales Only); INIS.

The advantages of the remote control of distribution network in market-oriented economic policy are stressed and the most important features of its main components are outlined. The author underlines the necessary changes in the Bulgarian electric power supply system aiming at improving energy usage efficiency, simplicity and transparency in customer relationships and decreasing peak power demand. This new network control approach will optimise the use of multi rate tariff power meters and pricing of electricity and will result in all loads being served at minimal total cost. An evaluation of the benefits and expenditures for applying such a system is given. The experience of the town of Varna with similar system developed at ABB ZPA Trutnov (Czech Republic) is described as a successful example of implementation of this technology. 1 fig. (orig.).

15623 (INIS-mf–14494) **Is the fuel and energy consumption in Bulgaria effective?.** Manoilova, T.; Popsavov, L.; Tsaleva, E. Energoproekt, Sofia (Bulgaria). 1994. 10p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627085. Source: OSTI; NTIS (US Sales Only); INIS.

Data on the difficult energy situation in Bulgaria for the period 1987-1992 are presented. The reasons for the drop in fuel and energy consumption and the corresponded decrease in GNP are discussed. The main contribution to the real decrease in gross national product (GNP) has the drop in surplus value of industry - 16.5 % in 1992 compared to 1991. As a result the relative share of industry in GNP decreases. The substantial drop of the surplus value in industry is due to the cutting of sales in the most important industrial branches. The drop in production leads to drop in consumption of primary and final energy sources by 11% in 1991-1992. The fuel/energy balance shows a dramatic decrease in gross consumption of primary energy resources. This is influenced in some degree by the decrease in consumption of imported primary energy resources, which dropped by 20 % in 1992. The consumed primary energy/fuel sources per unit GNP are changed for 1990-1991-1992 in relation 1-1.86-1.35. The sectoral analysis (industry, agriculture and services) shows a trend towards a strong increase in energy intensity per GNP. 6 tabs., 1 fig. (orig.).

15624 (INIS-mf–14495) **Short-term forecasting of thermal energy consumption based on neural net.** Minkov, Ts. Nauchno-Tekhnicheski Syyuz na Energetitsite, Sofia (Bulgaria). 1994. 6p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627086. Source: OSTI; NTIS (US Sales Only); INIS.

The optimal energy saving management of a district heating system requires forecasting of its main parameter - the thermal load. It is expressed in forecasting of the temperature scheduling and the thermal energy consumption. The author proposes an approach for short-term forecasting of the thermal energy consumption based on artificial neural network (ANN) methods. A back-propagation algorithm is used for the training process. The input layer of the network includes: 5 nodes for consumption profiles determining 24 discrete values of the load; 11 nodes for current and past temperature values; 4-5 nodes for forecast values of some parameters. The optimal network architecture determined by the Dynamic Node Creation method consists of 14 neurons in the 'hidden' layer. Archive data about the operation of the ZEMLYANE Heating Station (Sofia, BG) for a 5 month period are used as training facts. The network was tested on independent excerpt of data comprising a 7 day period. The average error at testing is about 1.5%. The model is developed by Neural Desk 2.11 for PC. The results of the tested cases look promising and confirm the validity of the ANN approach for solving the problems of energy load in heating systems. 1 tab., 3 figs., 5 refs. (orig.).

15625 (INIS-mf–14497) **Operational management of district heating system -artificial intelligence approach.** Sotirov, G.; Chonkov, I.; Penev, P.; Minkov, Ts. Vissh Massinno-Elektrotekhnicheski Inst., Sofia (Bulgaria). 1994. 13p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627087. Source: OSTI; NTIS (US Sales Only); INIS.

Solution of energy saving problems in the heating systems are based on the approaches of modern control theory. Some aspects of artificial intelligence (AI) have direct application in operational management of such kind of objects. The tasks as choice of equipment, distribution of the load between the parallel working units and short-term forecasting of the heat load are tackled. The solution of these tasks is carried out by integration of a knowledge base and artificial neuron networks in algorithms of mathematical programming. The possibilities for using the fuzzy logic apparatus for management of such objects are commented, as well as for development of an expert system. The studies are based on real operational data from ZEMLYANE Heating System, Sofia (BG). 20 refs., 3 figs., 1 tab. (orig.).

15626 (INIS-mf–14498) **Aspects of marginal expenditures in energy sector.** Stojchev, D.; Kynev, K. Energokibernetika Ltd., Sofia (Bulgaria). 1994. 6p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627088. Source: OSTI; NTIS (US Sales Only); INIS.

Technical and economical problems of marginal analysis methodology, its application procedure in energy sector and marginal expenditures determination are outlined. A comparative characteristics of the application is made for different periods of time. The differences in calculation of the marginal expenditures and prices are discussed. The operational costs, investments and inflation are analyzed. The mechanism of application of this approach in different planing horizon is outlined. The role of the change in the costs in time, the time unit, volume, the scope of application, etc. are determined. The areas of transition from one to other form of marginal expenditures are shown. 4 refs. (orig.).

15627 (INIS-mf–14499) **Restructuring and privatization in energy sector.** Stojchev, D.; Pyrvanov, V. Energokibernetika Ltd., Sofia (Bulgaria). 1994. 7p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627089. Source: OSTI; NTIS (US Sales Only); INIS.

The ways of solving problems of the transition period to market economy are discussed. The current conditions in Bulgarian energy sector are defined taking into account different processes, stages, elements, objects. The criteria of the transition -economical. technological, organizational, social, ecological -and the problems - unemployment, requalification, privatization, contamination - are postulated. The recent experience of Bulgaria and other ex-communist countries in restructuring and privatization of the economy are considered. The scope of suitable approaches, methods, means and rates are outlined. The mechanisms of the tackled processes are analyzed by comparative investigation and management ways for impact on different levels are looked for. The possible consequences of given situation, advantages and shortcomings of different alternatives are formulated. The ways for assessment and selection of compromise solutions are proposed. An overall technology for assessment and application of different ways of transition is discussed. Their tools for business estimation of economic units, the legislative, economic and social aspects of the process are scrutiny observed. Some problems of a real example of application of proposed assessment are discussed. Conclusions about methodology and efficiency of different alternatives are made. 2 refs.

15628 (INIS-mf–14502) **PHARE Energy Program for Bulgaria - restructuring and energy efficiency.** Yurukov, I.; Stariradev, V. Komitet po Energetika, Sofia (Bulgaria). 1994. 16p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627090. Source: OSTI; NTIS (US Sales Only); INIS.

The assistance of European Community and the G7 countries in the framework of the PHARE program in Bulgaria began in 1990 and till now three indicative programs for overall value of Ecu 275 million are signed. The Project Management Group (PMG) in the field of conventional energy sources was created in 1992 which is responsible for coordination of the projects and their financing by

foreign governmental and non-governmental organizations. The main part of the projects are devoted to organization of energy policy, energy saving and energy efficiency, utilization of domestic lignite, domestic usage of gas, improvement in power generating systems, optimization of district heating systems, assessment of renewable energy sources, adaptation of energy sector to the requirements of market economy. A detailed description is given to the aims, main tasks, expected results and current status of the particular sub projects. 5 refs.

15629 (ANL/ET/CP–84445) **Competition between SMES and flywheels.** Hull, J.R. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9410238–2: International Energy Agency symposium on the use of superconductivity in energy storage, Karlsruhe (Germany), 25-27 Oct 1994). Order Number DE95005834. Source: OSTI; NTIS; GPO Dep.

The benefits of flywheel energy storage using high-temperature superconducting bearings is compared to that of SMES for the same applications. Flywheels cover the same range of energy storage times as SMES but their scaling relationships make them inherently more amenable to modular manufacture. In addition, the magnetic fields seen by the environment are considerably reduced for flywheels.

2504 Capacitor Banks

EFP-92.

Specific capacitance and internal resistance of selected carbons have been measured with different electrolytes. A maximum value of 80 F/g has been obtained. The internal resistance depends mainly on the ionic conductivity of the electrolyte. Chemical or physical pretreatments had no positive influence on the electrochemical properties of activated carbons, except of carbon blacks. In our experimental conditions, the maximum nominal voltage is between 2.5 and 3 V. The theoretical maximum power density (without packaging and connection) of these carbons with a high conducting electrolyte (1.4 10-2 S/cm) is close to 3 kW/l. Significant progress has been made in terms of energy and power densities for the last generation of Innovision supercapacitors, but their characteristics remain for the moment lower than those obtained with liquid electrolytes. Problems of collector corrosion, electrode percolation and carbon wettability have to be solved. (au)

(Argonne National Lab., IL (United States)); Hammel, C.; Altemos, E.A. Argonne National Lab., IL (United States). Dec 1994. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-941221–3: 12. International electric vehicle symposium, Anaheim, CA (United States), 5-7 Dec 1994). Order Number DE95009908. Source: OSTI; NTIS; GPO Dep.

In 1990, the Electric and Hybrid Propulsion Division of the US Department of Energy established its ad hoc EV Battery Readiness Working Group to identify regulatory barriers to the commercialization of advanced EV battery technologies and facilitate the removal of these barriers. A Shipping Sub-Working Group (SSWG) was formed to address the regulatory issues associated with the domestic and international shipment of these new battery technologies. The SSWG invites major industrial developers of advanced battery technologies to join as members and work closely with appropriate domestic and international regulatory authorities to develop suitable regulations and procedures for the safe transport of these new battery technologies. This paper describes the domestic and international regulatory processes for the transport of dangerous goods; reviews the status of shipping regulations for sodium-beta and lithium batteries; and delineates the lessons learned to date in this process. The sodium-beta battery family was the first category of advanced EV batteries to be addressed by the SSWG. It includes both sodium/sulfur and sodium/metal chloride batteries. Their efforts led to the establishment of a UN number (UN 3292) in the UN Recommendations, for cold cells and batteries, and establishment of a US Department of Transportation general exemption (DOT-E-10917) covering cold and hot batteries, as well as cold cells. The lessons learned for sodium-beta batteries, over the period of 1990–94, are now being applied to the development of regulations for shipping a new generation of lithium battery technologies (lithium-polymer and lithium-aluminum/iron sulfide batteries).

29 ENERGY PLANNING AND POLICY

The work reported in the present communication is based on several years of consultancy to the OECD regarding the methodology of life-cycle analysis, followed by implementation studies performed for the Danish Department of Energy and as a contractor for the Fuel Cycle Externality Project of the European Community Joule II Programme. The work also underlies the author's work as a member of the IPCC (Intergovernmental Panel on Climate Change) working group II and consultant to working group III. (au) (22 refs.)

15633 (NEI-DK–1910, pp. 11-32) **Sustainable development as a planning goal for energy systems in the Nordic and Baltic area.** Halsnaes, K. (Risoe National Laboratory, Systems Analysis Department, roskilde (Denmark)); Morthors, P.O. Copenhagen Univ. (Denmark). Oekonomisk Inst. Mar 1994. (CONF-9011345–: Workshop on economics of the environment, Copenhagen (Denmark), 14-15 Nov 1990). In *Environmental economics and the Baltic region.* 170p. Order Number DE95766547. Source: OSTI; NTIS.

Energy consumption and production are important contributors to environmental problems on a global, regional and local geographical scale. Furthermore, the management of energy systems involves some interesting resource economic problems. The environmental impact of the energy system and the resource management problem can be handled in an integrated way within a concept of sustainable energy development. This concept is described in more detail in the following, and some results for Denmark and the Nordic-Baltic area are reported. (au) (10 refs.)

In the transition process to modern societies Estonia, Latvia and Lithuania faces serious problems in all sectors. Old centralized organizations are being broken down and new structures are being build. In this time of transformation energy problems must be given high priority because the present situation with high energy imports makes the countries very vulnerable to events in other countries, and because the burning of fossil fuels on old equipment without cleaning facilities are responsible for the major part of emissions of environmentally damaging pollutants such as (SO_2, NO_x, CO_2...). Many of these pollutants are transboundary and the problems must therefore be solved by international collaboration. (au)

15635 (ANL/EA/CP–85788) **Training implications of skills needed for environmental cleanup.** Young, C. (Argonne National Lab., IL (United States)); Hensley, J.; Lehr, J. Argonne National Lab., IL (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9409328–1: Annual meeting of the North American Association for Environmental Education, Cancun (Mexico), 23-27 Sep 1994). Order Number DE95008301. Source: OSTI; NTIS; GPO Dep.

Well-trained staff are needed to perform the diverse tasks associated with environmental cleanup. Although educational and training programs are intended to help professionals learn relevant environmental skills, these programs may or may not be teaching the most appropriate skills. This project investigated the skills needed to carry out environmental activities at a headquarters office of a federal agency. The primary skills needed for environmental cleanup activities emphasize program management, problem solving/critical thinking, and communications. Furthermore, using Bloom's taxonomy of educational objectives, most of these skills fell into the areas of "application" or "evaluation." The results of this investigation suggest that rather than focusing on discipline-specific activities, such as helping improve people's knowledge about regulatory requirements, training and education should emphasize complex problem-solving skills.

15636 (ANL/EAIS/PP–80565) **Factors affecting minority population proximity to hazardous facilities.** Nieves, L.A. (Argonne National Lab., IL (United States)); Nieves, A.L. Argonne National Lab., IL (United States). [1995]. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95009907. Source: OSTI; NTIS; GPO Dep.

Disproportionate exposure of minority groups to environmental hazards has been attributed to "environmental racism" by some authors, without systematic investigation of the factors underlying this exposure pattern. This study examines regional differences in the proximity of African-Americans, Hispanics, Asians, and non-Hispanic Whites to a broad range of facility types and explores the effects of urban and income factors. A statistically significant inverse relationship is found between the percentage of non-Hispanic Whites and virtually all facility categories in all regions. Except for Hispanics in the South, all such associations for minority groups show a direct relationship, though some are nonsignificant. The geographic concentration of facilities is more closely tied to urbanization than to economic factors. Controlling for both urban and economic factors, minority population concentration is still a significant explanatory variable for some facility types in some regions. This finding is most consistent for African-Americans.

15637 (DOE/EP/10050–T3) **Energy Investment Advisory Series No. 2. Investment opportunities in Indochina's energy sector.** Hagen, R.E. East-West Center, Honolulu, HI (United States). Dec 1994. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-93EP10050. Order Number DE95008743. Source: OSTI; NTIS; GPO Dep.

Indochina is well positioned to join Asia's recent record of impressive economic growth. Vietnam, with the largest population and its long coast, seems poised to be the first nation in Indochina to succeed. It, and to a lesser extent Laos and Cambodia, are well positioned to take advantage of future tends in energy and energy-related markets. Electricity, hydro, renewables and nuclear are discussed as well as oil and gas. Areas of the energy industry in which investment might be possible in each country are tabulated.

15638 (NEI-DK–1910, pp. 33-42) **Economic interpretation of sustainable development.** Birk Mortensen, J. (Copenhagen Univ., Inst. of Economics, Copenhagen (Denmark)). Copenhagen Univ. (Denmark). Oekonomisk Inst. Mar 1994. (CONF-9011345–: Workshop on economics of the environment, Copenhagen (Denmark), 14-15 Nov 1990). In *Environmental economics and the Baltic region.* 170p. Order Number DE95766547. Source: OSTI; NTIS.

The economic discussion of sustainable development show that it is possible to define the concept sufficiently precise to introduce it in economic models and to get some policy results. The concept of sustainable development does have meaning and practical implications for economic policy. The relation between sustainability as non-decreasing welfare over time and a non-declining stock of total capital including natural capital is very useful for implementing the concept for actual planning. Even rudimentary empirical measures and test of sustainability can be developed and applied and used in planning and evaluation of performance based on this idea. Weak or strong versions of the concept have been suggested and an interesting and clarifying debate within economics is going on. The debate also demonstrates that when the concept is defined more precisely - differences in opinions, standpoints and policy prescriptions show up. (EG)

15639 (NEI-DK–1910, pp. 43-53) **Environmental policy in (former) centrally planned economics. A Polish perspective.** Zylicz, T. (Polish Ministry of Environemntal Protection, Economics Department (Poland)); Sleszynski, J. Copenhagen Univ. (Denmark). Oekonomisk Inst. Mar 1994. (CONF-9011345–: Workshop on economics of the environment, Copenhagen (Denmark), 14-15 Nov 1990). In *Environmental economics and the Baltic region.* 170p. Order Number DE95766547. Source: OSTI; NTIS.

The aim of the paper is to identify the general causes of poor environmental performance of the European non-market economies and to discuss ways of its improvement. Poland's experiences are emphasized although most conclusions apply to any centrally planned economy. Former centrally planned economies constitute extremely non-homogeneous group and include Bulgaria, Czechoslovakia, Eastern part of Germany, Hungary, Poland, Romania and the Soviet Union. Moreover, the description 'former' in many cases appears still a wishful thinking only of the authors. The authors argue that the failure can not be explained in terms of system inefficiency exclusively. In addition to resource administrative allocation effect environmental abuse here has its policy roots as well. Despite their clear ineffectiveness the environmental policy favored emission charges rather than alternative non-financial instruments. There is an obvious tendency to adhere to this approach especially now and to wait until it allegedly produces right results in the new market context. The authors point out that administrative solutions in environmental policy are widely used by the OECD governments and that there is a every reason to use them in the reformed economies of Eastern Europe. This does not exclude an application of taxes or effluent charges. Moreover, this does not preclude developing transferable permits and permit markets wherever appropriate. (au) (14 refs.)

15640 (NEI-DK–1910, pp. 93-100) **The economic incentive of pollution control charges. Exceptions to the 'rule'.** Ugelow, J. (The Aarhus School of Business, Aarhus (Denmark)). Copenhagen Univ. (Denmark). Oekonomisk Inst. Mar 1994. (CONF-9011345–: Workshop on economics of the environment, Copenhagen (Denmark), 14-15 Nov 1990). In *Environmental economics and the Baltic region.* 170p. Order Number DE95766547. Source: OSTI; NTIS.

The simplistic picture of charges, which is often taken as the rule in determining of minimum cost solution to pollution control issues, misleads policymakers by making the use of charges seem flexible and reversible. Four potentially significant factors have been

offered as reasons why the firm will not be motivated to act according to popular theory. The first factor is that the firm in making an investment, which involves fixed costs, will not respond to a change in the charge value independent of this investment. The second factor is that the firm may choose to build in flexibility to any investment so that if charges change, the firm can alter pollution reduction accordingly. the third factor is that the firm is making choices between different kinds of technology which are operative over range. The fourth factor is that the firm values its investments according to actual costs and not opportunity costs and so may not choose to invest in pollution control if capital rationing points to a more profitable, competing investment. At this point, not enough analysis has been done to determine if the charge is still the most cost-effective way of treating pollution problems. It has been shown that the use of these 'economic incentives' are complicated. (EG)

15641 (NEI-DK–1963) **Integrated resource planning in Danish electricity supply.** Jysk-Fynske Elsamarbejde (ELSAM), Fredericia (Denmark); ELKRAFT A.m.b.A., Ballerup (Denmark). 1994. 34p. Order Number DE95772390. Source: OSTI; NTIS; INIS.

Also published in Danish.

Integrated Resource Planning in Danish Electricity Supply is a development project run by a cooperation of Danish electric power companies. It takes environmental issues, such as energy conservation, into consideration in addition to the European Union's proposal for a directive on the introduction of competition within the common energy market. The concept of integrated resource planning is described as a tool that can be used for a total cost minimization of the activities on the supply side and the demand side, this concept is further elucidated. It is explained that there must be an economic balance between the efforts on both sides and that this will ensure a total cost minimization. Preconditions, related for example to socio-economics, and procedures (step-by-step planning), functional barriers, a definition of roles and international influence and dialogue are also discussed. Satisfaction is expressed for this method of integrated resource planning, yet uncertainty as to the future structure of the free electricity market implies a cautious implementation. (AB)

15642 (SAND–95-0435C) **The impact of technology on the economy.** Rogers, J.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506145–1: 1995 Society for Experimental Mechanics spring conference, Grand Rapids, MI (United States), 12-14 Jun 1995). Order Number DE95008522. Source: OSTI; NTIS; GPO Dep.

This paper discusses, in a general way, the influence of technology on the economy. The target audience is engineers who are involved in technology development but who are not especially familiar with economics. The measure used for describing the health of an economy is productivity. The impact of technological developments on productivity is discussed.

15643 (UCRL-ID–119696) **A cross-cultural mentoring program.** Huang-Nissen, S.; Myers, R.Y. Lawrence Livermore National Lab., CA (United States). [1995]. 30p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95009460. Source: OSTI; NTIS; GPO Dep.

This report summarized the results of the pilot Cross-Cultural Mentoring Program at Lawrence Livermore National Laboratory, from the inception of the program idea through its implementation and assessment. It discusses the benefits of mentoring, the origins of the program, program design and implementation, program assessment, and conclusions and recommendations.

15644 (Y/TS–1196) **Are self-directed work teams successful and effective tools for today's organization?.** Arnwine, A.D. Oak Ridge National Lab., TN (United States). Mar 1995. 35p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009055. Source: OSTI; NTIS; GPO Dep.

The purpose of this research is to (1) show the effectiveness and success of self-directed work teams within the organization, (2) emphasize the importance of team building in the success of the team, and (3) assist organizations in building self-directed work teams. The researcher used a direct survey and studied the following team building techniques: (1) Is the team's mission clearly defined to each team member? (2) Are the goals clearly defined and achievable by all team members? (3) Will empowerment (decision-making power) be given equally to all team members? (4) Will open and honest communication be allowed among team members? (5) Will each team member be respected and valued for his/her position on the team? (6) Are self-directed work teams effectively rewarded for accomplishments? (7) Have team members received adequate training to effectively complete their job tasks? Upon completion of the literature review and statistical data, and after analyzing the seven areas of team building techniques, it was determined three of the four teams were successful and effective. The only area of concern to the organization is that the participants felt they did not have true ownership of their teams; that is, team members were not given full empowerment. According to this study and the review of literature, full empowerment must be given to achieve successful and effective teams. If true empowerment is not given, the team will suffer in other areas of team building, and the organization will lose a valuable tool.

15645 (ANL/EA/CP–84258) **Accelerating RCRA corrective action: The principles of the DOE approach.** Kimmell, T.A. (Argonne National Lab., IL (United States)); Green, D.R.; Ranek, N.L.; Coalgate, J.L. Argonne National Lab., IL (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950216–110: Waste management '95, Tucson, AZ (United States), 26 Feb - 2 mar 1995). Order Number DE95008287. Source: OSTI; NTIS; INIS; GPO Dep.

The US Department of Energy (DOE) is involved in the remediation of environmental contamination at many of its facilities under the Resource Conservation and Recovery Act (RCRA). RCRA's corrective action provisions were established by the Hazardous and Solid Waste Amendments of 1984 (HSWA). In response to the HSWA mandate, EPA established a program for the conduct of RCRA corrective action that was similar to that established under the Comprehensive Environmental Response Compensation and Liability Act (CERCLA). In addition, EPA developed and implemented its "stabilization" initiative as a means of quickly addressing immediate risks posed by releases until long term solutions can be applied. To improve the efficiency of environmental restoration at its facilities, DOE is developing guidance and training programs on accelerated environmental restoration under RCRA. A RCRA guidance document, entitled "Accelerating RCRA Corrective Action at DOE Facilities," is currently being developed by DOE's Office of Environmental Policy and Assistance. The new guidance document will outline a decision-making process for determining if acceleration is appropriate for individual facilities, for identifying, evaluating, and selecting options for program acceleration, and for implementing selected acceleration options. The document will also discuss management and planning strategies that provide a firm foundation for accelerating RCRA corrective action. These strategies include a number of very basic principles that have proven effective at DOE and other federal facilities, as well as some new approaches. The purpose of this paper is to introduce DOE's new guidance document, discuss the general approach presented in the guidance for accelerating RCRA corrective action, and to emphasize some of the more important principles of effective management and planning.

15646 (CONF-950216–120) **An expert system for enhancing compliance with hazardous materials packaging and transportation regulations.** Ferrada, J.J. (Oak Ridge National Lab., TN (United States)); Michelhaugh, R.D.; Pope, R.B.; Rawl, R.R.; Thomas, T.M. Oak Ridge National Lab., TN (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From Waste management '95; Tucson, AZ (United States); 26 Feb - 2 mar 1995. Order Number DE95010284. Source: OSTI; NTIS; INIS; GPO Dep.

The Hazardous Material Expert System (HaMTES) was developed at ORNL in order to provide a computerized expert system which is easy to use, will provide straightforward and consistent application of the hazardous material transportation regulations, and will reduce the potential for human error in applying the regulations to both packaging and transportation of hazardous material activities. The system's proof-of-concept was demonstrated using the radioactive material regulations and then expanded to include regulations for all hazardous materials. It incorporates as much as possible multi-media capabilities, for accessing A/V demonstrations of explanations and applications of regulations, descriptions of package designs, and actual loading and preparation for shipment of specific package designs. Coupling of HaMTES to other transportation operations management software is underway and methods for maintaining and upgrading the program developed. Details of the capabilities of HaMTES, its computer hardware requirements, and plans for implementing HaMTES within the DOE shipping community are presented in this paper.

15647 (DOE/EA–1026) **Environmental Assessment for the sewage lagoon system: Area 5, Nevada Test Site.** USDOE Nevada Operations Office, Las Vegas, NV (United States). Feb 1995. 22p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009936. Source: OSTI; NTIS; INIS; GPO Dep.

The DOE Nevada Operations Office prepared an environmental assessment (EA), (DOE/EA-1026), to evaluate the potential impacts of constructing a sanitary waste sewage lagoon system in Area 5 at the Nevada Test Site (NTS). The proposed system would replace an existing septic system. Based on the information and analyses in the EA, DOE has determined that the proposed action would not constitute a major federal action significantly affecting the quality of the human environment within the meaning of the National Environmental Policy Act of 1969 (42 USC 4321 et seq.). Therefore, an environmental impact statement (EIS) is not required and DOE is issuing this FONSI.

15648 (DOE/EA–1032) **Environmental assessment for the upgrade of the site road infrastructure on the Savannah River Site.** USDOE Savannah River Operations Office, Aiken, SC (United States). Feb 1995. 21p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009935. Source: OSTI; NTIS; INIS; GPO Dep.

Four of the 17 bridges at the SRS need to be replaced. Principal impact of the proposed action would be the loss of 0.3 ha of wetland area and potential for erosion/sediment transport into SRS streams and waterways, although the latter would be minimized. A floodplain/wetlands assessment was prepared in compliance with 10 CFR Part 1022 and Executive Order 11990 for wetland protection. DOE has determined that the proposed action does not constitute a major Federal action significantly affecting the quality of the human environment with the meaning of NEPA; therefore, an environmental impact statement is not required and DOE is issuing this FONSI and Floodplain Statement of Findings.

15649 (DOE/EA–1046) **Environmental assessment for the construction, operation, and closure of the solid waste landfill at the Paducah Gaseous Diffusion Plant, Paducah, Kentucky.** USDOE Oak Ridge Operations Office, TN (United States). Mar 1995. 55p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009931. Source: OSTI; NTIS; INIS; GPO Dep.

DOE has prepared an environmental assessment (EA) for the proposed construction, operation, and closure of a Solid Waste Landfill (SWL) that would be designed in accordance with Commonwealth of Kentucky landfill regulations (401 Kentucky Administrative Regulations Chapters 47 and 48 and Kentucky Revised Statutes 224.855). PGDP produces approximately 7,200 cubic yards per year of non-hazardous, non-radioactive solid waste currently being disposed of in a transitional contained (residential) landfill cell (Cell No. 3). New Kentucky landfill regulations mandate that all existing landfills be upgraded to meet the requirements of the new regulations or stop receiving wastes by June 30, 1995. Cell No. 3 must stop receiving wastes at that time and be closed and capped within 180 days after final receipt of wastes. The proposed SWL would occupy 25 acres of a 60-acre site immediately north of the existing PGDP landfill (Cell No. 3). The EA evaluated the potential environmental consequences of the proposed action and reasonable alternative actions. Based on the analysis in the EA, DOE has determined that the proposed action does not constitute a major Federal action which will significantly affect the human environment within the meaning of the National Environmental Policy Act of 1969 (NEPA), 42 USC 4321 et seq. Therefore, it is determined that an environmental impact statement will not be prepared, and DOE is issuing this FONSI.

15650 (DOE/ER/61721–1) **Integrative assessment of mitigation, impacts, and adaptation to climate change.** Nakicenovic, N. (ed.) (International Inst. for Applied Systems Analysis, Laxenburg (Austria)); Nordhaus, W.D. (ed.); Richels, R. (ed.); Toth, F.L. (ed.). International Inst. for Applied Systems Analysis, Laxenburg (Austria). May 1994. 661p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States);National Science Foundation, Washington, DC (United States);Yale Univ., New Haven, CT (United States);International Inst. for Applied Systems A DOE Contract FG02-93ER61721. (CONF-9310415–: Integrative assessment of mitigation, impacts, and adaptation to climate change, Laxenburg (Austria), 13-15 Oct 1993; CP–94-9). Order Number DE95008168. Source: OSTI; NTIS; GPO Dep.

The Intergovernmental Panel on Climate Change (IPCC), representing the analysts who perform the assessments and the political system which commissions them, together with the International Institute for Applied Systems Analysis (ITASA), organized the first international workshop to focus on the comparative assessment of mitigation of climate change and on its potential impacts and adaptation strategies (1–2 September 1992). One of the key findings of this workshop was the need for integrated assessment. Numerous models and less formalized approaches analyze anthropogenic sources of greenhouse gas emissions, their concentrations in the atmosphere, the resulting climate forcing, impacts of the induced climate change on the economy and other human activities, as well as possible mitigation and adaptation strategies. Studies that include all or several of these salient aspects of the climate change problem are known as integrated assessments. Subsequently, IPCC included integrated assessment in its Working Group III that deals with economic questions and cross-cutting issues. One year after the first workshop IIASA convened a second workshop (13–15 October 1993), specifically to review the current practice of integrated assessments, directions for improvement and further research, and implications for climate change policies. This volume presents the proceedings of the 1993 workshop. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

15651 (DOE/PC/94227–T2) **Environmental impacts of ocean disposal of CO_2. 2nd quarterly report, October 1, 1994–December 31, 1994.** Tester, J.W.; Adams, E.E. Massachusetts Inst. of Tech., Cambridge, MA (United States). Energy Lab. [1995]. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-94PC94227. Order Number DE95010363. Source: OSTI; NTIS; GPO Dep.

This report summarizes progress in considering the environmental impacts of marine disposal of carbon dioxide. Calculations are being subcontracted to SAIC. In addition, administrative aspects of the project are discussed and technical presentations in the last quarter are summarized.

15652 (FEMP–2401) **CERCLA and RCRA requirements affecting cleanup of a hazardous waste management unit at a Superfund site: A case study.** Walsh, T.J. Fernald Environmental Restoration Management Corp., Cincinnati, OH (United States). Mar 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC24-92OR21972. (CONF-950646–13: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95009553. Source: OSTI; NTIS; INIS; GPO Dep.

The Fernald Environmental Management Project (FEMP) attempted to address both RCRA and CERCLA requirements at the fire training facility (FTF) by integrating a CERCLA removal action work plan with a RCRA closure plan. While the regulatory agencies involved with the FTF cleanup agreed the integrated document was a good idea, implementation proved complicated, owing to

disposition of clean debris from a Superfund site, treatment of contaminated media, duration of cleanup activities, and cleanup certification. While all the complications have not been resolved, solutions to all have been proposed to Ohio EPA and U.S. EPA. Both agencies have worked closely with FEMP to find the most effective fulfillment of RCRA and CERCLA requirements.

15653 (IEE-SR–257) **Economical analysis relating to the global warming issue.** Institute of Energy Economics, Tokyo (Japan). Aug 1994. 220p. (In Japanese). Order Number DE95764072. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

An analysis using global macro economic models is conducted on how to think and cope with the global warming issue from political and economic aspects. As viewpoints of evaluation, cited are cost estimation for the CO2 emission control, damage caused by the global warming and its economic evaluation, and the catastrophic effects on the ecosystem except the economic evaluation. Cline says that maximum efforts should be exerted to suppress CO2 emission to the level of 1990 by the year of 2000. It is said that to confirm how serious greenhouse effects will be in 2000, it is necessary to concentrate on scientific researches, and that the international society should make its second-stage determination in terms of freezing or reducing the level of 2000, or admitting that the level will go upward. For this, the economic distortion should be removed by removing assistance to fossil fuels step by step. Assistance to developing countries and economical efficiency should be raised by introducing the carbon tax. Improvement of efficiency and arrangement of incentives are required for individual technologies. Measures for forest preservation are necessary under the financial assistance program, etc. 34 figs., 36 tabs.

15654 (IMFUFA–291) **1. annual report from the project life-cycle analysis of the total Danish energy system. An example of using methods developed for the OECD/IEA and the US/EU fuel cycle externality study.** Soerensen, B. Roskilde Universitetscenter (Denmark). Inst. for Studiet af Matematik og Fysik samt deres Funktioner i Udervisning, Forsning og Anvendelser. 1995. 96p. Contract ENS-1753/94-0001. Order Number DE95766518. Source: OSTI; NTIS.

EFP-94.

The aim of the project is to identify the state of art as regards life-cycle analysis of energy systems and to apply it to the current Danish energy system as well as to two scenarios for mid-21st century energy systems. Work has concentrated on identifying the scenarios to be explored, and on collecting the externality data from the European Union (EU) project and other sources, with a view to their applicability under Danish conditions. During 1995, it is expected that further impact data will be gathered, and that the scenarios will be tested by simulation models, in order to ascertain their internal consistency. A brief outline of the work performed in 1994 is given in addition to an account of the life-cycle method and presentation of key results of externality studies abroad and in Denmark, with emphasis on the 'ExternE' results related to the coal, nuclear and wind cycles. The scenarios selected for the Danish application are presented, based on work performed for the Danish Technology Council. A conference paper containing presentation of the renewable energy scenario of the Danish Technology Council is included. (AB)

15655 (LA-UR–95-187) **Reaction chemistry of nitrogen species in hydrothermal systems: Simple reactions, waste simulants, and actual wastes.** Dell'Orco, P.; Luan, L.; Proesmans, P.; Wilmanns, E. Los Alamos National Lab., NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950284–2: 1. international workshop on supercritical water oxidation, Jackson, FL (United States), 6-9 Feb 1995). Order Number DE95006328. Source: OSTI; NTIS; INIS; GPO Dep.

Results are presented from hydrothermal reaction systems containing organic components, nitrogen components, and an oxidant. Reaction chemistry observed in simple systems and in simple waste simulants is used to develop a model which presents global nitrogen chemistry in these reactive systems. The global reaction path suggested is then compared with results obtained for the treatment of an actual waste stream containing only C-N-0-H species.

15656 (NEDO-GET–9306) **Investigations on trends in research and development on global environmental problem technologies at universities and other organizations.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 296p. (In Japanese). Order Number DE95769807. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

With an objective to effectively promote the research and development on global environment industrial technologies, investigations have been carried out on research and development activities at universities and national research institutes. The investigations were carried out by referring to and collecting literatures published by Japan Information Center of Science and Technology, theses announced by academic and industrial societies, and annual reports of research institutes. In relation to the global warming problem, technologies and researches using influence estimation by means of carbon circulation models were as many as accounting for about 40% of the total references. A large number of researches on preventive measures are carried out at universities, such as CO2 fixation. Also academic and theoretical researches are seen in a great number as represented by simulations for elucidating warming mechanisms. In the national research organizations, water-quality and soil maintenance technology accounts for 20% of the whole research, and researches are active on waste water treatment and harmful substance treatment by means of biological technologies. Reduction of NOx emission from diesel engines and refuse disposing technologies are also included in the researches. The possibility of new seeds includes CO2 fixation by using CO2 separating membranes and reactive electrodes, removal of air pollutants through photo-catalysts, and decomposition of harmful substances by means of catalysts and microorganisms. 10 refs., 11 figs., 25 tabs.

15657 (NEDO-GET–9308) **Technical innovation for reducing emissions of greenhouse effect gas and survey of effects of changes of industrial structures.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 245p. (In Japanese). Order Number DE95769808. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

The paper evaluates energy utilization efficiency and recycling potential in the industrial sector. Energy conservation in the commercial/residential sector is effective for improvement of energy efficiency of space heating and cooling. In the business sector, heat insulated structure of buildings is increasing, as well as increasing efficiency of heating facilities. In the passenger sector, energy conservation of automobiles is increasing. In the iron and steel industry, energy conservation of 20% was achieved. However, future recovery of exhaust energy needs technical development. The cement industry treats waste from other industrial sectors, aiming at energy conservation. Energy conservation in the petrochemical industry is mainly a combination of process rationalization and increasing of production ability. The electric utility industry tackles the energy conservation issue from the supply/demand aspect. In the town gas industry, energy conservation is promoted by improvement of energy conversion efficiency and utilization of LNG cold energy. For reference, attached are reports of the Intergovernmental Panel on Climate Change (IPCC). 50 figs., 17 tabs.

15658 (NEI-DK–1910) **Environmental economics and the Baltic region.** Birk Mortensen, J. (ed.). Copenhagen Univ. (Denmark). Oekonomisk Inst. Mar 1994. 170p. (CONF-9011345–: Workshop on economics of the environment, Copenhagen (Denmark), 14-15 Nov 1990). Order Number DE95766547. Source: OSTI; NTIS; INIS.

This volume originates from a workshop on Economics of the Environment held at the Institute of Economics, Copenhagen University, November 14-15, 1990 with participants from Lithuania, Estonia, Poland, Finland, Sweden and Denmark. The volume contains the papers presented at the workshop. In all the countries around the Baltic Sea there has been an increasing understainding

of the importance of using the economic incentive approach to reach environmental goals. By changing the incentives an individual producer or consumer faces, the best private choice can be made to coincide with the best social choice. All the countries around the Baltic Sea have used direct regulation or command and control in environment regulation. Growing concern about environmental degradation, dissatisfaction with the command and control approach and the need to extend environmental regulation to sectors with a large number of small producers or consumers have increased attention to economic instruments in environmental policy. The Baltic sea is an almost coherent ecological system and there is a growing interest in addressing common environmental problems among the countries around the Baltic Sea. The recent political development offer new possibilites for cooperation in environmental policy. This is important because many environmental problems in the region require solutions involving several countries. (EG)

15659 (NEI-DK–1910, pp. 63-69) **Environmental policy - a Baltic perspective.** Raju, O. (Tartu University, Department of Economics, Tartu (Estonia)). Copenhagen Univ. (Denmark). Oekonomisk Inst. Mar 1994. (CONF-9011345–: Workshop on economics of the environment, Copenhagen (Denmark), 14-15 Nov 1990). In *Environmental economics and the Baltic region.* 170p. Order Number DE95766547. Source: OSTI; NTIS.

It is common knowledge that the environmental policy of a country must proceed from the current political and economic situation. At present, the three Baltic states striving to regain their independence are in a rather complicated condition both economically and politically, as well as ecologically. Owing to that, the application of any definite environmental policy is impeded. At the same time, quick and efficient measures are badly needed in order to improve matters thoroughly in a considerably short period. In what follows we shall mostly confine ourselves to Estonia, however, the most important problems being similar in all the Baltic republics, we shall at times take a glance at Latvia and Lithuania, too. (au)

15660 (NEI-DK–1910, pp. 111-119) **Public participation in water management planning.** Kosola, M. (National Board of Waters and Environment, Helsinki (Finland)). Copenhagen Univ. (Denmark). Oekonomisk Inst. Mar 1994. (CONF-9011345–: Workshop on economics of the environment, Copenhagen (Denmark), 14-15 Nov 1990). In *Environmental economics and the Baltic region.* 170p. Order Number DE95766547. Source: OSTI; NTIS.

National Board of Waters and Environment is responsible for comprehensive planning of water resources management, water pollution control, combating of oil spills, development of flood control and sewage systems, promotion of the recreational use of water bodies and, for monitoring, supervision and research concerning Finland's national water resources. Water pollution problems in the area are caused by non-point sources as agriculture, forestry and fur production. This is mainly because of the utilization of certain fertilizers as well as loading caused by the fur production. Forest drainage, acidification as well as careless storage of fur production wastes and destroying them cause pollution problems, too. A more recent approach to water pollution control planning includes the use on non-aggregative methods. Here, different types of effects on the social and cultural environment, the physical environment and nature in the area are to be taken into consideration, not so that they are converted to money but in their respective dimensions. (EG)

15661 (NEI-DK–1910, pp. 122-134) **Changing from cleaning technology to cleaner technology.** Georg, S. (The Copenhagen School of Economics and Business Administration, Inst. of Transport, Tourism and Regional Economics (Denmark)). Copenhagen Univ. (Denmark). Oekonomisk Inst. Mar 1994. (CONF-9011345–: Workshop on economics of the environment, Copenhagen (Denmark), 14-15 Nov 1990). In *Environmental economics and the Baltic region.* 170p. Order Number DE95766547. Source: OSTI; NTIS.

In a number of Western European countries more and more attention is being given to the development and diffusion of cleaner technologies, because attempts to treat and dilute our way out of many pollution problems have not proven to be satisfactory solutions. Compared to the situation in the Baltic and other Eastern European countries, where industry does little, if anything at all to reduce pollution, the environmental problems facing Denmark may seem minuscule, and the concept of cleaner technology somewhat farfetched. However, in light of the growing concern for the environment and the budding attempts to protect the environment in Eastern Europe, there is no reason why these countries should make the same 'mistakes' as the Western European countries by choosing to treat rather than prevent the environmental problems. The concept of cleaner technology is presented in more detail. The endeavours of the Danish government to promote cleaner technology are presented and discussed in the following section, with special attention being given to the results of 'The Cleaner Technology programme' (1986-89). (EG)

15662 (NEI-DK–1910, pp. 151-170) **Pollution taxes and international competitiveness.** Birch Soerensen, P. (Copenhagen Business School, Institute of Economics, Copenhagen (Denmark)). Copenhagen Univ. (Denmark). Oekonomisk Inst. Mar 1994. (CONF-9011345–: Workshop on economics of the environment, Copenhagen (Denmark), 14-15 Nov 1990). In *Environmental economics and the Baltic region.* 170p. Order Number DE95766547. Source: OSTI; NTIS.

Throughout the industrialized world policy makers are becoming increasingly aware of the potential gains in economic efficiency and environmental quality to be reaped in certain areas of pollution control by switching from direct regulation to market-oriented policy instruments such as pollution taxes. However, concern about the impact on the international competitiveness of domestic producers seems to make governments in many countries hesitant to introduce pollution taxes. As a result, several observers have called for international agreements on harmonized pollution taxes among larger groups of countries such as the member states of the European Community. This paper argues that policy makers should be less concerned about the effects of pollution taxes on international competitiveness and more conscious about their effects on economic efficiency and equity. If pollution taxes improve the allocation of resources, it would be possible to compensate those citizens who might lose from their introduction and still leave the rest of society better off. The openness of the economy only means that a given improvement of environmental quality can be achieved through a lower level of pollution tax rates than would be necessary in a closed economy, because a given pollution tax rate will cause a greater contraction of output in polluting industries, the more these industries are exposed to foreign competition. (EG)

15663 (NEI-NO–494) **Energy strategies for the world. A case for international cooperation.** Brundtland, G.H. Norsk Petroleumsforening, Oslo (Norway). 1994. 5p. (CONF-9408229–1: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766570. Source: OSTI; NTIS; INIS.

The conference paper deals with policy aspects on environmental protection. The conclusion of the paper goes on the cooperation between the Government and industry to lay the foundation for a common, cooperative energy future. To achieve security of energy supplies and environmental protection, there is a need of developing stable market and framework conditions. According to the author, a good example is development of gas where long term commercial relations are needed to develop production and markets. This should also be acknowledged by governments in their policy making.

15664 (NEI-NO–495) **Trends and changes in the European energy situation.** Adam, G. Norsk Petroleumsforening, Oslo (Norway). 1994. 7p. (CONF-9408229–2: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766571. Source: OSTI; NTIS; INIS.

The conference paper gives a summary of the energy policy in Europe with the focus on trends and changes in the energy situation. Aspects discussed in this paper are energy and society, energy demand, policy issues, the European response, and the European Energy Charter.

15665 (NRRI–92-17) **Regulatory policy issues and the Clean Air Act: An interim report on the state implementation workshops.** Rose, K.; Burns, R.E. National Regulatory Research Inst., Columbus, OH (United States). Aug 1992. 81p. Sponsored by

USDOE, Washington, DC (United States);National Regulatory Research Inst., Columbus, OH (United States);Environmental Protection Agency, Washington, DC (United States). DOE Contract AI01-92PE10021. (CONF-9303334–Summ.: Regulatory policy issues and the clean air act workshop; Regulatory policy issues and the clean air act workshop; Regulatory policy issues and the clean air act workshop; Regulatory policy issues and the clean air act workshop, Albuquerq Order Number DE95008740. Source: OSTI; NTIS; GPO Dep.

The National Regulatory Research Institute (NRRI), with funding from the U.S. Environmental Protection Agency (EPA) and U.S. Department of Energy (DOE), conducted two workshops on state public utility commission implementation of the Clean Air Act Amendments of 1990 (CAAA). The first workshop was held in Charlotte, North Carolina for southern and eastern states in April 1992 and the second was held in St. Louis, Missouri for Midwestern states in May. The workshops had four objectives: (1) discuss key issues and concerns on CAAA implementation, (2) encourage a discussion among states on issues of common interest, (3) attempt to reach consensus, where possible, on some key issues, and (4) provide the workshop participants with information and materials to assist in developing rules, orders, and procedures in their state. Of primary interest from the federal perspective was for workshop participants to return to their states with additional background and understanding of how state commission actions may affect implementation of the CAAA and enable them to provide guidance to their jurisdictional utilities. It was hoped this would reduce some of the uncertainty utilities face and assist in the development of an efficient allowance market. The basic format of the workshops was that invited speakers made presentations on specific issues. "Primary participants" from each state and other workshop attendees then discussed the issues raised by the speakers and other related concerns. The primary participants were state commissioners, commission staff, representatives from state consumer advocate organizations, EPA, DOE, and the Federal Energy Regulatory Commission (FERC). Other attendees were utility representatives, consultants, and other interested parties. All participants were given a workbook with excerpts from an NRRI report on CAAA implementation and papers or outlines from speakers.

15666 (SAND–95-0563C) **Summary of the energy efficient, waste-reducing technology assessment conducted for DOE and EPAct 2108.** Weinbrecht, E. (Sandia National Labs., Albuquerque, NM (United States)); Zachritz, W. Sandia National Labs., Albuquerque, NM (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503119–3: ECM '95 conference, Las Cruces, NM (United States), 12-15 Mar 1995). Order Number DE95009561. Source: OSTI; NTIS; GPO Dep.

The industrial sector is the most complex and diverse segment of the US economy. There are more than 360,000 industrial facilities in the US, using tens of thousands of processes with millions of different pieces of equipment and employing nearly 30 million people to make hundreds of thousands of products. These facilities consume large quantities of raw materials and energy resources every year. Their waste streams, as well as the technology options for preventing them, are very specific not only to individual industries, but even to plants within the same industry that produce similar products. On October 24, 1992, President Bush signed the Energy Policy Act of 1992 (EPAct) into law as Public Law 102-486. Section 2108 of the Act requires the DOE to identify opportunities to demonstrate energy efficient pollution prevention technologies and processes. As a first step in DOE's response to congress, Sandia National Laboratories lead a fast tracked project to compile information from the open literature, and pilot a process for identifying and prioritizing opportunity areas from industrial and federal experts. Approximately 300 documents were collected and reviewed, and knowledgeable individuals in government, universities, and trade associations were interviewed. A panel of experts from petroleum industry was assembled for the future opportunity assessments pilot These activities were conducted between May and August, 1993. Project background and results are summarized.

15667 (SAND–95-0570C) **Benefits of improved environmental cooperation on a joint DoD/DOE facility.** Pratt, G.K. (Tetra Tech, Inc., Albuquerque, NM (United States)); Gibson, J.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950451–1: 21. national environmental symposium and exhibition, San Diego, CA (United States), 17-21 Apr 1995). Order Number DE95009584. Source: OSTI; NTIS; INIS; GPO Dep.

Numerous Federal facilities within the US involve multiple government agencies that face overlapping environmental concerns. This paper highlights the benefits of looking beyond the strict letter of environmental regulations that might affect a single tenant or environmental site to cooperative environmental efforts that focus on the entire facility, consistent with the missions of participating agencies. Using Kirtland Air Force Base (AFB) as a model, seven areas of Department of Defense (DoD) and Department of Energy (DOE) environmental cooperation are discussed that span technical, regulatory compliance, and administrative issues.

15668 (UCRL-JC–118798) **Bite the apple, get driven out of the garden: A risky story telling at the ASME town meeting.** Majumdar, K.C. Lawrence Livermore National Lab., CA (United States). Nov 1994. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950740–12: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95008074. Source: OSTI; NTIS; INIS; GPO Dep.

Risk, the all-encompassing four-letter word became a widely used household cliche and an institutional mantra in the nineties. Risk analysis models from the Garden of Eden to the Capitol Hill lawn have made a number of sharp paradigm shifts to evolve itself as a decision-making tool from individual risk perception to societal risk-based regulatory media. Risk always coexists with benefit and is arbitrated by costs. Risk-benefit analysis has been in use in business and industry in economic ventures for a long time. Only recently risk management in its current state of development, evolved as a regulatory tool for controlling large technological systems that have potential impacts on the health and safety of the public and on the sustainability of the ecology and the environment. This paper summarizes the evolution of the risk management concepts and models in industry and the regulatory agencies in the US over the last three decades. It also discusses the benefits and limitations of this evolving discipline as it is applied to high-risk technologies from the nuclear power plant and petrochemical industry, etc. to nuclear weapons technology.

15669 (WHC-SD-GN-PMP–20004) **QUEST2: Release 1: Project plan deliverable set.** Braaten, F.D. Westinghouse Hanford Co., Richland, WA (United States). 10 Feb 1995. 122p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95008803. Source: OSTI; NTIS; INIS; GPO Dep.

This Project Management Plan combines the project management deliverables from the P+ methodology which are applicable to Release 1 of the QUEST2 work. This consolidation reflects discussions with WHC QA regarding an appropriate method for ensuring that P+ deliverables fulfill the intent of WHC-CM-3-10 and QR-19.

The latest information investigations and discussions were given on worldwide endowments, supply/demand, and prices of different energy resources. The energy resources as the objects of the

discussions included petroleum, coal, natural gas, nuclear fuel, biomass, hydropower, underground heat, wind power, and solar energy. Information and data on their mass, prices, and related technologies were put into systematic orders. The confirmed reserves of fossil fuel and nuclear fuel resources can take care of the current production for more than 40 years, and no shortage in the near future was forecast. With respect to evaluating the external economic cost for the use of energy resources, main discussion points on the externality were put into order and considered. An example of the evaluation performed in England was introduced. However, it was indicated that the evaluation result accompanied high uncertainty. In a long-term world energy demand prospect, demands from 18 to 41 billion tons are estimated in the year 2100 as converted into petroleum. Necessity for the principal energy that can substitute for petroleum was described. 89 refs., 18 figs., 47 tabs.

15671 (DOE/GO–10095-019) **Program Plan for Renewable Energy generation of electricity. Response to Section 2111 of the Energy Policy Act of 1992.** USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). Dec 1994. 24p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94011856. Source: OSTI; NTIS; GPO Dep.

A 5-Year Program Plan for providing cost-effective options for generating electricity from renewable energy sources is presented by the US Department of Energy Office of Energy Efficiency and Renewable Energy. The document covers the Utility-Sector situation, scope of the program, specific generating technologies, and implementation of the program plan.

2905 Research, Development, Demonstration, and Commercialization

15672 (DOE/ER/75633–T3) **Technology Transfer Demonstration Project. Final report, September 1991–June 1994.** Rural Enterprises, Inc., Durant, OK (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-91ER75633. Order Number DE95010180. Source: OSTI; NTIS; GPO Dep.

Rural Enterprises, Inc. (REI) and the Rural Technology Applications Team (RTAT) submit this final report in support of the scopes of work for the Department of Energy. It covers significant activities occurring during September 1991 to June 1994. Through RTAT, Rural Enterprises, Inc. acts as a technology transfer agent between individuals, businesses and local governments with technical problems, and the sources of technology available to solve these problems. REI's professional technology transfer team regularly evaluates developments intechnological innovations and data from many sources, seeking to match them with prospective users of that technology. The DOE's assistance is crucial in the creation of new and long-term private sector jobs in an area of economic depression and underemployment.

15673 (LA-UR–95-1104) **Forging strategic partnerships with industry: The Industrial Fellows Program.** Adams, K.; Castain, R.; Hynes, M.V.; Sanders, V.; Siemon, R.; Tellier, A.; Tiedman, A.; Umbarger, J.; Wilson, M. Los Alamos National Lab., NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9507101–1: Technology Transfer Society annual conference, Washington, DC (United States), Jul 1995). Order Number DE95009490. Source: OSTI; NTIS; GPO Dep.

Science, technology, and industrial policy are at an important nexus due to long developing trends in the national and international economy and recent events in national security affairs. The research and development assets built by the American taxpayer in response to the Cold War face a quest for relevance in the new era. National competitiveness in international markets has emerged as an important new priority. To better understand the perspective of US industry the management of the Los Alamos National Laboratory has initiated an Industrial Fellows Program which has placed six individuals at US corporations. Their goal is to create strategic partnerships through increased understanding of technical needs of industry and the technical capabilities of the Laboratory.

15674 (NEDO-GET–9310-3) **Project of promoting developments of innovative technology for the earth. International research exchange project.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 288p. (In Japanese). Order Number DE95769802. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

This paper describes research and development activities on solving global environmental problems, directed to creating new research regions and structuring technological systems, being performed by the Research Institute of Innovative Technology for the Earth (RITE) during fiscal 1993. In the invitational projects for overseas researchers, with an intention of executing research exchanges in wide areas between overseas researchers and Japanese researchers who are carrying out advanced researches on global environment related technologies, seven researchers were invited from different countries to implement joint researches. At the same time, twelve researchers in European countries and the U.S.A. were invited to the international vegetation science conference, the global environmental problem seminar, and the plant molecular physiology lecture meeting. With an objective of effectively promoting the researches done by Japanese researchers and identifying the trends in overseas research and development activities, six researchers were sent to universities and research institutes in Europe and America. Seven researchers were also sent to international conferences and symposiums on global environment related technologies. The major themes included carbonate fixation by plants through their photosynthesis, CO2 chemistry, and hydrogen energy development at IEA. 58 refs., 77 figs., 12 tabs.

15675 (NEDO-P–93-57) **Feasibility survey on international cooperation for high efficiency energy conversion technology in fiscal 1993.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 149p. (In Japanese). Order Number DE95769804. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

Following cooperative researches on fuel cell jointly conducted by NEDO and EGAT (Electricity Generating Authority of Thailand), the survey on international cooperation relating to high efficiency energy conversion technology was carried out for the ASEAN countries. The paper summed up the results of the survey. The study of the international cooperation is made for the following three items: a program for periodical exchange of information with EGAT, a project for cooperative research on phosphoric acid fuel cell in Indonesia, and a project for cooperative research with EGAT on electric power storage by advanced battery. In Malaysia, which is small in scale of state, part of the Ministry of Energy, Telecommunication and Posts is only in charge of the energy issue. Therefore, the situation is that they cannot answer well to many items of research/development cooperation brought in from Japan. The item of medium- and long-term developmental research in the Philippines is about the problems which are seen subsequently in the Manila metropolitan area where the problem of outage is being settled. Accordingly, it is essential to promote the cooperative research, well confirming policies and systems of the Ministry of Energy and the national electricity corporation. 12 figs., 17 tabs.

15676 (NEI-DK–1899) **Financial assistance to environmentally protective activities in Eastern and Central Europe. Annual report for 1993.** Miljoestyrelsen, Copenhagen (Denmark). 1994. 65p. (In Danish). Order Number DE95766489. Source: OSTI; NTIS.

Details are given on the scope and character of Danish financial assistance given to projects aimed at improving the condition of the environment within Eastern and Central Europe during 1993 and comments are given on political aspects by the Chairman of the Advisory Committee for the environment-support setup (which

ranges under the Danish government) who is a well-known Danish journalist specializing in these regions. Information on legal aspects are included and also on various related conferences that have taken place during this period. The Danish Ministry of the Environment received 172 applications from Danish organizations wishing to carry out environmentally improving projects, and 69 of these were answered positively so that the total amount of financial assistance amounted to 189.0 million Danish kroner. The projects which were successful in receiving subsidies are described in detail, and those responsible for them are named in each case. The projects concern technology transfer and also such subjects as the preservation of the marshes in Estonia, the establishment of a society for the protection of birds and the improvement of hospital waste management in Poland. (AB)

15677 (ORNL–6842) **Physics Division progress report for period ending September 30, 1994.** Ball, S.J. (ed.). Oak Ridge National Lab., TN (United States). Apr 1995. 375p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95010498. Source: OSTI; NTIS; INIS; GPO Dep.

This report covers the research and development activities of the Physics Division for the 1993 and 1994 fiscal years, beginning October 1, 1992, and ending September 30, 1994. The activities of this Division continue to be concentrated in the areas of experimental nuclear physics, experimental atomic physics, and theoretical nuclear and atomic physics. In addition, there are smaller programs in particle physics, plasma diagnostics, and data compilation and evaluation. A new program in nuclear astrophysics has been initiated to take advantage of the forthcoming radioactive ion beams from the reconfigured Holifield Facility. During this two-year reporting period, the Holifield Facility has been undergoing a rebirth as a radioactive ion beam facility. The facility is on budget and on schedule toward a first beam delivery date of August 31, 1995.

15678 (PNL–10519-1) **AMTEX first quarter FY95 report.** Pacific Northwest Lab., Richland, WA (United States). Dec 1994. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010547. Source: OSTI; NTIS; GPO Dep.

The AMTEX Partnership™ is a collaborative research and development program among the US Integrated Textile Industry, the Department of Energy (DOE), the national laboratories, other federal agencies and laboratories, and universities. The goal of AMTEX is to strengthen the competitiveness of this vital industry, thereby preserving and creating US jobs.

15679 (RISO-R–800(EN)) **Systems Analysis Department annual progress report 1994.** Larsen, H.; Petersen, K.E. (eds.). Risoe National Lab., Roskilde (Denmark). Systems Analysis. Mar 1995. 76p. Order Number DE95766440. Source: OSTI; NTIS; Also available from Risoe Library, P.O. Box 49, DK-4000 Roskilde, Denmark.

The report describes the work of the Systems Analysis Department at Risoe National Laboratory during 1994. The department is made up of the Cognitive Systems Group, the Risk Analysis Group, the Energy Systems Group, and the UNEP Collaborating Centre for Energy and Environment. The report includes lists of publications, lectures and staff members. (au)

15680 (UCRL–53868-94) **Engineering research, development and technology.** Lawrence Livermore National Lab., CA (United States). Feb 1995. 304p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010403. Source: OSTI; NTIS; GPO Dep.

The mission of the Engineering Research, Development, and Technology Program at Lawrence Livermore National Laboratory (LLNL) is to develop the technical staff, tools, and facilities needed to support current and future LLNL programs. Our efforts are guided by a dual-benefit research and development strategy that supports Department of Energy mission, such as national security through nuclear deterrence and economic competitiveness through partnerships with US industry.

15681 (UCRL-ID–119321) **National strategic challenges and the role of Lawrence Livermore National Laboratory.** Al-Ayat, R.A.; Chrzanowski, P.L.; Werne, R.W. Lawrence Livermore National Lab., CA (United States). Jan 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010208. Source: OSTI; NTIS; GPO Dep.

The end of the Cold War was a water-shed event in history–an event that calls for re-evaluation of the basic assumptions and priorities of US national security that have gone essentially unchallenged for nearly 50 years. Central to this re-evaluation are the changing needs for federal Science and Technology (S and T) investment to underpin national and economic security and the role of the Department of Energy (DOE) national laboratories in fulfilling those needs. The three nuclear weapons laboratories-Los Alamos National Laboratory (LANL), Lawrence Livermore National Laboratory (LLNL), and Sandia National Laboratory (SNL)-are major constituents of DOE's national laboratory system. They helped win the Cold War, and will undoubtedly continue to support US security S and T requirements. This paper discusses of the role these three laboratories, and LLNL in particular, can play in supporting the nation's S and T priorities. The paper also highlights some of the changes that are necessary for the laboratories to effectively support the national S and T and economic competitiveness agenda. These issues are important to DOE and laboratory managers responsible for the development of strategic direction and implementation plans.

15682 (GRS–111) **International Nuclear Event Scale for reportable events in nuclear installations. User manual.** Kotthoff, K. Gesellschaft fuer Anlagen- und Reaktorsicherheit (GRS) mbH, Koeln (Gemany). Jun 1994. 138p. (In German). Order Number DE95769210. Source: OSTI; NTIS (US Sales Only); INIS.

The INES classification scale permits guided classification of events in nuclear installations by means of the clearly defined, international standard scale. It covers classes 0 through 7. It has been established in order to allow exchange of authentic information and data on nuclear accidents on an international level within short time, 24 hours. It also serves as a basis for information to the general public as to safety relevance of events occurred. The INES scale is applicable to characterising notifyable events that have occurred in civil nuclear installations, or events occurring during the transport of radioactive material to and from these installations. The scale has been established as a joint publication by the IAEA and NEA, and is subject to the supervision by the IAEA in its practical implementation. (HP)

15683 (INIS-BR–3490) **Nucleoelectric energy dilemma in Brazil in the 1980's.** Darella, M.D.P. Santa Catarina Univ., Florianopolis, SC (Brazil). Programa de Mestrado em Sociologia Politica. Nov 1989. 192p. (In Portuguese). Order Number DE95627061. Source: OSTI; NTIS (US Sales Only); INIS.

Production of electrical energy by nuclear reactors is unnecessary in Brazil. This option, which was concrete by the beginning of the 1970's, had its origins in the industrialized countries of the northern hemisphere. It signified a political ideological decision of an authoritarian and strategic nature, and not a technical scientific or ethical one. It began with the purchase of Angra 1 and was intensified in 1975, with the signing of the Brazilian-German Nuclear Agreement, establishing a double dependency: that of the nuclear reactors and that of combustion. The federal government was interested in the transference and command of technology, the production of electrical energy being secondary. Even through it was used as a justification for the country, the offer of electrical energy was already greater than the demand. In 1979, the Parallel Nuclear Program entered the scene. It was not subject to international inspections and was under exclusive control of the Armed Forces and the National Commission of Nuclear Energy, whose growing strength during the entire decade of the 1980's is notorious. At the same time, the Brazilian Nuclear Program lost in the 1980's the vitality that could be observed for the previous decade. It incurred accentuated technical errors and presented an extremely serious situation principally with regards to the emergency

plan for the population of Angra dos Reis and neighboring cities and for the disposal of radioactive residues, which continue without a solution or definitive place. It is concluded that it is not possible to proceed with a energy policy that subsidizes electrical energy - the least expensive in the world - preponderantly to the industrial sector, for the private national and trans national initiative. In this situation there is no room for thermonuclear energy, onerous to the public coffers and dangerous to the population, to the natural environment and to the entire Planet. (author). 217 refs, 1 fig, 17 tabs.

15684 (STUK-YTO-TR–74) **Review of psychological consequences of nuclear accidents and empirical study on peoples reactions to radiation protection activities in an imagined situation.** Haukkala, A. (Helsinki Univ. (Finland). Dept. of Social Psychology); Eraenen, L. Finnish Centre for Radiation and Nuclear Safety (STUK), Helsinki (Finland). Oct 1994. 51p. (In Finnish). Order Number DE95627065. Source: OSTI; NTIS; INIS.

The report consist of two parts: a review of studies on psychological consequences of nuclear and radiation accidents in population and an empirical study of peoples reactions to protection actions in an event of hypothetical accident. Review is based on research results from two nuclear reactor accidents (Three Mile Island 1979, Chernobyl 1986) and a radiation accident in Goiania, Brazil 1987. (53 refs, 2 figs.,7 tabs.).

2907 Transport and Storage

15685 (NEI-NO–549) **Allocation metering of marginal fields. Requirements of Norwegian authorities.** Raustein, O. (Oljedirektoratet (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 6p. (CONF-9408229–56: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway). 23-26 Aug 1994). Order Number DE95766625. Source: OSTI; NTIS.

The conference paper deals with the requirements of Norwegian Authorities on multiphase flow technology. The paper discusses the existing regulations on multiphase flow metering by exemplifying the measuring techniques used on several offshore fields. The Authorities approach to measuring methods by new designed multiphase meters is included. 2 figs.

15686 (ETDE-DE–76) **Subsequent installation of cogeneration units in existing heating station in the new federal states.** Joksch, H.O.; Mahfoud, S.; Schoebel, G.; Vossik, A.; Hannig, J. EWU Engineering GmbH, Berlin (Germany); Bundesministerium fuer Forschung und Technologie, Bonn (Germany). 1992. 21p. (In German). Foerderkennzeichen BMFT 0329298A. Order Number DE95769270. Source: OSTI; NTIS (US Sales Only).

While in condensing power plants an efficiency of about 40% can be attained for power generation this can be increased to 85% with combined heat and power generation in cogeneration plants. The primary aim is to find suitable technological solutions for existing heating stations with 6.5 t/h, 10 t/h and 40 t/h steam generators (pressure 1.3 MPa, superheater outlet temperature 220 C) in order to realize primary energy savings, an additional effective possibility to generate electric energy as well as a reduction of environmental loads and finally a competitive plant by retrofitting the plant with cogeneration units (steam turbines, gas turbines, combustion engines). The study aims at comparing the additional expenses on the one hand and the improvements, particularly the reduction of energy consumption and environmental loads, on the other. In order to solve this task for a number of varied conditions (fuel, steam parameters, circuit parameters) the resulting total costs from construction and operation of the heat-generating plant were determined for one heat unit and compared to each other. Major stories in this issue are: Major energy companies' strategies shift from growth to consolidation; Report assesses the oil and gas resources of Fergana Basin, Former Soviet Union; Natural gas wellhead prices expected to remain low in first half 1995; Reliability and the changing electric power industry; EIA updates reference on US coal; Decommissioning of US uranium production facilities examined by EIA; and Improved technology leads to lower energy price projections. The remaining part of the bulletin lists recent publications, including machine readable files, and contacts for energy data information.

15688 (DOE/EIA–M068-B/1) **Model documentation: Electricity Market Module. Modifications to the electricity capacity planning submodule.** USDOE Energy Information Administration, Washington, DC (United States). Energy Supply and Conversion Div. Apr 1995. 25p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010355. Source: OSTI; NTIS; GPO Dep.

The Electricity Market Module (EMM) is the electricity supply component of the National Energy Modeling System (NEMS). The EMM represents the generation, transmission, and pricing of electricity. It consists of four main submodules: Electricity Capacity Planning (ECP), Electricity Fuel Dispatching (EFD), Electricity Finance and Pricing (EFP), and Load and Demand-Side Management (LDSM). The ECP evaluates changes in the mix of generating capacity that are necessary to meet future demands for electricity and comply with environmental regulations. The EFD represents operating decisions and determines how to allocate available capacity to meet the current demand for electricity. Using investment expenditures from the ECP and operating costs from the EFD, the EFP calculates the price of electricity, accounting for state-level regulations involving the allocation of costs. The LDSM translates annual demands for electricity into distributions that describe hourly, seasonal, and time-of-day variations. These distributions are used by the EFD and the ECP to determine the quantity and types of generating capacity that are required to ensure reliable and economical supplies of electricity. The EMM also represents non-utility suppliers and interregional and international transmission and trade. The ECP uses a linear programming (LP) model to consider planning decisions involving changes in capital stock that occur over several years and require a substantial capital investment. It projects how the electric power industry will change its generating capability in response to changes in environmental regulations and increases in demand. The ECP has been modified for the Annual Energy Outlook 1995. Enhancements to the ECP include an endogenous representation of maintenance scheduling, the incorporation of technological optimism and learning factors, and a market-sharing algorithm.

15689 (IEE-SR–253) **Fiscal 1993 actual energy supply/demand and short-term prospect. Report of the energy supply/demand trend survey committee.** Institute of Energy Economics, Tokyo (Japan). Jun 1994. 120p. (In Japanese). Order Number DE95764070. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

The paper reports fiscal 1993 energy supply/demand trends in Japan. The domestic supply of the primary energy was 485,647 x 10^{10} kcal, 1.0% over 1992 indicating the same growth as in the previous year. By energy source, hydroelectric power showed a marked increase of 17.0% over last year. Nuclear power indicated a 14.0% growth over 1992, including four new power plants which started operation. As a result, all the primary power made a substantial rise of 14.9% over the preceding year. Coal increased 1.6%, helped by an increase in consumption of steam coal in power generation, with the starting operation of the new coal thermal power generation. Imports of petroleum products markedly

declined by 18.4% because of the continued shifting to domestic products. Natural gas showed almost the same level as in the previous year, a 0.6% increase, because of slow growth in power demand. The ultimate energy consumption was 336,120 x 10^{10} kcal, indicating a 1.0% increase. Energy consumption in the industrial sector was a 1.1% rise, despite of the business stagnation, and that in the residential sector a 3.3% rise. 35 figs., 73 tabs.

15690 (NEDO-NP–9321) **Survey for improving the supply and demand structure in private-sector energy use.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 289p. (In Japanese). Order Number DE95769800. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

For the purpose of rationalizing and energy-conserving use of private-sector energy utilized in buildings for residential houses and business, an investigational study is made for areas where the district air conditioning is introduced. As of the end of 1993, there are 112 business areas, 60% of which are especially in the Kanto area. As for business patterns of heat suppliers, the method of direct management by energy company covers half of all management types in the existing urban area rearrangement type. The method of private management dominates the industrial site utilization development type, and the third sector method is much adopted to the new town type. As energy source, the rate of conversion from petroleum to electricity is making an annual increase, and utilization of unused energy such as exhaust heat from refuse incineration and of exhaust heat from cogeneration is expedited. Energy efficiency which is a ratio of the fuel consumption amount (input) to the heat selling amount (output) is 1.05, 1.56 and 1.38 in medium-scale suburb-type redevelopment, large-scale resort development and small-scale urban-type redevelopment samples, respectively. The reason why the medium-scale suburb-type redevelopment is excellent in energy efficiency as 1.05 is well balance of heat demand and large effects of heat storage tanks and heat recovery turbo refrigerators.

15691 (NEDO-P–9334) **Investigations on the energy and infrastructural situations in China.** New Energy and Industrial Technology Development Organization, Tokyo (Japan). Mar 1994. 36p. (In Japanese). Order Number DE95769805. Source: OSTI; NTIS; Available from New Energy and Industrial Technology Development Organization, Sunshine 60, 30F 1-1, 3-chome, Higashi-Ikebukuro, Toshima-ku, Tokyo, Japan.

While analyzing the current status and estimating the future development of the Chinese economy, this paper analyzes emphatically the nation's energy and infrastructure situations, and proposes the ways the Japan's economic cooperation to China should be. Amid the worldwide recession, the Chinese economy alone is enjoying the economic boom and making the foreign capital inflow a record high. However, China holds behind these optimistic scenes a large number of structural or short to medium and long term problems including inflation, commodity price hike, unemployment, shortage in infrastructures, and tightening energy supply. The nation is facing not an easy way in its future. In the transportation sector, the country has decisive shortage in facilities to handle the demands that will grow with the economic development. The energy problem is represented by limited supply capacity such as oil production hitting the ceiling, as well as that in coal production as a primary problem. The low energy efficiency is another example. Electric power shortage is also serious. Japan is required to cooperate with China also in the personnel training, and medical and cultural areas in addition to giving assistance to eliminate bottlenecks in the Chinese economy. It is also necessary to advocate symbolic cooperative projects by which the peoples of China will be endowed with benefits. 2 figs., 15 refs.

15692 (NEI-NO–496) **World economic development. The consequences for the energy sector.** Matsui, Ken-ichi (Energy Data and Modelling Center. Inst. of Energy Economics, Tokyo (Japan)). Norsk Petroleumsforening, Oslo (Norway). 1994. 9p. (CONF-9408229–3: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766572. Source: OSTI; NTIS.

The conference paper discusses the economic development and the growing energy demand worldwide. The attention is laid on the development in Asian countries and China in particular. According to the author, the influencing factors are the population growth, economic growth accompanied by the growing trade, rapid industrialization oriented for heavy and chemical products, rapid motorization, and the shift from non-commercial to commercial energy in the residential sector in Asian countries. 3 refs.

15693 (NEI-NO–497) **Norway as a reliable supplier of clean energy to Europe.** Stoltenberg, J. Norsk Petroleumsforening, Oslo (Norway). 1994. 6p. (CONF-9408229–4: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766573. Source: OSTI; NTIS.

The conference paper describes some of the Norwegian challenges regarding the supply of oil, gas, and electricity. The author points out some of the developments in the European Union (EU). These developments are of great importance due to their influence on the value of energy resources and the ability of energy supply. Topics are: Electricity - stronger links to Europe; developments and challenges in the petroleum sector covering future challenges and fiscal framework and taxes; EU energy policies; gas - clean energy to EU.

15694 (NEI-NO–498) **The changing role of CIS states in the energy market.** Vowinckel, G. (European Bank for Reconstruction and Development, London (United Kingdom)). Norsk Petroleumsforening, Oslo (Norway). 1994. 16p. (CONF-9408229–5: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766574. Source: OSTI; NTIS.

The conference paper deals with the role of the European Bank for Reconstruction and Development (EBRD) on the stimulation of economic growth and public infrastructure projects in Central and Eastern Europe and in the former Soviet Union (CIS). The very specific task is to assist the transition process in these countries. An important mandate is to help their move towards economic reforms with the oil and gas industry as an essential part of it. Topics are: The oil and gas sector in the former CIS; oil and gas projects; project financing; investment climate; other investments; gas production and supply; Gazprom; transportation.

15695 (ORNL/CON–405) **Utility DSM Programs from 1989 through 1998: Continuation or cross roads?.** Hadley, S.; Hirst, E. Oak Ridge National Lab., TN (United States). Feb 1995. 47p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009064. Source: OSTI; NTIS; GPO Dep.

Over the past five years, the Energy Information Administration (EIA) has been collecting data annually from U.S. electric utilities on their demand-side management (DSM) programs, both current and projected. The latest data cover activities for 1993 and projections for 1994 and 1998. In 1993, 991 utilities operated DSM programs. That year, they spent $2.8 billion, a 13% increase over 1992 expenditures. These and earlier DSM programs saved 44,000 GWh of energy and reduced potential peak demand by 40,000 MW, 30% and 22% increases over the 1992 values, respectively. While some people predict the demise of electric-utility DSM programs, the data do not paint so bleak a picture. In most parts of the country, DSM programs grew in 1993 and utilities (as of Spring 1994) projected continued growth through 1998. Expenditures grew from 1.3% of revenues in 1992 to 1.5% in 1993, and are expected to grow 2.5% per year faster than inflation, which is equivalent to revenue growth. Thus, DSM spending is expected to stay constant at 1.5% of revenues through 1998. Because of the cumulative effect of DSM programs, energy savings are expected to grow from 1.2% of sales in 1992 to 1.6% in 1993 and 3.0% in 1998. Potential-peak reductions are expected to increase from 5.9% of peak demand in 1992 to 6.8% in 1993 and 8.9% in 1998. However, the growth in spending is not as rapid as the 8% annual real growth projected a year earlier. Actual expenditures in 1993 were 6.5% lower than projected early that year. Energy savings, on the other hand, were the same as projected earlier. Potential peak reductions were actually 9% higher than previously projected.

15696 (PNL-SA–25138) **Energy security in the post-Cold War era: Identifying future courses for crises.** Freund, M.T.; Wise, J.A.; Ulibarri, C.A.; Shaw, B.R.; Seely, H.E.; Roop, J.M. Pacific Northwest Lab., Richland, WA (United States). Nov 1994. 62p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-9411212–1: Energy and national security in the 21st century conference, Washington, DC (United States), 10 Nov 1994). Order Number DE95007817. Source: OSTI; NTIS; GPO Dep.

This paper addresses US energy security in the post-Cold War era for a conference on energy security jointly sponsored by the Department of Energy and the National Defense University. It examines the evolving nature of energy security based on analysis of past crisis-inducing events and-discusses potentially important geopolitical, environmental, regulatory, and economic developments during the next twenty-five years. The paper steps beyond the traditional economic focus of energy security issues to examine the interplay between fundamental economic and technical drivers on the one hand, and political, environmental, and perceptual phenomena, on the other hand, that can combine to create crises where none were expected. The paper expands on the premise that the recent demise of the Soviet Union and other changing world conditions have created a new set of energy dynamics, and that it is imperative that the United States revise its energy security perspective accordingly. It proceeds by reviewing key factors that comprise the concepts of "energy security" and "energy crisis" and how they may fit into the new world energy security equation. The study also presents a series of crisis scenarios that could develop during the next twenty-five years, paying particular attention to mechanisms and linked crisis causes and responses. It concludes with a discussion of factors that may serve to warn analysts and decision makers of impending future crises conditions. The crisis scenarios contained in this report should be viewed only as a representative sample of the types of situations that could occur. They serve to illustrate the variety of factors that can coalesce to produce a "crisis."

15697 (BNL–61556) **US Least Cost Energy Strategy: Review and update.** Morris, S.C. Brookhaven National Lab., Upton, NY (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-76CH00016. (CONF-9409326–1: International Energy Agency Energy Technology systems analysis program workshop, Banff (Canada), 2-9 Sep 1994). Order Number DE95009547. Source: OSTI; NTIS; GPO Dep.

The Energy Policy Act of 1992 requires the US Department of Energy (DOE) to develop a Least Cost Energy Strategy to be updated on a regular basis. Social and environmental costs are to be considered in addition to direct energy costs. Partly because the emphasis was on a least-cost strategy, DOE selected MARKAL as the model to be used in the analysis. Brookhaven National Laboratory is assisting DOE in the following areas: data development, training, confidence building and illumination of model behavior, calibration, scenario development, model runs, interpretation of results, and documentation. The work began with an emphasis on MARKAL, but during the summer of 1994 a shift was made to MARKAL-MACRO.

15698 (DOE/BP–2186) **BPA statutes.** USDOE Bonneville Power Administration, Portland, OR (United States). Jan 1995. 120p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009165. Source: OSTI; NTIS; GPO Dep.

This publication includes the Bonneville Power Administration's (BPA) authorities. It combines the two previous booklets of BPA authorities' and adds: sections of certain Appropriation Acts affecting BPA; a list of all other Appropriation Acts affecting BPA; a list of the acts authorizing Federal hydroelectric dams in the Columbia River Basin; portions of the Energy Policy Act of 1992 that specifically apply to BPA; portions of the Federal Power Act to provide context for the Energy Policy Act. The laws are in their United States Code format, rather than in the Public Law format as passed. Thus, the citation for Bonneville Project Act section 2(f) is shown as 16 USC §832a(f). Most people are familiar with the Public Law citations, so they have been retained and appear in italics at the end of each paragraph. In addition, later amendments to earlier laws are reflected in the United States Code language. For example, the Preference Act's definition of "Pacific Northwest" (16 USC §837(b)) reflects the Northwest Power Act's amendment of that term. The laws are presented in the numerical order they appear in the United States Code, rather than in the order in which they became law. Therefore, the Energy Policy Act of 1992 is presented first. This booklet is not, nor is it intended to be, an official reporter. All citations should be made to the United States Code or some other officially recognized reporter.

15699 (INIS-mf–14501) **Energy policy in Bulgaria.** Shervashidze, N. Komitet po Energetika, Sofia (Bulgaria). 1994. 12p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95627066. Source: OSTI; NTIS (US Sales Only); INIS.

The energy policy of Bulgaria is based on a long-term strategy consistent with the natural resources of the country, expected macro-economical development, geopolitical situation and regional cooperation with neighboring countries. A special priority is energy saving. A comparative evaluation shows that the energy production is at a considerably higher technical and economical level than its utilization by the users. Energy intensity is 3-5 times higher than the average European level. The main future directions in energy policy are: 1) Assuring a base for energy independence through coal supply. A maximal development of profitable openpit mining and restriction of underground mining is foreseen. 2) Gasification as a direction with wide energetic, ecological and social implications. Usage of natural gas in household and energy sectors will give a positive restructuring effect on the energy balance, will increase the energy efficiency as an alternative and competition of the thermal district heating. 3) Realistic and constructive approach to atomic energy (giving now 75% of the primary energy resources) as a strong contribution to energy balance. 4) Rehabilitation and modernization of fossil-fuel power plants which will increase their usability by 10%. 5) Further development of hydro energy along with complex utilization of water and solution of the regional social problems. 6) Solving of technical and financial problems of district heating. One common concern for all energy branches is the pricing mechanism which should not only assure a payback, but possible investments in new objects as well. 3 figs.

15700 (NEI-SE–198) **Proceedings of the African conference on policy options and responses to climate change.** Silveira, S. (ed.). Stockholm Environment Inst. (Sweden). 1995. 79p. (CONF-941266–: African conference on policy options and responses to climate change, Nairobi (Kenya), 5-8 Dec 1994). Order Number DE95766696. Source: OSTI; NTIS.

The African Conference on Policy Options and Responses to Climatic Change in Nairobi, 5-8 December 1994 was an important event in the preparations for the Conference of the Parties (CoP) to the Climate Convention in March-April 1995. It was attended by 120 delegates and researchers from all over Africa representing governments and NGOs, as well as international organisations. The conference discussions resulted in this document containing recommen- dations for African governments that will participate in the CoP to the Climate Convention. Despite the success of the Conference in terms of providing a forum for discussions of African interests in relation to the Climate Convention, it is obvious that there is still work to be done in order to guarantee the full participation of African countries in inter- national environmental fora. As agreed at the Conference, full participation means that African countries take an active role in defining negotiation agendas, research priorities and international policies. There is no doubt that African countries are interested in such an active role in the context of the Climate Convention. The participation in the Conference did indicate the level of this interest quite well. Africa is aware of her dependence on climate conditions to guarantee the livelihood of the majority of her population. The security of Africa's people depends on climate conditions. This is indeed a sufficiently strong reason for the full engagement of African countries in further elaboration and implementation of the Climate Convention.

15701 (ORNL/M–3754) **Environmental Guidance Program reference book: Toxic substances control act. Revision 7.** Oak Ridge National Lab., TN (United States). 1 Dec 1994. 187p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008105. Source: OSTI; NTIS; GPO Dep.

This Reference Book contains a current copy of the Toxic Substances Control Act and those regulations that implement the statute and appear to be most relevant to DOE activities. The document is provided to DOE staff for informational purposes only and should not be interpreted as legal guidance. Questions concerning this Reference Book may be directed to Mark Petts, EH-231 (202/586-2609).

15702 (SAND–94-0854) **Outlook for renewable energy technologies: Assessment of international programs and policies.** Branstetter, L.J.; Vidal, R.C.; Bruch, V.L.; Zurn, R. Sandia National Labs., Albuquerque, NM (United States). Feb 1995. 112p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95009084. Source: OSTI; NTIS; GPO Dep.

The report presents an evaluation of worldwide research efforts in three specific renewable energy technologies, with a view towards future United States (US) energy security, environmental factors, and industrial competitiveness. The overall energy technology priorities of foreign governments and industry leaders, as well as the motivating factors for these priorities, are identified and evaluated from both technological and policy perspectives. The specific technologies of interest are wind, solar thermal, and solar photovoltaics (PV). These program areas, as well as the overall energy policies of Denmark, France, Germany, Italy, the United Kingdom (UK), Japan, Russia, and the European Community as a whole are described. The present and likely future picture for worldwide technological leadership in these technologies-is portrayed. The report is meant to help in forecasting challenges to US preeminence in the various technology areas, particularly over the next ten years, and to help guide US policy-makers as they try to identify specific actions which would help to retain and/or expand the US leadership position.

15703 (SVF–532) **Compilation of EU-demands for combustion plants.** Hjalmarsson, A.K. (AaF-Energikonsult Stockholm AB, (Sweden)). Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Feb 1995 40p. (In Swedish). Order Number DE95766640. Source: OSTI; NTIS.

Directives are most commonly used to regulate environmental issues. The directives are usually set as minimum rules, meaning that the national laws cannot be weaker than the EU directive. Individual countries may have stricter laws, if they don't affect the free trade. There are directives limiting emissions into the atmosphere from large (> 50 MWt) combustion plants covering emissions of sulphur, nitrogen oxides and dust. For existing plants there are ceilings and reduction targets set individually on national basis. For new units emission limits are set for plants. The emission limits in Sweden set by laws and guidelines are stricter than the EU directives. New directives for large combustion plants should according to the plans be ready by the 1st of July 1995 - there is, however, not even a proposal yet. Emissions into the atmosphere from municipal waste incineration plants are covered in two directives, one for existing and one for new plants. There are also one proposal for more strict limits on emissions into the atmosphere and introduction of limits in emissions to water and solid residues. The proposal is stricter than the regulations in Sweden on several issues. There are directives covering other areas also affecting combustion plants to some extent, such as directives on solid residues. Work is in progress with varying results on proposals for directives on for example: - limitations of the sulphur content in heavy fuel oil, - application for a permit including environmental impact assessment, - taxes on CO_2 emissions. The directives for large combustion plants and for new and existing municipal waste incineration plants have been implemented in the Swedish regulations. 3 figs, 15 tabs

15704 (DOE/EE–0331) **Federal investment in fossil energy technology.** USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). Mar 1995. 102p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95010406. Source: OSTI; NTIS; GPO Dep.

On February 21, 1995, during a Congressional hearing on the FY 1996 budget request for the Department of Energy's Office of Fossil Energy, Congressman David Skaggs of the House Appropriations Committee Subcommittee on the Interior and Related Agencies, requested that Assistant Secretary Patricia Godley submit statements from private companies and others on the value of Federal investments in coal, oil and natural gas technology programs. Specifically, Rep. Skaggs asked for public testimony from private industry and others that would cite examples of technology that has been "brought to market viability or near viability that simply would not have happened if left to private investment decisions alone." The Department responded with the views of more than 280 industry officials, university professors, and State officials. Most of the responses cited specific technologies or advances that would not have been done, or done as quickly, without Federal investment. Others cited the educational opportunities created as part of Department of Energy-sponsored fossil energy university research. Still others cited improvements in the public knowledge base that have benefitted the private sector.

15705 (DOE/MC/28138–95/C0454) **Development of a Gas Systems Analysis Model (GSAM).** Becker, A.B.; Pepper, W.J. ICF Resources, Inc., Fairfax, VA (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-92MC28138. (CONF-950494–3: Natural gas research, development and demonstration contractors review meeting, Baton Rouge, LA (United States), 4-6 Apr 1995). Order Number DE95011041. Source: OSTI; NTIS; INIS; GPO Dep.

Objective of developing this model (GSAM) is to create a comprehensive, nonproprietary, PC-based model of domestic gas industry activity. The system can assess impacts of various changes in the natural gas system in North America; individual and collective impacts due to changes in technology and economic conditions are explicitly modeled in GSAM. Major gas resources are all modeled, including conventional, tight, Devonian Shale, coalbed methane, and low-quality gas sources. The modeling system assesses all key components of the gas industry, including available resources, exploration, drilling, completion, production, and processing practices. Distribution, storage, and utilization of natural gas in a dynamic market-gased analytical structure is assessed. GSAM is designed to provide METC managers with a tool to project impacts of future research, development, and demonstration benefits.

15706 (NEI-NO–502) **The next generation of projects on the Norwegian continental shelf.** Bergseth, S. (Statoil (Norway)). Norsk Petroleumsforening, Oslo (Norway). 1994. 10p. (CONF-9408229–9: ONS '94: 11. international Offshore Northern Seas conference and exhibition, Stavanger (Norway), 23-26 Aug 1994). Order Number DE95766578. Source: OSTI; NTIS.

The conference paper describes some historical trends explaining the position of the Norwegian continental shelf (NCS) today and the challenges faced in the years to come. The paper discusses the Norwegian oil industry long term ambitions and objectives together with key principles to achieve these ambitions. The main objectives are to reduce the total field development costs by 30-40% compared to projects carried out before 1994, and to maintain the present standard of safety and quality. The key principles comprise the development of new supplier relations and technology concepts involving extended reach drilling, floating production units, and multiphase transportation technology. Examples are given through the Sleipner West field and the Norne field development projects.

15707 (NEI-SE–197) **SFS 1994:1776 Act of 20 December 1994 on taxes on energy.** Sweden. 29 Dec 1994. 24p. (In Swedish). Order Number DE95766705. Source: OSTI; NTIS.

The taxes introduced 1995 for fuels include an energy tax, a carbon dioxide tax and a sulfur tax proportional to the sulfur content of the fuel, for electric energy a kWh tax differentiated for consumer categories. Taxes on gasoline and fuel oils are divided in different environmental classes according to a.o. their content of aromatic hydrocarbons. The energy tax is for gasoline 3.22-3.81 SEK/liter, for fuel oils 577-1910 SEK/cubic meter, for natural gas 1498 SEK/1000 cubic meter (as a propellant) and 187 SEK/1000 cubic meter (other application), for coal and petroleum coke 245 SEK/ton; the carbon dioxide tax is 0.79, 982, 725, and 854 SEK respectively. The energy tax on electric energy is 0.01-0.09 SEK/kWh, the lowest amount for industry.

15708 (SR/OOG–94-02/1) **The Energy Information Administration's assessment of reformulated gasoline. Volume 1.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 28 Sep 1994. 103p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009451. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

This report is divided into two volumes. The first volume contains EIA's findings and analyses on reformulated gasoline as it affects the petroleum industry. The data contained herein should assist members of the Congress, Federal, State and local governments, analysts, researchers, the media and academia to understand the RFG program and the current status of implementation. This second volume contains 10 appendices that include letter from Congressman Dingell, survey results, survey forms, and historical summary data. A glossary and a list of acronyms and abbreviations are printed in Volumes 1 and 2.

15709 (SR/OOG–94-02/2) **The Energy Information Administration's assessment of reformulated gasoline. Volume 2.** USDOE Energy Information Administration, Washington, DC (United States). Office of Oil and Gas. 29 Sep 1994. 157p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009452. Source: OSTI; NTIS; INIS; GPO; GPO Dep.

15710 (DOE/BP–2522) **1994 Pacific Northwest loads and resources study.** USDOE Bonneville Power Administration, Portland, OR (United States). Dec 1994. 105p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009171. Source: OSTI; NTIS; GPO Dep.

The 1994 Pacific Northwest Loads and Resources Study presented herein establishes a picture of how the agency is positioned today in its loads and resources balance. It is a snapshot of expected resource operation, contractual obligations, and rights. This study does not attempt to present or analyze future conservation or generation resource scenarios. What it does provide are base case assumptions from which scenarios encompassing a wide range of uncertainties about BPA's future may be evaluated. The Loads and Resources Study is presented in two documents: (1) this summary of Federal system and Pacific Northwest region loads and resources and (2) a technical appendix detailing the loads and resources for each major Pacific Northwest generating utility. This analysis updates the 1993 Pacific Northwest Loads and Resources Study, published in December 1993. In this loads and resources study, resource availability is compared with a range of forecasted electricity consumption. The Federal system and regional analyses for medium load forecast are presented.

15711 (DOE/SWPA–9501) **The energy behind the power. Southwestern Power Administration 1994 annual report.** USDOE Southwestern Power Administration, Tulsa, OK (United States). [1994]. 50p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009327. Source: OSTI; NTIS; GPO Dep.

This is the Southwestern Power Administration 1994 annual report. The topics of the report include a letter to the secretary; an overview including the mission statement, a description of the Southwestern Federal Power System, financial statement, performance measurements, national performance review; year in review, summary of results, financial and statistical data and the Southwestern Power Administration Organization.

15712 (NEI-DK–1959) **Integrated resource planning. From the idea to the tool. Main report.** Jysk-Fynske Elsamarbejde (ELSAM), Fredericia (Denmark); ELKRAFT A.m.b.A., Ballerup (Denmark). Oct 1994. 213p. (In Danish). Order Number DE95772382. Source: OSTI; NTIS.

The Danish cooperative electric utilities ELSAM and ELKRAFT and power distribution companies NESA and HEF/ELSAM have developed the integrated resource planning (IRP) according to international criteria and adjusted it to the Danish situation in the field of electric power supply. The purpose is to develop and improve the knowledge, methods and calculation tools, useful in planning tasks. Realistic and relevant calculation problems are given to demonstrate the function of the methods recommended here. A software and a database is established. This project should not be considered as the source of an integrated resource plan for the participating companies, it is meant to discuss the charges and social economy, demand side management (DSM), production and transmission, environmental aspects, consumer expectations etc., in terms of the Danish experience. Electric utilities should be serviced by a few special computer centers, analyzing current IRP/DSM values and optimizing their activities. These centers should apply the same software in order to improve their efficiency and comparability. (EG)

2980 Consumption and Utilization

15713 (DOE/BP–2524) **1994 Pacific Northwest loads and resources study. Technical appendix: Volume 1.** USDOE Bonneville Power Administration, Portland, OR (United States). Dec 1994. 780p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009161. Source: OSTI; NTIS; GPO Dep.

The 1994 Pacific Northwest Loads and Resources Study establishes the Bonneville Power Administration's (BPA) planning basis for supplying electricity t6 BPA customers. The Loads and Resources Study is presented in two documents: (1) this technical appendix detailing loads and resources for each major Pacific Northwest generating utility; and (2) a summary of Federal system and Pacific Northwest region loads and resources. This analysis updates the 1993 Pacific Northwest Loads and Resources Study Technical Appendix published in December 1993. This technical appendix provides utility specific information that BPA uses in its long-range planning. It incorporates the following for each utility: (1) electrical demand-firm loads; (2) generating resources; and (3) contracts both inside and outside the region. This document should be used in combination with the 1994 Pacific Northwest Loads and Resources Study, published in December 1994, because much of the information in that document is not duplicated here. This BPA planning document incorporates Pacific Northwest generating resources and the 1994 medium load forecast prepared by BPA. Each utility's forecasted future firm loads are subtracted from its existing resources to determine whether it will be surplus or deficit. If a utility's resources are greater than loads in any particular year or month, there is a surplus of energy and/or capacity, which the utility can sell to increase revenues. Conversely, if its firm loads exceed available resources, there is a deficit of energy and/or

capacity, and additional conservation, contract purchases, or generating resources will be needed to meet the utility's load.

15714 (DOE/EIA–0318(92)) **Commercial buildings energy consumption and expenditures 1992.** USDOE Energy Information Administration, Washington, DC (United States). Office of Energy Markets and End Use. Apr 1995. 474p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95009672. Source: OSTI; NTIS; GPO; GPO Dep.

Commercial Buildings Energy Consumption and Expenditures 1992 presents statistics about the amount of energy consumed in commercial buildings and the corresponding expenditures for that energy. These data are based on the 1992 Commercial Buildings Energy Consumption Survey (CBECS), a national energy survey of buildings in the commercial sector, conducted by the Energy Information Administration (EIA) of the US Department of Energy. The statistics include: energy consumption; energy expenditures; location; energy intensities; energy intensities by location; principal building activity; other energy sources; and natural gas transported for the account of others.

15715 (DOE/EIA–M067(95)) **Model documentation report: Residential sector demand module of the National Energy Modeling System.** USDOE Energy Information Administration, Washington, DC (United States). Office of Integrated Analysis and Forecasting. Mar 1995. 224p. Sponsored by USDOE, Washington, DC (United States). Order Number DE95008309. Source: OSTI; NTIS; GPO Dep.

This report documents the objectives, analytical approach, and development of the National Energy Modeling System (NEMS) Residential Sector Demand Module. The report catalogues and describes the model assumptions, computational methodology, parameter estimation techniques, and FORTRAN source code. This document serves three purposes. First, it is a reference document providing a detailed description for energy analysts, other users, and the public. Second, this report meets the legal requirement of the Energy Information Administration (EIA) to provide adequate documentation in support of its statistical and forecast reports according to Public Law 93-275, section 57(b)(1). Third, it facilitates continuity in model development by providing documentation from which energy analysts can undertake model enhancements, data updates, and parameter refinements.

This brochure in popular language informs on the fundamentals and characteristics of all renewable energy uses realized in Germany. Information centers and advisory bureaus are printed out, and information regarding financing and government aid is given. Lists of contacts and some basic terms are appended. (UA)

15717 (INIS-mf–14491) **Renewable energy sources in Bulgaria - current state and trends.** Kolev, K. Energoproekt, Sofia (Bulgaria). 1994. 7p. (In Bulgarian). (CONF-9406318–: Energy forum '94 on the energy problems of Bulgaria, Varna (Bulgaria), 15-17 Jun 1994). Order Number DE95626681. Source: OSTI; NTIS (US Sales Only); INIS.

The over-dependency of Bulgaria on imported fuel stressed the importance of developing a new energy strategy based on energy saving which includes also using renewable energy sources (RES). The target is the substitution of at least 2 percent of the real primary energy consumption with RES by 2010. The author gives a generalized analysis of the available RES in Bulgaria -solar, wind, geothermal, biomass and mini-hydraulic. The potentialities of each source for its usage as a suitable energy supply are pointed out, as well as the current status of research and implementation work, problems connected with legislation, financing and production of particular facilities. The governmental policy concerning RES is considered briefly. A description is given to the project 'Technical and Economical Assessment of Possibilities for Expansion of the RES-part in the Energy Balance of the Country' developed and started in 1994 in the framework of the PHARE program. (orig.).

15718 (NEI-DK–1941) **Plan of action for solar energy 1995-97.** Solenergiudvalget (Denmark). Jan 1995. 30p. (In Danish). Contract ENS-51181-95.0029. Order Number DE95772345. Source: OSTI; NTIS; INIS.

Also available in English.

As part of Denmark's energy policy of utilizing renewable energy sources this plan of management covering 3 years (1995-97) has been produced by the Committee for Solar Energy (Solenergiudvalget) at the request of the Danish Energy Agency. It is stated that during 1992-94 the use of solar energy has developed satisfactorily. Supported by state subsidies, local and national information dissemination campaigns have stimulated sales which have increased from 200 to ca. 2500 solar heating systems annually during the past 7 years. The total number of these systems established in Denmark is 16.000. Resulting energy savings are 0.25% of total energy consumption for space and water heating. Yet some goals have been not yet been reached, the development of passive solar heating integrated in buildings and photovoltaic conversion has not been satisfactory. Attention should now be concentrated on these latter aspects but priority should still be given to active solar heating systems. Traditional suppliers should now be included in information dissemination activities. It is reckoned that state subsidies should no longer be necessary for solar energy promotion shortly after 1997, but this form of economical aid should be withdrawn gradually as development within this field continues. Standard subsidies should not be donated regionally. More details are given of plans for each of the 3 years, and of the the status, potentials and barriers for usage of solar energy in Denmark. Detailed lists are offered of available authorized Danish solar heating systems in relation to manufacturers. (AB)

15719 (NEI-DK–1965) **Plan of management for renewable energy 1995-97.** Energistyrelsen, Copenhagen (Denmark). VE-Raadet. Dec 1994. 94p. (In Danish). Order Number DE95772395. Source: OSTI; NTIS.

The Danish plan of management for the use of renewable energy sources is described in detail. It is planned that the use of renewable energy should be increased from 5% (in 1990) to 10% of total energy use in Denmark by 2005 in order to contribute to a reduction of carbon dioxide emission by a minimum of 20% by 2005. It is suggested that the latter goal could be reached more speedily if the increase in use of renewable energy sources should be even greater. In the short term, a number of renewable energy systems are not competitive with existing systems with regard to prices. The fluctuating nature of solar and wind resources demand the development of economical storage systems. There are also a number of organizational and institutional barriers to the increased use of renewable energy sources in Denmark. It is suggested that the technological prerequisites are present with regard to a speedy development of solar and wind energy facilities and that any barriers could by tackled using political initiatives. The recommendations of the Committee for Renewable Energy are given in detail especially in relation to the use of wind turbines, solar heating systems, methane from biomass, heat pumps and wave power. General issues on the promotion of Danish industry and exports and related to carbon dioxide are also dealt with. (AB)

15724 (DOE/ET/15601–T70) **Potassium emission absorption system. Topical report 12.** Bauman, L.E. Mississippi State Univ., MS (United States). Diagnostic Instrumentation and Analysis Lab. [1995]. 111p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-80ET15601. Order Number DE95009826. Source: OSTI; NTIS; GPO Dep.

The Potassium Emission Absorption System is one of the advanced optical diagnostics developed at Mississippi State University to provide support for the demonstration of prototype-scale coal-fired combustion magnetohydrodynamic (MHD) electrical power generation. Intended for application in the upstream of an MHD flow, the system directly measures gas temperature and neutral potassium atom number density through spectroscopic emission absorption techniques. From these measurements the electron density can be inferred from a statistical equilibrium calculation and the electron conductivity in the MHD channel found by use of an electron mobility model. The instrument has been utilized for field test measurements on MHD facilities for almost a decade and has been proven to provide useful measurements as designed for MHD nozzle, channel, and diffuser test sections. The theory of the measurements, a system description, its capabilities, and field test measurement results are reported here. During the development and application of the instrument several technical issues arose which when addressed advanced the state of the art in emission absorption measurement. Studies of these issues are also reported here and include: two-wavelength measurements for particle-laden flows, potassium D-line far wing absorption coefficient, bias in emission absorption measurements arising from dirty windows and misalignments, non-coincident multiwavelength emission absorption sampling errors, and lineshape fitting for boundary layer flow profile information. Although developed for NLHD application, the instrument could be applied to any high temperature flow with a resonance line in the 300 to 800 nm range, for instance other types of flames, rocket plumes or low temperature plasmas.

15725 (DOE/ET/15601–T71) **Particle size distribution instrument. Topical report 13.** Okhuysen, W.; Gassaway, J.D. Mississippi State Univ., MS (United States). Diagnostic Instrumentation and Analysis Lab. [1995]. 64p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC02-80ET15601. Order Number DE95009827. Source: OSTI; NTIS; GPO Dep.

The development of an instrument to measure the concentration of particles in gas is described in this report. An in situ instrument was designed and constructed which sizes individual particles and counts the number of occurrences for several size classes. Although this instrument was designed to detect the size distribution of slag and seed particles generated at an experimental coal-fired magnetohydrodynamic power facility, it can be used as a nonintrusive diagnostic tool for other hostile industrial processes involving the formation and growth of particulates. Two of the techniques developed are extensions of the widely used crossed beam velocimeter, providing simultaneous measurement of the size distribution and velocity of articles.

3003 Thermoelectric Generators

Refer also to citation(s) 15230

15726 (IS-M–810) **An experimental search for high ZT semiconductors: A survey of the preparation and properties of several alloy systems.** Han, S.H.; Cook, B.A. Ames Lab., IA (United States). [1994]. 5p. Sponsored by USDOE, Washington,

DC (United States). DOE Contract W-7405-ENG-82. (CONF-940830–4: 13. international conference on thermoelectrics, Kansas City, MO (United States), 30 Aug - 1 sep 1994). Order Number DE95010232. Source: OSTI; NTIS; GPO Dep.

A survey was conducted of several alloy systems identified as having certain properties thought to be desirable in high figure-of-merit thermoelectric materials. The systems examined include the cerium and lanthanum borocarbides, yttrium nitrides, osmium silicides, and titanium sulfides. Various approaches to the preparation of these alloy systems were explored including vapor transport, arc melting, and mechanical alloying. Among these systems, the borocarbides were found to exhibit p-type conductivity but generally suffered from relatively high carrier concentrations (on the order of $10^{21}/cm^3$) and low mobilities (≤ 10 cm^2/V-s). Both carbon and sulfur dopants produced the highest figure of merit ($0.13 \times 10^{-3}/°C$) in the yttrium nitride system at room temperature. Excess silicon was observed to increase carrier concentration and Hall mobility in osmium disilicide while additions of chromium were observed to stabilize the $OsSi_2$ crystal structure. Electrical power factors comparable to state of the art silicon-germanium alloys were achieved in titanium disulfide, however, the electrical transport properties were found to be critically dependent upon the amount of excess Ti in $Ti_{1+x}S_2$.

15727 (IS-M–811) **Development of improved p-type Si-20 at. % Ge by addition of fullerite.** Cook, B.A.; Harringa, J.L. Ames Lab., IA (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. (CONF-940830–3: 13. international conference on thermoelectrics, Kansas City, MO (United States), 30 Aug - 1 sep 1994). Order Number DE95010230. Source: OSTI; NTIS; GPO Dep.

In a series of experiments designed to evaluate the possibility of lowering the lattice thermal conductivity of silicon-germanium alloys through the formation of an inert, intragrannular nanophase, a number of p-type Si-20 at. % Ge alloys, with a nominal doping level of 0.5 at. % boron, were prepared with varying amounts of fullerite, a mixture of 90% C_{60} + 10% C_{70} with a particle size of 0.7 nm. The alloys were synthesized by mechanical alloying (MA) and the fullerite was added at various stages of the preparation sequence. Compacts consolidated by hot pressing at temperatures of 1200 to 1265 C were found to be fully dense and homogeneous. Each compact was characterized by Hall effect at room temperature and also by electrical resistivity, Seebeck coefficient, and thermal diffusivity measurements to 1000 C. A reduction in thermal conductivity of up to 22% compared to standard p-type alloys was observed in samples containing 0.8 wt % additions. In this study, a maximum integrated average figure of merit, Z, between 300 and 1000 C of 0.65×10^{-3} $°C^{-1}$ was obtained, corresponding to 0.4 wt % addition of fullerite. Observation of selected samples by transmission electron microscopy revealed that the fullerite reacted with silicon to form nanophase SiC inclusions.

15728 (IS-M–813) **Fabrication of improved SiGe alloys for an 18-couple module test.** Loughin, S. (Martin Marietta Astro Space, Philadelphia, PA (United States)); Nakahara, J.F.; Centurioni, D.X.; Cook, B.A.; Harringa, J.L. Ames Lab., IA (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. (CONF-950110–20: 12. symposium on space nuclear power and propulsion, Albuquerque, NM (United States), 8-12 Jan 1995). Order Number DE95010238. Source: OSTI; NTIS; INIS; GPO Dep.

N- and p-type $Si_{0.78}Ge_{0.22}$ alloys were fabricated to determine if recently reported improvements in the figure-of-merit, Z, could be realized in devices. These will be tested in an 18-couple module to directly compare the performance of these materials with that of standard coarse-grain SiGe used in flight programs. We describe the synthesis by vacuum casting and hot pressing p-type SiGe and mechanical alloying and hot-isostatic pressing n-type SiGe. Improved materials and standard materials are characterized and compared. The integrated average figures-of-merit (573–1273 K) of the improved materials were $Z_p = 0.59 \times 10^{-3}$ K^{-1} and $Z_n = 0.85 \times 10^{-3}$ K^{-1} compared with $Z_p = 0.52 \times 10^{-3}$ K^{-1} and $Z_n = 0.76 \times 10^{-3}$ K^{-1} for the standard materials. We also report the power factors for improved and standard materials removed from fabricated devices to gain insight as to how subsequent processing impacts performance.

3005 Fuel Cells

This document provides the functional design criteria for an addition to the 222-S facility. This project will provide space for manipulator repair, equipment and manipulator decontamination and laundry storage. The manipulator repair and storage area will provide for storage of 20 manipulators, an area for receiving potentially contaminated manipulators and an area for the repair of manipulators. The decontamination area will be capable of decontamination of manipulators and shipping casks, pigs, T-handle carriers and other shipping containers. The laundry storage area will provide space for potentially contaminated and clean laundry.

15730 (DOE/METC/C–95/7170) **Solid oxide fuel cell commercialization in the United States.** Williams, M.C. USDOE Morgantown Energy Technology Center, WV (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). (CONF-9506143–1: 1995 Department of Energy/Agency of Industrial Science and Technology international fuel cell symposium, Yokohama (Japan), 12-16 Jun 1995). Order Number DE95008210. Source: OSTI; NTIS; GPO Dep.

This paper discusses aspects of solid oxide fuel cell (SOFC) technology commercialization in the US. It provides the status of the major SOFC developments occurring in the US by addressing both intermediate- and high-temperature SOFC's, several SOFC designs, including both planar and tubular, and SOFC system configurations. This paper begins with general characteristics, proceeds with designs and system configurations, and finishes with a discussion of commercialization, funding, and policies. The US Department of Energy's (DOE) Morgantown Energy Technology Center (METC) is the lead US DOE center for the implementation of a Research, Development, and Demonstration Program to develop fuel cells for stationary power. METC's stakeholders include the electric power and gas industries, as well as fuel cell developers and others. This paper offers some new perspectives on SOFC development and commercialization which come from the broad consideration of the commercialization efforts of the entire fuel cell industry.

15731 (AUC-IBT-R–9335) **Model experiments in 1990 and on-site validation in 1992 of the air movement in the Danish Pavilion in Seville.** Indoor Environmental Technology Paper, 32. Fox, S.G.; Nielsen, P.V. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Oct 1993. 6p. (CONF-930701–10: 6. international conference on indoor air quality and climate, Helsinki (Finland), 4-8 Jul 1993). Order Number DE95772410. Source: OSTI; NTIS.

The purpose of the paper is to present the ventilation design concept, the model experiment results and the final measured values from the Danish Pavilion project. The reason for presenting these values is that the Danish Pavilion's indoor air climate was

excellent and the architecture outstanding, despite the facts that the indoor pollution load was high (smoking, perfumes, tightly packed people) and the ventilation system was cheap and simple. It is suggested that the combination of higher air temperatures and higher air velocities, 'summer breeze design', as used in the Danish Pavilion,may be applicable and cost effective in other building projects. (au)

15732 (AUC-IBT-R–9338) **Draught risk from cold vertical surfaces.** Indoor Environmental Technology Paper, 35. Heiselberg, P. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Oct 1993. 6p. (CONF-930701–9: 6. international conference on indoor air quality and climate, Helsinki (Finland), 4-8 Jul 1993). Order Number DE95772411. Source: OSTI; NTIS.

Glazed facades and atria have had a boom in the 1980's as an architectural feature in building design. Natural convective flows from these cold surfaces are in winter time, however, often the cause of thermal discomfort and there is a need for research to improve the design methods. The objective of the research is to develop expression for the airflow beyond the floor area, which influences the thermal comfort in the occupied zone. Measurements of velocities and temperatures are carried out in a two-dimensional test case. They show that the characteristics of the flow in the near floor region are very similar to the characteristics of stratified flows. Expressions have been developed for the rate of decrement of the maximum velocity with distance from the surface and for the maximum temperature difference between the cold airflow along the floor and the rest of the occupied zone. (au)

15733 (AUC-IBT-R–9339) **Model experiments for the determination of airflow in large spaces.** Indoor Environmental Technology Paper, 36. Nielsen, P.V. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Oct 1993. 6p. (CONF-930701–11: 6. international conference on indoor air quality and climate, Helsinki (Finland), 4-8 Jul 1993). Order Number DE95772412. Source: OSTI; NTIS.

Model experiments are one of the methods used for the determination of airflow in large spaces. This paper will discuss the formation of the governing dimensionless numbers. It is shown that experiments with a reduced scale often will necessitate a fully developed turbulence level of the flow. Details of the flow from supply openings are very important for the determination of room air distribution. It is in some cases possible to make a simplified supply opening for the model experiment. (au) (12 refs.)

15734 (AUC-IBT-R–9351) **Numerical prediction of buoyant air flow in livestock buildings.** Indoor Environmental Technology Paper, 37. Svidt, K. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Dec 1993. 8p. (CONF-9307218–1: 4. international livestock environment symposium, Coventry (United Kingdom), 6-9 Jul 1993). Order Number DE95772413. Source: OSTI; NTIS.

In modern livestock buildings air distribution and air quality are important parameters to animal welfare and to the health of full-time employees in animal production. Traditional methods for calculating air distribution in farm buildings are mainly based on formulas for air jets which do not include the effect of room geometry, obstacles or heat sources. This paper describes the use of Computational Fluid Dynamics to predict air flow patterns and temperature distribution in a ventilated space. Good agreement is found when results of numerical predictions are compared with experimental data. (au) (14 refs.)

15735 (AUC-IBT-R–9454) **The effect of obstacles on the boundary layer flow at a vertical surface.** Indoor Environmental Technology Paper, 46. Heiselberg, P.; Overby, H.; Bjoern, E. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Dec 1994. 10p. Contract ENS-1213/93-0014. (CONF-9410340–1: 5. expert meeting in special topic presentation at forum, Leamington Spa (United Kingdom), 25-29 Oct 1994). Order Number DE95772409. Source: OSTI; NTIS.

EFP-93.

Glazed facades may cause thermal discomfort due to downdraught. Convectors places close to the facade can prevent downdraught but cause an increase in the energy consumption. The objective of the research has been to investigate if the structural system of a glazed facade can be used to reduce downdraught and to avoid thermal comfort problems in the occupied zone. The effect of large obstacles on a cold boundary layer flow has been investigated for different temperature differences between a cold surface and the room air, different distances between the obstacles and different sizes of the obstacles. The effect of the obstacles on the boundary layer flow depended on the characteristics of the flow and of the sizes of the obstacles. With turbulent flow and an obstacle larger than the boundary layer thickness the boundary layer flow separated from the surface and a new boundary layer was established below the obstacle. The risk of thermal discomfort due to downdraught was reduced considerably. (au)

15736 (AU-IBT-R–9407) **Investigation of inlet boundary conditions for numerical prediction of air flow in livestock buildings.** Indoor Environmental Technology Paper, 38. Svidt, K. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Mar 1994. 10p. (CONF-9406327–1: ROOMVENT '94: 4. international conference on air distribution in rooms, Cracow (Poland), 15-17 Jun 1994). Order Number DE95772404. Source: OSTI; NTIS.

In modern livestock buildings the design of ventilation systems is important in order to obtain good air distribution. The use of Computational Fluid Dynamics for prediction of the air distribution makes it possible to include the effect of room geometry and heat sources in the design of ventilation systems. This paper presents numerical prediction of air flow compared with laboratory measurements. A commercial air inlet device for livestock buildings was used in the experimental set-up. In the numerical predictions special attention was paid to the specification of boundary conditions for this type of inlet. (au) (15 refs.)

15737 (AU-IBT-R–9416) **Air distribution in rooms. Research and design methods.** Indoor Environmental Technology Paper, 41. Nielsen, P.V. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Jul 1994. 19p. (CONF-9406327–2: ROOMVENT '94: 4. international conference on air distribution in rooms, Cracow (Poland), 15-17 Jun 1994). Order Number DE95772405. Source: OSTI; NTIS.

The research on air distribution in rooms is often done as full-size investigations, scale-model investigations or by Computational Fluid Dynamics (CFD). New activities have taken place within all three areas and this paper draws comparisons between the different methods. The outcome of the IEA (International Energy Agency) sponsored research 'Air Flow Pattern within Buildings' is used for comparisons in some parts of the paper because various types of experiments and many countries are involved. The trend in design methods is illustrated by full-size experiments, model experiments, CFD-methods and flow element methods. The CFD-method has grown in popularity for large projects but the flow element method is still developing for the more general situations. (au) (18 refs.)

15738 (AU-IBT-R–9417) **Measurement and calculation of vertical temperature gradients in rooms with convective flows.** Indoor Environmental Technology Paper, 42. Overby, H. (CONF-9406327–3: ROOMVENT '94: 4. international conference on air distribution in rooms, Cracow (Poland), 15-17 Jun 1994). Order Number DE95772406. Source: OSTI; NTIS.

EFP-93.

The paper deals with experimental and theoretical examinations of the vertical temperature gradient in rooms with convective flows under transient conditions. The measurements are carried out in a laboratory test room of three different sizes. A small room (7.25 m^2) with a normal room height of 2.4 m (only the result of this experiment is described in the paper), a small room with a large room height of 3.3 m and a room (10.70 m^2) with a room height of 3.3 m. For normal rooms with only convective air flows it is concluded that it is possible to find two dimensionless temperature profiles, one for periods with rising air temperatures and one for periods with falling air temperatures (heating/cooling periods). The dimensionless gradients are possibly independent of the room dimension because of the turbulence intensity in the boundary layer. By using the dimensionless temperature profiles it is possible to find the horizontal location of a simulated mean air temperature and with a good approximation it is possible to determine the actual vertical

temperature profile, even under transient conditions, if only two air temperatures are known (simulated), an air temperature in an upper zone and lower zone of the room, respectively. Furthermore, it is concluded that this is a better description of the vertical temperature gradient than a linear description, which is often used when only two air temperatures are known. (au) (13 refs.)

15739 (AU-IBT-R–9427) **Interaction between flow elements in large enclosures.** Indoor Environmental Technology Paper, 44. Heiselberg, P. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Sep 1994. 14p. Contract ENS-1213/93-0014. (CONF-9406327–4: ROOMVENT '94: 4. international conference on air distribution in rooms, Cracow (Poland), 15-17 Jun 1994). Order Number DE95772407. Source: OSTI; NTIS.

EFP-93.

Several sources for the air movement in large enclosures as for example diffusers, pressure difference around the construction, cold downdraught and thermal plumes make it difficult to use simplified design methods for the air distribution system as the methods based on thrown of jets and penetration depths of non-isothermal jets. When those different flow elements at the same time occur in a room they will influence each other and the air flow pattern will depend on the individual strength of each element and the way they act together. The results of model experiments show that the penetration depths and the paths of cold jets in enclosures are not influenced by the presence of distributed heat sources and only slightly influenced by the presence of concentrated heat sources. However, different locations and different strengths of a heat source in an enclosure may result in quite different air flow patterns. It is therefore necessary in cases with heat sources in an enclosure to take the flow from these air movement sources into account in the designing procedure of efficient ventilation systems. (au)

15740 (AU-IBT-R–9430) **Air distribution in animal sheds - computer calculations and simple methods.** Svidt, K. (Den Kgl. Veterniaer- og Landbohoejskole, Inst. for Hysdyrbrug og Husdyrsundhed, Frederiksberg (Denmark)). Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik; Kongelige Veterinaer- og Landbohoejskole, Copenhagen (Denmark). Inst. for Husdyrbrug- og Husdyrsundhed. 1994. 44p. (In Danish). Order Number DE95772417. Source: OSTI; NTIS.

Ventilations systems in barns, stables, cowsheds, pig styes, poultry sheds and byres must ensure the indoor air quality, and the removal of excess heat and moisture produced by the animals or poultry, without producing draughts that could endanger the animals' health. The possibilities for the use of detailed computer calculations on and simulations of, the prediction of air flow and air quality in buildings that shelter livestock are investigated. These methods are described. (AB)

15741 (AU-IBT-R–9446) **Prospects for computational fluid dynamics in room air contaminant control.** Indoor Environmental Technology Paper, 45. Nielsen, P.V. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik. Dec 1994. 20p. (CONF-9409144–1: 4. international symposium on ventilation for contaminant control: from research to practice - from practice to research, Stockholm (Sweden), 5-9 Sep 1994). Order Number DE95772408. Source: OSTI; NTIS.

Fluid dynamics research is strongly influenced by the increasing computer power which has been available for the last decades, and the computation time is also decreasing. This tendency has also influenced indoor environmental technology. Computational Fluid Dynamics (CFD) is not only an important tool for the prediction of flow and contaminant distribution in ventilated spaces, it is also useful for research on local exhaust arrangements such as laboratory fume hoods, paint booths, push-pull systems, canopy hoods etc. Computational Fluid Dynamics for contaminant control is based on different equation systems as is shown. A variety of different developments of numerical method are discussed. A short discussion of the results from the activities sponsored by the International Energy Agency (IEA) during the period 1988 to 1991 is mentioned and the main part of the paper contains results from CFD prediction of contaminant transport in ventilated areas. Contaminant control with local exhaust openings is also dealt with. (AB) (36 refs.)

15742 (CONF-9403214–) **International lighting in controlled environments workshop: Proceedings.** Wisconsin Univ., Madison, WI (United States). [1994]. 393p. Sponsored by USDOE, Washington, DC (United States);Department of Agriculture, Washington, DC (United States);National Aeronautics and Space Administration, Washington, DC (United States);National Science Foundation, Washington, DC (United States);American DOE Contract FG02-93ER20130. From International lighting in controlled environments workshop; Madison, WI (United States); 27-30 Mar 1994. Order Number DE95008170. Source: OSTI; NTIS; GPO Dep.

Lighting is a central and critical aspect of control in environmental research for plant research and is gaining recognition as a significant factor to control carefully for animal and human research. Thus this workshop was convened to reevaluate the technology that is available today and to work toward developing guidelines for the most effective use of lighting in controlled environments with emphasis on lighting for plants but also to initiate interest in the development of improved guidelines for human and animal research. There are a number of established guidelines for lighting in human and animal environments. Development of new lighting guidelines is necessary for three reasons: (1) recent scientific discoveries show that in addition to supporting the sensation of vision, light has profound nonvisual biological and behavioral effects in both animals and humans; (2) federal regulations (EPACT 1992) are requiring all indoor environments to become more energy efficient with a specific emphasis on energy conservation in lighting; (3) lighting engineers and manufacturers have developed a wealth of new light sources and lighting products that can be applied in animal and human environments. The workshop was aimed at bringing together plant scientists and physical scientists to interact in the discussions. It involved participation of biological scientists involved in studying mechanisms of light reactions and those involved in utilizing lighting for production of plants and maintenance of animals in controlled environments. It included participation of physical scientists from universities and government involved in research as well as those from industry involved in producing lamps and in construction of controlled growth facilities. Selected papers are indexed separately for inclusion in the Energy Science and Technology Database.

15743 (CONF-950624–1) **Improving the energy efficiency of refrigerators in India.** Sand, J.R. (Oak Ridge National Lab., TN (United States)); Vineyard, E.A.; Bohman, R.H. Oak Ridge National Lab., TN (United States). [1995]. 38p. Sponsored by USDOE, Washington, DC (United States);Assisting Deployment of Energy Practices and Technologies (ADEPT) Program. DOE Contract AC05-84OR21400. From Annual meeting of the American Society of Heating, Refrigerating and Air-Conditioning Engineers, Inc.; San Diego, CA (United States); 24-28 Jun 1995. Order Number DE95009127. Source: OSTI; NTIS; GPO Dep.

Five state-of-the-art, production refrigerators from different manufacturers in India were subjected to a variety of appliance rating and performance evaluation test procedures in an engineering laboratory. Cabinet heat loss, compressor calorimeter, high-ambient pull-down, and closed-door energy consumption tests were performed on each unit to assess the current status of commercially available Indian refrigerators and refrigerator component efficiencies. Daily energy consumption tests were performed at nominal line voltages and at 85% and 115% of nominal voltage to assess the effect of grid voltage variations. These test results were also used to indicate opportunities for effective improvements in energy efficiency. A widely distributed "generic" computer model capable of simulating single-door refrigerators with a small interior freezer section was used to estimate cabinet heat loss rates and closed door energy consumption values from basic cabinet and refrigeration circuit inputs. This work helped verify the model's accuracy and potential value as a tool for evaluating the energy impact of proposed design options. Significant differences ranging from 30 to 90% were seen in the measured performance criterion for these "comparable" refrigerators suggesting opportunities for improvements in individual product designs. Modeled cabinet heat loadings differed from experimentally extrapolated values in a range from 2–29%, and daily energy consumption values estimated by the model differed from laboratory data by as little as 3% or as much as 25%, which indicates that refinement of the model may be needed for

this single-door refrigerator type. Additional comparisons of experimentally measured performance criteria such as % compressor run times and compressor cycling rates to modeled results are given. The computer model is used to evaluate the energy saving impact of several modest changes to the basic Indian refrigerator design.

15744 (CTH-PUBL–93-8) **Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.** Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. 157p. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). Order Number DE95766686. Source: OSTI; NTIS.

In the Nordic countries it has been decided to stop the use of CFC-gases in polymeric materials. This decision primarily affects Polyurethane Cellular Plastics (PUR-foam). As a blowing agent for PUR foam CFC has ensured an excellent type of insulation materials and good mechanical properties. The ban of CFC is a very big challenge to both industry and users of PUR foam. Thus, the need for new materials and techniques is great. This seminar was planned in order to give scientists, technicians and users of PUR-foam an opportunity for exchanging new ideas and experience. The seminar comprised of three sessions. 1. Status and experience (6 papers), 2. Technical solutions (7 papers), and 3. Future possibilities (5 papers). Separate abstracts have been prepared for 16 of the 18 papers.

15745 (DOE/GO–10095-073) **Tomorrow's energy today for cities and counties: Build up energy savings with residential standards.** National Renewable Energy Lab., Golden, CO (United States). Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95000290. Source: OSTI; NTIS; GPO Dep.

The paper reveals residential energy efficiency standards that will pay financial and environmental dividends to local communities.

15746 (DOE/GO–10095-074) **Tomorrow's energy today for cities and counties.** National Renewable Energy Lab., Golden, CO (United States). Feb 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95000291. Source: OSTI; NTIS; GPO Dep.

The document focuses on the use of commercial building energy codes to promote energy efficiency and achieve cost savings in communities. Energy conservation codes used in Montgomery County, Maryland and San Francisco, California are used as examples.

15747 (DOE/GO–10095-129) **FEMP: What's new in Federal Energy Management.** National Renewable Energy Lab., Golden, CO (United States). Mar 1995. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE94000228. Source: OSTI; NTIS; GPO Dep.

The modernization of the Federal office building complex at 26 Federal Plaza in New York City includes energy efficiency retrofits in order to meet goals for reducing energy consumed in federal buildings. The Federal Energy Management Program (FEMP) is working with others to renovate the New York complex.

15748 (DOE/R6/99305–T3) **Development of single crystal filaments. Final report.** Milewski, J.V.; Shoultz, R.A.; Bourque-McConnell, M.M. Superkinetic, Inc., Albuquerque, NM (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG46-93R699305. Order Number DE95009807. Source: OSTI; NTIS; GPO Dep.

The program just completed addresses a route to a more efficient longer-lasting electric light bulb filament. All current filaments for light bulbs are metallic in nature. They are subject to embrittlement with age (large grain growth) and relatively high vapor pressures which limits their operating temperature. There is evidence which suggests advantages to using high temperature refractory single crystal fibers as a filament for a light bulb. These refractory materials may include materials such as hafnium or tantalum carbide which have melting points about 500°C higher than tungsten. Another advantage is that single crystal fibers have a very high degree of crystalline perfection with very few voids and dislocations. Without these imperfections, the atomic mobility at high temperatures is highly restricted. Thus single crystal fibers are very stable at high temperature and will last longer. The efficiencies result from running these single crystal ceramic fiber filaments at higher temperatures and the higher emissivity of the carbide filaments compared to tungsten. The amount of visible light is proportional to the 4the power of the temperature thus a 500°C higher operating give about a 3-fold increase in radiation in the visible range. The program accomplishments can be summarized as follows: (1) Single crystal fibers of JfC sufficient crystal quality for light bulb filament applications were made. (2) The HfC fiber furnace growth chamber, power control and data collection system was developed for the laboratory scale plant. (3) method for mounting and apparatuses for testing the single crystal fiber filaments were developed and built.

15749 (ETDE-DE–83) **Measurement, development and comparison of combined systems for heating and ventilation. Final report.** Siegmund, H.; Mazanec, J.; Steimle, F.; Mengede, B. EHT Siegmund GmbH, Bad Honnef (Germany); Essen Univ. (Gesamthochschule) (Germany). Inst. fuer Angewandte Thermodynamik und Klimatechnik. Oct 1992. 27p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0335013A. Order Number DE95770345. Source: OSTI; NTIS (US Sales Only).

Heat losses in ventilation systems are gaining increasing importance, due to the continuing reduction in the heat losses during transmission in buildings. High energy saving potentials can be found by applying suitable heat recovery measures a controlled ventilation systems. Within the framework of this project, heating and ventilation systems could be developed which, with regard to their operational costs and energy used, compare lower to existing systems. The extensive long-term investigations regarding the optimization and determination of general parameters and their tests in pilot projects could reveal both finding about possible fields of application and from the basis of a simplified design- and calculation method. (orig.)

15750 (ETDE-DE–90) **Heating and cooling in small living units. Final report.** Gerlich, A.; Lang, R.; Knoche, K.F. Technische Hochschule Aachen (Germany). Lehrstuhl fuer Technische Thermodynamik und Inst. fuer Thermodynamik. [1993]. 101p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0328890A. Order Number DE95769959. Source: OSTI; NTIS (US Sales Only).

The present article reports on studies on adsorption heat pumps and properties of the zeolite-water system. Specifically, it deals with heat pump cycles; properties of the zeolite-water system; development of a high-capacity adsorber; development of a pilot system; simulation of a modular adsorption heat pump; and commercialisation of a laboratory system. (HW)

15751 (ETDE-DE–91) **Heat pumps within the concept of non-conventional heat supply.** Albring, P.; Heinrich, G.; Pietsch, A. Institut fuer Luft- und Kaeltetechnik GmbH, Dresden (Germany). 1993. 16p. (In German). Order Number DE95770323. Source: OSTI; NTIS (US Sales Only).

The paper describes possible ways of improving heat pump processes for space heating using small-type heat pumps. The great potential of an economically efficient use of heat pumps lies in the use of favourable heat sources and design of heating installations adapted to heat pumps. The fact that the costs for heating installations equipped with heat pumps are comparable with those for conventional heating installations is demonstrated by an example. (orig./UA)

15752 (ETDE-DE–92) **System-adapted electronic devices (SAGE). Final report.** Koscielny, F.G. Selected Electronic Technologies GmbH (SET), Wedel (Germany). Dec 1992. 14p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0328813A. Order Number DE95770343. Source: OSTI; NTIS (US Sales Only).

Within the framework of the RandD project reliable and cost efficient electronic circuits and concepts have been developed for system control units, electronic ballasts for energy saving lamps and inverters. In part 1 a twilight-time-switch was realized. By

means of the LME (Load Management Electronic) the system efficiency of AC systems could be increased because there is no need to design the inverters to the peak-load. Finally the investigation of electronic ballasts resulted in a new concept based on pure DC circuits. (orig.)

15753 (IEE-SR–256) **Influence of a household' holding more than one home-use air conditioners on the demand for air cooling. From the survey of the actual status of air conditioner use.** Institute of Energy Economics, Tokyo (Japan). Aug 1994. 85p. (In Japanese). Order Number DE95764071. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

The paper investigates the actual status of home-use air conditioners used at a peak time. A relation is studied between the number of a household's holding air conditioners and the actual status of use. Influence of a household's holding more than one air conditioners on the demand for home-use air cooling is considered by making a comparative analysis of predetermined temperatures by room and the room situation such as a living room, and a bed room and children's room for which air conditioners purchased second or after are mostly used. As a result, it is found that in the daytime, about 10% of the households use more than one air conditioners at the same time, and about 50% use only one, and that as the number of holding air conditioners increases, the number of air conditioners which work as the second or the third increases. The conclusion obtained is that the grasp of the present status, future spread and potential of air conditioner use by room will contribute to future growth of the demand for home-use air cooling in the daytime. However, it is thought that with advent of the aged society, great changes will be seen in constituent members of the family, construction of the house and life style. 73 figs., 40 tabs.

15754 (KTH-BYT-AR–93-1) **The Stockholm project, block Konsolen. Energy concept evaluation of apartment houses with solar wall, heavy frame, and heat pump.** Eriksson, S.O. Royal Inst. of Tech., Stockholm (Sweden). Dept. of Building Technology. 1993. 105p. (In Swedish). Project BFR-870739-3. Order Number DE95766697. Source: OSTI; NTIS.

The Stockholm project is a full scale research project which, in few words, will contribute to a new generation of energy efficient apartment buildings. The project contains six houses in which 'Konsolen' is one. The block of Konsolen consists of two L-formed, four storey balcony access buildings with altogether 57 flats. It was built with prefabricated concrete elements. The energy concepts evaluated in Konsolen are: - The Solar wall. A solar collector integrated with an outer wall construction where the supply air is preheated by solar energy striking the wall. - The Heavy frame. The buildings have a high thermal mass. This has been used to downsize the power of the heating system. Normally, this kind of building is dimensioned for a design outdoor temperature of -18 degrees C. In this case, -13 degrees C has been used. - The Heat pump. A heat pump takes heat from the exhaust air and dumps it into the domestic hot water system or the radiator system. A great part of the evaluation work was long time measurements. The buildings have been extensively monitored. Data concerning energy use, indoor temperatures and weather have been collected as hourly averages during almost four years. Results from Konsolen and the other buildings in the Stockholm Project show that it is possible to significantly decrease the heating demand in new multi-family buildings. The results also show an increase of electricity usage, especially for building services. This highlights the importance of careful inspections and trimming of building services. 20 refs, 40 figs, 6 tabs

15755 (LBL-PUB–758) **From the lab to the marketplace: Making America's buildings more energy efficient.** Lawrence Berkeley Lab., CA (United States). Jan 1995. 42p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC03-76SF00098. Order Number DE95008445. Source: OSTI; NTIS; GPO Dep.

Since the mid 1970s, DOE has invested some $70 million in research and development at Lawrence Berkeley Laboratory (LBL) for energy-efficiency studies of advanced building technologies. That investment has helped spawn a $2.4-billion US market for key products – energy-efficient lighting and advanced window coatings – and efficiency standards for residential equipment and computerized tools for more efficient building design. By 1993 DOE's initial investment had reduced consumers' energy bills by an estimated $5 billion ($1.3 billion in 1993 alone). By 2015 the authors estimate that the products of that investment will save consumers $16 billion annually. But LBL research partnerships address a host of other building technology issues as well-building technology issues whose economic benefits are less easy to quantify but whose overall worth is equally important. They analyze public policy issues such as the role of efficiency options as a mitigation strategy for global climate change. They develop planning and demand-management methodologies for electric and gas utilities. They identify technologies and analytical methods for improving human comfort and the quality of indoor air. They contribute to the information superhighway. They focus on the special problems and opportunities presented by energy use in the public sector. And they do all these things at the local, national, and international levels. At LBL, they are part of the multi-laboratory, interdisciplinary approach to building technology research supported by DOE's Office of Energy Efficiency and Renewable Energy. They also participate in buildings-related research supported by DOE's Office of Health and Environmental Research, other federal agencies, and industry. This document describes LBL's role within this wider effort.

15756 (NEI-DK–1879) **Thermo logica. Analysis of measurements.** Kloch (N.P.), Nivaa (Denmark). Dec 1994. 120p. (In Danish). Contract ENS-1213/91-0019. Order Number DE95766438. Source: OSTI; NTIS.

EFP-91.

An analysis of measurements taken on a house constructed for testing purposes related to energy conservation. The measured data are included in the form of numerous appendices and it is deliberated whether the mode of construction, mainly of the outer walls, was suited for purposes of saving energy. These supporting walls are made of 12 mm steel plates dug down to a depth of 1.5 meters. On the inside the steel plates are insulated with a layer of 400 mm and outside of 50 mm insulation material. Other kinds of construction were demonstrated so that that a number of principles could be tested. The results are described in detail. In relation to the south facade, the heating up of the steel plate from the earth had no influence, but it did in the case of the walls facing other directions, but only at their bases, with no influence regarding heating with regard to the middle part of the outside wall and none at all for the top of it. (AB)

15757 (NEI-DK–1905) **Olf and energy. Phase 3. Renovation of a high olf building to become a low-olf building.** Beuningen, M. van; Clausen, G.; Pejtersen, J.; Fanger, P.O. Danmarks Tekniske Univ., Lyngby (Denmark). Lab. for Varme- og Klimateknik. Dec 1994. 145p. (In Danish). Contract ENS-1213/91-0013. Order Number DE95766549. Source: OSTI; NTIS.

In relation to indoor quality in office buildings the influence of building-related air pollution sources on indoor air quality as perceived by humans and the reliability and validity of the trained-panel method for evaluating air quality in space are studied. Sensory panels (a group of 'naive', or trained, persons who judge air quality by using their noses) were used to quantify the air quality. The theoretical backgrounds of methods used are described, with some emphasis on the concept of environmental psychology which studies the interrelationships of behaviour and environment, using the human information processing model as one of the theoretical frameworks. In addition to the basic concepts of indoor air quality. building-related air pollution sources are discussed. In order to identify the main air pollution sources, explorative investigations were carried out in the building and laboratory experiments were made in order to select intervention measures. The effect of the selected measures on the air quality in the building was studied using the sensory panels of people. A questionnaire survey was performed among the occupants of the building to collect information on their perception of building-related problems/air pollution sources. Recommendations included floor renovation, spray-extraction of carpeted areas, avoidance of high paper loads in a room, improved cleaning, and shading for windows where occupants complained of eye irritations. (AB)

15758 (NEI-DK–1940) **Total energy solution at Skotteparken, Egebjerggaard in Ballerup.** Vejsig Pedersen, P. Cenergia ApS, Ballerup (Denmark). Jan 1995. 80p. (In Danish). Contract ENS-1213/91-0009. Order Number DE95772358. Source: OSTI; NTIS.

EFP-91.

Skotteparken in Egebjerggaard, Ballerup (Denmark) is an experimental building complex comprising 100 low-energy homes using solar heating where the aim is to reduce gas consumption for space and water heating by 60% and also to save electricity and water. The initiatives taken are the use of extra insulation, low emission window glass, heat recovery with regard to ventilation systems, local solar heating systems for domestic water heating and space heating, pulse operation of low-temperature district heating distribution network, local heat and water meters, computerized control and monitoring systems, thermostats on shower facilities and water-saving taps in kitchens and bathrooms, low-energy bulbs and pumps with a low energy consumption and heat supply from the local cogeneration plant. All these initiatives are described in detail. (AB)

15759 (NEI-DK–1958) **Investigation of indoor climate and energy consumption in connection with a pilot project in Roedovre.** Byggestyrelsen, Copenhagen (Denmark). Oct 1994. 119p. (In Danish). Order Number DE95772346. Source: OSTI; NTIS.

A description of an investigation carried out at a block of 51 flats, 'Engen' in Roedovre, Denmark, heated by an air-warming blow-in and ventilation system (also comprising heat recovery) and where each room is equipped with a small electric radiator to enable individual regulation of indoor temperature. The investigation concentrated on energy consumption, indoor climate conditions and consumer satisfaction. The electric radiators were not often used as occupants chose to increase the blow-in temperature which is regulated by the outside temperature so that a large proportion of heating needs were covered by district heating thus increasing energy consumption and resulting in thermal comfort problems. When the electric heaters were turned off the blow-in heat was not enough to warm the cold air near the windows. Occupants complained of draughts. They had highly different demands on thermal comfort (often dependent on age, standard of health etc.) and the location of individual flats also influenced thermal comfort conditions. 30% of occupants were not satisfied with the heating system in winter and 50% complained of irritation of eyes, nose and throat or headaches. On the basis of experience gained at this block of flats a new block was constructed in Vejle. This is described as a functionally separated building system, a column/plate system where all installations are gathered together. The adjustments that were made on the basis of problems experienced in the Roedovre block of flats are described in detail. (AB)

15760 (NEI-DK–1966) **Control of the energy. Status report 1993/94. Description. Analyses and evaluation.** Energistyrelsen, Copenhagen (Denmark). 1995. 37p. (In Danish). Order Number DE95772394. Source: OSTI; NTIS.

As a follow-up of Denmark's energy and environmental policy as presented in the document "Energy 2000 - Plan of Management for a Sustainable Development" (Energi 2000 - Handlingsplan for en baeredygtig udvikling) the State must also contribute to the achievement of the goal of reducing the country's total emission of carbon dioxide by 20% by 2005. In 1992 a campaign, designated "Styr paa energien" (Control of the energy) and involving all State institutions, was initiated. This report presents an account of the status of the campaign which runs for three years and is based on energy efficiency in buildings where State activities are carried out, information dissemination and energy conservation consultancy. Activities undertaken during the campaign per July 1st, 1994, are described in addition to the total energy consumption in buildings where State activities take place for the period 1990-93. The character of this energy consumption is analysed and evaluated. The energy consumption within individual ministries and the question of whether the State sector can achieve the goal of reducing CO_2 emission by 10-15% by 2005 is addressed. (AB)

15761 (NEI-DK–1967) **Control of the energy. Status report 1993/94. Supplement.** Energistyrelsen, Copenhagen (Denmark). 1995. 41p. (In Danish). Order Number DE95772396. Source: OSTI; NTIS.

This supplement to the document of the same main title gives data on energy consumption related to individual ministries within the Danish government in addition to a survey of State institutions and details of investment in energy-saving initiatives. (AB)

15762 (NEI-DK–1973) **Efficient and energy-saving lighting in industrial buildings.** Clausen, V.; Klausen, J. DELTA Lys og Optik, Lyngby (Denmark); Lysteknisk Selskab, Stenloese (Denmark). 1995. 35p. (In Danish). Order Number DE95772370. Source: OSTI; NTIS.

The document, which is illustrated by a number of coloured photographs, gives detailed information on lighting suitable for many types of industrial premises, processes and facilities in connection with employers' working conditions, with special emphasis on the metal, graphic, wood, ship, medicinal, food, and textile industries and canteens. Guidelines are given on the quality of suitable lighting systems which are efficient, energy-saving and attractive. A scheme for the registration of electricity consumption by lighting systems is presented in addition to a short glossary of Danish related terminology. (AB)

15763 (NEI-DK–1975) **Energy management in larger building blocks.** Energistyrelsen, Copenhagen (Denmark). Feb 1995. 78p. (In Danish). Order Number DE95772377. Source: OSTI; NTIS.

It is recommended to initiate energy management in all larger buildings, to set up a new consultancy service to support the energy management as a substitute for the three existing consultancy services for larger properties in Denmark, to ensure that certain minimum payments should be obligatory and to employ the services of an authorized consultant for part of the work. This should give flexibility and all types of energy saving will be covered, energy conservation will be optimized and economic aspects will be improved. The aims of energy management are to influence consumers' behaviour with regard to the use of energy, promote energy efficiency, reveal the possibilities for energy saving resulting from technical innovation/retrofitting. The most important means are control of energy consumption by registration and evaluation of individual consumption, and an annual inspection in the course of which consumers' behaviour related to energy consumption, overall energy consumption in the building, and energy-using systems are evaluated and where new ideas on how to save energy can surface so that an annual energy plan based on previous evaluation can be constructed and suggestions for new initiatives can be gathered together. (AB)

15764 (NEI-DK–1981) **Report on informative electricity bills.** Danske Elvaerkers Forening, Copenhagen (Denmark). Feb 1994. 60p. (In Danish). Order Number DE95772384. Source: OSTI; NTIS.

With regard to Denmark's energy and environmental policies, Danish electric power distribution companies, in connection with measures for saving energy and thus reducing pollution, are currently establishing energy consultancy services, informative public campaigns, the training of consultants, energy surveys, the setting up of energy advisory centers etc. Informative electricity bills are used as a tool in a number of energy saving activities, to inform consumers on the nature of their electricity consumption and so stimulate an interest in saving energy. The concept is described in detail and information is given on earlier initiatives, the current status of existing calculation systems, an evaluation of the technological potentials of meter reading, the sending out of electricity bills and the economic consequences. Examples of ways setting up household electricity bills are given. It is seen as a problem that in some localities bills are sent out that include many services so that attention can be distracted form electricity consumption. In the case of larger industrial firms and public institutions consultancy services are judged to be more effective than informative electricity bills. It is suggested that in the case of household bills gross prices should be stated (including tariffs) and information given on the nature of the energy consumption for the preceding year in addition to tips on how to save electricity. Ideas are also presented regarding electricity bills sent to industrial firms and public institutions, involved computer systems, overall costs and billing and payment systems. (AB)

15765 (ORNL/Sub–91-SK078/1) **National Energy AudiT (NEAT): Users manual.** Krigger, J. (Saturn Resource Management, Helena, MT (United States)); Adams, N.; Gettings, M. Oak Ridge National Lab., TN (United States). Jul 1993. 99p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009937. Source: OSTI; NTIS; GPO Dep.

NEAT (National Energy AudiT), the US DOE's new energy auditing tool, is a program for personal computers that was designed for use by local agencies in the Weatherization Assistance Program. This manual describes in detail the instructions for using the NEAT program.

15766 (SP–95-08) **Thermal insulating materials. Thermal conductivity variations in mineral wool and expanded polystyrene.** Jonsson, B. Swedish National Testing and Research Inst., Boraas (Sweden). 1995. 30p. (In Swedish). Order Number DE95766688. Source: OSTI; NTIS.

Thermal conductivity has been measured by SP since 1965. This has provided a substantial data base of results, from which measurements for different groups of materials have ben compared in order to give an idea of normal variations and mean values. Values for polystyrene, glass fiber, and mineral wool have been statistically investigated. In general, it is the density dependence of the thermal conductivity that has been investigated, although air permeability as an indirect parameter has also been studied. The expression A + B*d + C/d has been employed to describe the thermal conductivity in a porous material, and has been found preferable to other types of polynomials. Systematic differences from the mean curve can be detected by employing the difference between the measured values and the theoretical values (the residual), which provides a means of detecting sub-standard (or super-standard) batches. 12 refs, 13 figs

15767 (UCRL-JC–120680) **Movement of outdoor particles to the indoor environment: An analysis of the Arnhem Lead Study.** Layton, D.W. (Lawrence Livermore National Lab., CA (United States)); Thatcher, T.L. Lawrence Livermore National Lab., CA (United States). Mar 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950646–15: Air and Waste Management Association meeting, San Antonio, TX (United States), 18-23 Jun 1995). Order Number DE95010733. Source: OSTI; NTIS; GPO Dep.

This paper analyzes the role of soil tracking as a source of indoor particles and quantifies key parameters influencing the transport of soil-derived particles (resuspension rates for particulate matter on floors, deposition velocities of suspended particles in indoor and outdoor air). The paper begins with a brief review of studies of particle transport processes and presents a simple model for studying the transport of particles in the indoor environment. The model is used to examine data on Pb distributions in the indoor and outdoor environments of community adjacent to a secondary lead smelter.

15768 (ETDE-DE–77) **Determination of ship and weather dependent drag coefficients for the dimensioning of the main engine and the control of the engine and propeller load on the sea. Final report.** Grossmann, G. (comp.). Technische Univ. Berlin (Germany). Fachbereich 12 - Verkehrswesen; Technische Univ. Berlin (Germany). Inst. fuer Schiffs- und Meerestechnik. Dec 1991. 58p. (In German). Project Number ERP 2621. Order Number DE95769283. Source: OSTI; NTIS (US Sales Only).

The here applied method uses the marine screw propeller as measuring instrument for resistance changes. From ship's logs the mean of the entries of ship's velocity, fuel consumption, motor output and speed of rotation were evaluated in connection with weather and operating conditions. Moreover results of model tests, free-running diagrams of propellers as well as general ship data were used. Ship logs and data of 15 ships of different size were kindly put at our disposal by different German shipping companies. (orig./HW)

15769 (IEE-SR–243) **Modal shift and energy efficiency. Mainly on comparison between truck and railroad.** Institute of Energy Economics, Tokyo (Japan). Aug 1993. 181p. (In Japanese). Order Number DE95769734. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

A comparative study is made on energy efficiency between truck and railroad in cargo transportation. Discussions are developed in terms of zones of transport distance, transport to end users, detour distance caused by modal shift, energy consumption in construction of infrastructure, etc. As a result, in transportation between places excluding transport to end users, traveling energy consumption per transport weight x distance becomes 1.7-2.6 in truck versus 1 in railroad. In transportation including that to end users, no energy-saving effects of conversion to railroad are expected if the distance is short such as about 100-200 km, however advantages of the railroad become greater if the distance is far. Even in the short distance transportation, energy-saving effects are obtained which are comparable to those in the long distance one if including transport to end users when the mean speed is reduced to 30 km/hr, affected by the heavy traffic in the metropolitan area. Since indirect energy in railroad exceeds that in road by 40% on average, total energy/ton-km becomes 70-80 in railroad versus 100 in truck in consideration of this indirect energy. 37 refs., 113 tabs.

15770 (IEE-SR–259) **Analysis of energy consumption in car transportation. Actual status of district transportation (truck) in the metropolitan area, and influence of the NOx law.** Institute of Energy Economics, Tokyo (Japan). Aug 1994. 166p. (In Japanese). Order Number DE95764073. Source: OSTI; NTIS; Available from The Institute of Energy Economics, Dai 10 Mori Biru, 18-1, Toranomon 1-chome, Minato-ku, Tokyo, Japan.

An investigation is conducted to know the actual status of truck transportation in the district (within the prefecture, within the district). The objective for the study is the metropolitan area. In case of comparing trucks with the same maximum load level in the district transportation, there is seen no big difference in loading rate, and it cannot be said that business-use trucks are higher in transport energy efficiency than private-use ones. The lower maximum load level the truck has, the lower the loading rate and energy efficiency become. Enhancement of energy efficiency is difficult in connection with distribution conditions. Notwithstanding the transport volume is decreasing, the traveling distance is not. The number of all the trucks retained remains almost unchanged, but the number of the trucks retained in the service business field increases stably. Accordingly, despite of the transport volume which has recently been reducing, the energy consumption has not decreased. Under regulations on car models by the NOx law, it is predicted that energy consumption in the metropolitan area increases in gasoline by 0.7 million kL and decreases in light oil by 0.5 million kL during a 8-9 year grace period, due to the shift from light oil. The energy consumption increases by 3%, affected by a decline in fuel consumption caused by the shift of car model. 34 refs., 74 figs., 108 tabs.

15771 (INEL–94/00023) **Lunar South Pole ice as heat sink for Lunar cryofuel production system.** Zuppero, A. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Stanley, M.; Modro, S.M.; Whitman, P. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-950110–18: 12. symposium on space nuclear power and propulsion, Albuquerque, NM (United States), 8-12 Jan 1995). Order Number DE95008612. Source: OSTI; NTIS; INIS; GPO Dep.

Recent Clementine bistatic radar data suggest that water ice may be present in a "forever shaded" depression or crater at the South Pole of the Moon. The ice is a feedstock for the electrolysis production of cryogenic oxygen and hydrogen rocket fuels for a transportation system on the moon and for leaving and descending on to the moon. The ice also provides a convective heat sink critical to the practical implementation of high throughput electric power generators and refrigerators that liquefy and cool the oxygen and hydrogen into cryogenic rocket fuel. This brief analysis shows that about a hundred tonnes of hardware delivered to the lunar surface can produce tens of thousands of tonnes of rocket fuel per

year, on the moon. And it makes the point that if convective cooling is used instead of radiative cooling, then power and processing systems can be used that exist and have been tested already. This shortens the time by an order of magnitude to develop lunar operations. Quick deployment of a chemical cryofuel energy source is a key factor in the economics of lunar development.

15772 (INEL–94/00134) **Very Light Rail (VLR) technology - a new, simple, safe, cost-effective environmental solution to meet future transportation needs.** Dearien, J.A. (Idaho National Engineering Lab., Idaho Falls, ID (United States)); Buehrer, M.S. Idaho National Engineering Lab., Idaho Falls, ID (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC07-94ID13223. (CONF-9504129–1: 1995 international symposium on public works and the human environment, Seattle, WA (United States), 19-21 Apr 1995). Order Number DE95008608. Source: OSTI; NTIS; GPO Dep.

An increasing number of papers, government programs, and studies, are directed toward the economics of lighter weight vehicles in mass transit. The objectives of these activities are generally directed toward the increased energy efficiency of the fighter vehicles or the benefits to the infrastructure-less wear, repair, or construction cost, or both. Some systems studies of potential magnetic levitation concepts have minimized the size of the vehicles in order to increase the operational flexibility of the system. CyberTran was designed and developed from the ground up as a small vehicle transportation system with the primary objectives of (1) reducing the capital and operating costs of high speed rail and transit systems and (2) maximizes rider appeal and safety. The potential for significant savings in capital cost with a small vehicle rail system like CyberTran has been evaluated. This paper discusses the operational benefits which can be realized with a rail system based on small, light weight, and computer controlled vehicles. CyberTran was developed at the Idaho National Engineering Laboratory, a U.S. Department of Energy Research and Development Laboratory in Southeastern Idaho.

15773 (ORNL/TM–12799) **Standards and conventions for the Worldwide Port System (WPS) regional Integrated Cargo Database (ICDB).** Loftis, J.P. (Oak Ridge National Lab., TN (United States)); Truett, L.F.; Shipe, P.C.; Faby, E.Z.; Fluker, J.; Grubb, J.W.; Hancock, B.R.; Ferguson, R.A. Oak Ridge National Lab., TN (United States). 28 Feb 1995. 72p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95008693. Source: OSTI; NTIS; GPO Dep.

This document, prepared for the Worldwide Port System (WPS) Regional Integrated Cargo Database (ICDB), provides standards and conventions for the screens developed using ORACLE's SQL*Menu, SQL*Forms, and SQL*Reportwriter; for the ORACLE keys; and for commenting ORACLE code. It also covers standards for database system transfers. The results of adherence to these standards and conventions by all developers at both geographically separated development sites, Oak Ridge National Laboratory (ORNL) and The Military Traffic Management Command's Eastern Area (EA), will be a consistent appearance of ICDB to users, code that is easily maintained, and a system that will be quicker to develop and integrate. This final report of the Standards and Conventions contains general guidelines to be followed for the development of the ICDB user interface screens. Though additional ICDB user interface screens are being developed both at ORNL and EA, and existing screens may have fields added to or deleted from them, the standards and conventions presented in this document should remain unchanged.

15774 (UCRL-ID–118775) **NASA FBL/PBW Program. NASA Boeing 757 HIRF test plan: Low power on-the-ground tests.** Poggio, A. (Lawrence Livermore National Lab., CA (United States)); Zacharias, R.; Pennock, S.; Avalle, C.; Sharpe, R.; Kunz, K.; Meissner, C. Lawrence Livermore National Lab., CA (United States). 7 Oct 1994. 72p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. Order Number DE95010416. Source: OSTI; NTIS; GPO Dep.

The NASA Fly-by-Light/Power-by-Wire (FBL/PBW) program was initiated to develop technology for a future generation of commercial transport aircraft. Studies have shown that an all-electric aircraft (PBW) could have substantial benefits in terms of weight and maintenance costs over today's aircraft that rely on hydraulic and pneumatic controls. However, one major concern regarding the all-electric aircraft is the potential for conducted and radiated electromagnetic susceptibility of its electronic controls. A way to potentially alleviate this problem (and save weight at the same time) is to route all control and signal information over optical fiber control links (FBL) that are inherently easier to harden against the electromagnetic environment (EME). Since electro-optic devices and electronic digital computers will still be required, a major objective of the FBL/PBW program is to develop tools and techniques for assessing the survivability of the modern aircraft using such equipment in the electromagnetic environment. The EME effects assessment tools and techniques developed under the program must ultimately be accepted by industry and the FAA regulatory body to be useful. Therefore, an important aspect of the program is that these tools and techniques must be validated to the satisfaction of this community. A series of aircraft tests are being planned for this purpose. Specifically, low power on-the-ground tests and fly-by tests will be conducted. This test plan describes, in detail, the on-the-ground tests which include those used for generating data for code validation as well as those which support the study of the stirred frequency technique. The test plan for the fly-by tests will be provided in a subsequent document.

15775 (ANL/CHM/CP–84094) **Conversion of holes into reducing species on surface modified small-particle TiO_2.** Micic, O.I. (Argonne National Lab., IL (United States). Chemistry Div.); Ostafin, A.E.; Rajh, T.; Sabelko, J.J.; Thurnauer, M.C.; Tiede, D.M.; Zhang, Y. Argonne National Lab., IL (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950241–3: 5. international symposium on chemical oxidation, Nashville, TN (United States), 15-17 Feb 1995). Order Number DE95008282. Source: OSTI; NTIS; GPO Dep.

Complexation of colloidal titanium dioxide nanoparticles (40 Å) by cysteine as a surface derivative was investigated by electron paramagnetic resonance (EPR) and infra-red (diffusion reflectance infra-red Fourier Transform DRIFT) spectroscopies. It was found that cysteine strongly binds to the colloid surface. The authors have demonstrated with EPR spectroscopy that cysteine modifies the TiO_2 surface with formation of new trapping sites where photogenerated electrons and holes are localized. Illumination of cysteine modified TiO_2 at 77K resulted in formation of a sulfur centered radical observed by EPR spectroscopy at 200 K. Upon addition of lead ions, a new complex of cysteine that bridges surface titanium atoms and lead ions was detected by IR spectroscopy. Illumination of lead/cysteine modified TiO_2 did not result in the formation of sulfur centered radical, but symmetrical, lattice defect type EPR signal for trapped holes was observed. However, addition of methanol to this system resulted in the formation of $\cdot CH_2OH$ radical following illumination at 8.2 K. After the temperature was raised to 120 K, doubling of the signal associated with electrons trapped at particle surface ($Ti(3)_{surf}$) was observed. On further increase of the temperature to 200 K the EPR signal for trapped electrons disappeared as a result of the reduction of Pb^{2+} ions, and metallic lead was observed to precipitate. Conversion of photogenerated holes into trapped electrons due to the presence of methanol doubles the yield of trapped electrons that can reduce Pb^{2+}. Direct reduction of Pb^{2+} ions by $\cdot CH_2OH$ radical on TiO_2 was not detected.

15776 (CRIE-U–94004) **Development of hydroponic system using agriculture waste. 1. Characteristics of rice husk charcoal as growth medium and vegetable growth.** Terazoe, H. (Central Research Institute of Electric Power Industry, Tokyo (Japan)); Nakaya, K.; Okano, T. Central Research Inst. of Electric Power Industry, Tokyo (Japan). Jun 1994. 31p. (In Japanese). Order Number DE95769742. Source: OSTI; NTIS; Available from Central Research Institute of Electric Power Industry, 1-6-1, Otemachi, Chiyoda-ku, Tokyo, Japan.

Experimental researches were made on rice husk charcoals processed to be used as culture media for hydroponics. Rice husk charcoals with a size of 1 mm or larger retaining the original shape of the rice husk, and with a size of smaller than 1 mm were made for use in the experiment. In the culture media made of these rice husk charcoals, the charcoal with a particle size greater than 1 mm had more air portion than water portion at 6 cm above the water level, and the charcoal with a particle size smaller than 1 mm had poor air permeability. According to the result of immersing the rice husk charcoal in a culture solution, phosphoric acid ion and manganese in the solution decreased by about 35% and calcium by about 10% in the duration of 120 minutes, as a result of having been adsorbed into the rice husk charcoal. On the other hand, chloride ion increased by about 80% and potassium and iron by about 30%, because of having been dissolved out from the charcoal. In cultivating spinach, butterhead lettuce and radish in the rice husk charcoal culture media, the culture medium with charcoal smaller than 1 mm resulted in harvest reduced by about 75% in spinach, and about 10% in butterhead lettuce. 15 refs., 13 figs., 11 tabs.

15777 (DOE/AL/99286–T5) **Environmentally conscious manufacturing-technology access project: Technical progress report, April 1, 1994–March 30, 1995.** Maine Metal Products Association, Portland, ME (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG04-94AL99286. Order Number DE95010541. Source: OSTI; NTIS; GPO Dep.

The Environmentally Conscious Manufacturing-Technology Access Project (ECM-TA Project) has developed into a highly respected provider of technical assistance to the metal products industry. It highlighted its first year of operation by receiving the Governor's award for Excellence in Pollution Prevention. The technical assistance program has trained teams of volunteers to conduct on-site ECM assessments and provides additional technical assistance through conferences, seminars, research and access to new technologies. These efforts are achieving the goals of helping these companies to become more competitive and efficient and becoming more environmentally friendly. The nine tasks under this program are described and progress to date on each is discussed. The tasks are: Administration of project; Industry needs opportunities assessment; Develop and maintain Assessment Team and Tech-Source Team; Coordinate ongoing program of basic ECM assessments; Develop and implement trial program of packaged technical assistance; Develop and administer ECM Technology Fund; Facilitate industry attendance at conferences, participation in study tours, and exchange of ideas; Establish ECM Clearinghouse; and Provide worker training in ECM.

15778 (DOE/CE/23810–51B) **Compatibility of refrigerants and lubricants with motor materials under retrofit conditions.** Doerr, R. (Trane Co., La Crosse, WI (United States)); Waite, T. Air-Conditioning and Refrigeration Technology Inst., Inc., Arlington, VA (United States); Trane Co., La Crosse, WI (United States). 12 Jan 1995. 83p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-91CE23810. Order Number DE95010185. Source: OSTI; NTIS; GPO Dep.

Motor materials were exposed to original refrigerants R-11, R-12, R-22 and R-502 in the presence of mineral oil for 500 hours. These same materials were then exposed to alternative refrigerants R-123, R-134a, R-407C (R-32/R-125/R-134a) and R-404A (R-125/R-143a/R-134a), respectively, in the presence of the appropriate lubricant for 500 hours. As a control, some samples were exposed to the original refrigerant/mineral oil for a total of 1,000 hours. These tests were conducted to determine whether exposure to the original refrigerant/mineral oil would affect compatibility of the motor materials with the alternative refrigerant/lubricant after retrofit. Motor materials exposed to the alternative refrigerant and lubricant (after an initial exposure to the original refrigerant and mineral oil) appeared to be compatible with the alternative refrigerant and lubricant. The only concerns were embrittlement of the polyethylene terephthalate (PET) sheet and sleeving insulations, and delamination and blistering of the Nomex sheet insulation in the R-22, R-502, and R-12. Embrittlement of the PET materials was attributed to moisture present during the exposure. Separation of the 475 varnish from metal surfaces in the R-123 was also a concern. The sheet and sleeving insulations were affected by the original refrigerant/mineral oil to a greater extent than by the alternative refrigerant and lubricant.

15779 (DOE/GO–10095-097) **Office of Industrial Technologies: Industry partnerships.** National Renewable Energy Lab., Golden, CO (United States). Apr 1995. 4p. Sponsored by USDOE, Washington, DC (United States). Order Number DE94006881. Source: OSTI; NTIS; GPO Dep.

US industries are making progress in turning the vision of the future into reality: More effective competition in global markets, increased industrial efficiency, more jobs, reduced waste generation and greenhouse gas emissions (to 1990 levels), improved environment. DOE's Office of Industrial Technologies is catalyzing and supporting industry progress in many ways. This pamphlet gives an overview of OIT.

15780 (DOE/PC/91161–T10) **A coal-fired combustion system for industrial process heating applications. Quarterly technical progress report, July 1994–September 1994.** Vortec Corp., Collegeville, PA (United States). Dec 1994. 20p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC22-91PC91161. Order Number DE95010367. Source: OSTI; NTIS; GPO Dep.

PETC has implemented a number of advanced combustion research projects that will lead to the establishment of a broad, commercially acceptable engineering data base for the advancement of coal as the fuel of choice for boilers, furnaces, and process heaters. Vortec Corporation's Phase III development contract DE-AC22-91PC91161 for a "Coal-Fired Combustion System for Industrial Process Heating Applications" is a project funded under the DOE/PETC advanced combustion program. This advanced combustion system research program is for the development of innovative coal-fired process heaters which can be used for high temperature melting, smelting and waste vitrification processes. The process heater systems to be developed have multiple use applications; however, the Phase III research effort is being focused on the development of a process heater system to be used for producing value added vitrified glass products from boiler/incinerator ashes and industrial wastes. The primary objective of the Phase III project is to develop and integrate all the system components, from fuel through total system controls, and then test the complete system in order to evaluate its potential marketability.

15781 (ENEA-RT-INN–94-04) **Activated carbon adsorption for chromium treatment and recovery.** Baroncelli, F. (ENEA, Casaccia (Italy). Area Energia e Innovazione); Castelli, S.; De Francesco, M. ENEA, Casaccia (Italy). Area Energia e Innovazione. May 1994. 17p. (In Italian). (RT/INN–94-04). Order Number DE95771021. Source: OSTI; NTIS (US Sales Only).

The capability of actived carbon systems to adsorb chromium from wastewater of galvanic industry is valued. Batch tests and column tests are carried out with good results. An activated carbon with acidic surface oxides can adsorb both chromate and chromium (III); chromate is reduced in situ and then adsorbed as chromium (III). Chromium can be desorbed from carbon by an acid or basic treatment obtaining respectively chromium (III) or chromate solutions. Carbon can be regenerated many times without evident signs of deterioration.

15782 (ETDE-DE–78) **Accompanying program for the development of small gas generator devices. Final report.** Gerhardt, C. Deutsche Gesellschaft fuer Technische Zusammenarbeit GmbH (GTZ), Eschborn (Germany). 29 Apr 1992. 18p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0326583B. Order Number DE95769269. Source: OSTI; NTIS (US Sales Only).

The aim of the accompanying program was to establish the requirements which can be derived from future conditions of use of small-scale gas generators. The results of this program were used in the main project in order to optimize the product and to adapt it to future conditions of use in developing countries and to reduce thus the risk of failure in field tests and operations. The following aims were attained: 1. Analysis of weak points for existing and

former gas generator systems is carried out. 2. International exchange of experience is brought in. 3. Fields of application, target groups and conditions of the surroundings are defined and delimited. 4. Prerequisites for dissemination measures for small-scale gas generators are defined. (orig.)

15783 (ETDE-DE–85) **Rational use of energy in electrochemical processes especially in the field of electroplating. Final report.** Hartmann, M. Gesellschaft fuer Technische Studien, Entwicklung, Planung mbH (SEP), Muenchen (Germany). Jul 1994. 293p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT 0326945A. Order Number DE95769903. Source: OSTI; NTIS (US Sales Only).

The project was carried out to quantify the energy saving potential in electroplating processes. Emphasis was laid on the investigation of the energy saving potential for the treatment and recycling of process solutions including additional means to eliminate unwanted reaction products. Conventional approved methods for the removal of cyanides consume a high amount of energy and the recycling of highly concentrated process solutions is problematic. For that reason practical tests on that field have been carried out in order to investigate the application potential for electrochemical processes applying both of the following methods: - thermal hydrolysis for the destruction of cyanides, - membrane distillation for the treatment of process solution. Operational tests have been carried out successfully on both methods and the conditions for economic plant operation have been determined. (orig.)

15784 (KCP–613-5539) **Urethane foam process improvements. Final report.** Watson, D.R. Allied-Signal Aerospace Co., Kansas City, MO (United States). Kansas City Div. Mar 1995. 51p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00613. Order Number DE95008957. Source: OSTI; NTIS; GPO Dep.

A study was completed to evaluate the foam molding process for environmental and technical improvements. The investigation led to a replacement for chlorinated solvent usage, a potential permanent mold release coating, improved tooling design, and shrinkage characterization of foams filled with varying levels of aluminum oxide.

15785 (NEI-DK–1878) **Plus-energy agriculture. Phase I.** Tybirk, E. Nordvestjysk Folkecenter for Vedvarende Energi, Hurup (Denmark). Nov 1994. 28p. (In Danish). Contract ENS-UVE-90.0178. Order Number DE95766508. Source: OSTI; NTIS.

The aim was to develop simple techniques in relation to energy-producing, non-pollutive, and yet highly productive family-farming based on a combination of agriculture and aquaculture (dike-ponds). Through maximum use of solar energy, and of all available waste products, an environmentally friendly system is established. This system produces more energy than can be used, in the form of fossil fuels, fodder and other necessaries. The aim of the project was also to document that the system's production of foodstuffs is 4-5 times higher than that resulting from traditional Danish farming methods. The dike-pond system (originating from China) and its construction during the carrying out of the project is described. The overall family-farming system is based on the conversion of manure slurry from 4 large pigs and 1 cubic meter of household sewage daily. It is aimed to produce biomass, protein and clean water from the manures and sewage, to produce energy from methane derived from a biomass conversion plant, plants for fodder and also to supply organic fertilizers from fish excrement. During a period of six months, 20 kg of carp flesh for human consumption can be produced by feeding the fish with pig manure - in addition to water plants providing 20-30% of the necessary pig fodder. (AB) (13 refs.)

15786 (NEI-DK–1895) **Branch analysis of energy for slaughterhouses. Main report.** Koedbranchens Faellesraad, Aarhus (Denmark); Danske Salgterier, Copenhagen (Denmark); Jysk-Fynske Elsamarbejde (ELSAM), Fredericia (Denmark). Distributionsudvalget; Slagteriernes Forskningsinstitut, Roskilde (Denmark); Jysk-Fynske Elsamarbejde (ELSAM), Fredericia (Denmark). Nov 1994. 120p. (In Danish). Order Number DE95766496. Source: OSTI; NTIS.

The aim was to promote energy saving initiatives in slaughterhouses and to develop cheaper methods of energy auditing for the benefit of consultants in this field. The production, process flow and energy consumption are described and areas where it would be possible to reduce energy consumption or recover energy from waste heat are identified. The Danish firms of SYD, IVERSEN-DANE BEEF, TULIP INTERNATIONAL and VESTJYSKE SLAGTERIER's slaughterhouse in Holstebro were chosen for investigation. Recommendations are given with regard to energy surveys of the whole branch and key figures are presented as a basis for comparison with other firms within this branch. Suggestions are given as to where energy consumption could be cut down for example by reducing the amount of surplus condensation heat and installing containers for storage and following reuse of surplus hot water from the production process for cleaning purposes This could save 407 MWh annually. Other suggestions are given as to how to save energy in slaughterhouses. (AB)

15787 (NEI-DK–1896) **Branch analysis of energy for slaughterhouses. Working report. Iversen-Dane Beef. Bylderup Bov department.** Koedbranchens Faellesraad, Aarhus (Denmark); Danske Salgterier, Copenhagen (Denmark); Jysk-Fynske Elsamarbejde (ELSAM), Fredericia (Denmark). Distributionsudvalget; Slagteriernes Forskningsinstitut, Roskilde (Denmark); Jysk-Fynske Elsamarbejde (ELSAM), Fredericia (Denmark). Jan 1995. 54p. (In Danish). Order Number DE95766497. Source: OSTI; NTIS.

A detailed analysis of the Bylderup Bov department of the Danish firm IVERSEN-DANE BEEF. The firm itself, its production and the nature of its energy consumption are described. The technological processes are examined in order to identify possible ways of saving energy, especially with regard to lighting systems, compressed air, ventilation and heating systems. It is reckoned that the slaughterhouse can save 24% of total bought energy consumption, 5% of electricity consumption and 39.7 of natural gas consumption. a summary of this report is found in the main report entitled 'Branch analysis of energy in slaughterhouses'. (AB)

15788 (NEI-DK–1897) **Branch analysis of energy for slaughterhouses. Working report. Tulip International A/S. Minced meat division.** Koedbranchens Faellesraad, Aarhus (Denmark); Danske Salgterier, Copenhagen (Denmark); Jysk-Fynske Elsamarbejde (ELSAM), Fredericia (Denmark). Distributionsudvalget; Slagteriernes Forskningsinstitut, Roskilde (Denmark); Jysk-Fynske Elsamarbejde (ELSAM), Fredericia (Denmark). Nov 1994. 76p. (In Danish). Order Number DE95766498. Source: OSTI; NTIS.

A detailed analysis of the minced meat division of the Danish firm TULIP INTERNATIONAL A/S. The firm itself, its production and the character of its energy consumption are described in addition to the technological processes it employs. General ways only of saving energy mostly in relation to, for example, compressed air, ventilation and heating systems are suggested. It is reckoned that this firm could save 18.6% of bought energy, 6.6% of electricity consumption and 24.8% of natural gas consumption. A summary of this report is found in the main report entitled 'Branch analysis of energy in slaughterhouses'. (AB)

15789 (NEI-DK–1898) **Branch analysis of energy for slaughterhouses. Working report. Slagteri Syd. Blans dept.** Koedbranchens Faellesraad, Aarhus (Denmark); Danske Salgterier, Copenhagen (Denmark); Jysk-Fynske Elsamarbejde (ELSAM), Fredericia (Denmark). Distributionsudvalget; Slagteriernes Forskningsinstitut, Roskilde (Denmark); Jysk-Fynske Elsamarbejde (ELSAM), Fredericia (Denmark). Nov 1994. 85p. (In Danish). Order Number DE95766499. Source: OSTI; NTIS.

A detailed analysis of a slaughterhouse in Blans owned by the Danish firm 'Slagteri SYD' in order to identify possibilities for reducing energy consumption. The firm itself, the nature of its production and energy consumption are described in addition to the technological processes utilized. It is reckoned that the firm could save 16% of total bought energy consumption, 9.8% of electricity consumption and 29% of fuel-oil consumption. A summary of this report is included in the main report entitled 'Branch analysis of energy in slaughterhouses'. (AB)

15790 (NEI-DK–1903) **Branch analysis of energy for the Danish timber industry.** Dk-TEKNIK, Aalborg (Denmark). Energi og Miljoe. Oct 1993. 63p. (In Danish). Order Number DE95766492. Source: OSTI; NTIS.

The results of a branch analysis of energy consumption and potentials for energy conservation within the timber industry are described in detail. 5 firms were examined and it was concluded that savings could be achieved in relation to lighting systems, compressed air, moisturizing of air, suction of varnish and the production and distribution of heat. The investigation is incomplete because certain relevant technologies are as yet undeveloped. (AB)

15791 (NEI-DK–1907) **Branch analysis of energy. Graphic Association Denmark. Main report.** Grafisk Arbejdsgiverforening. Odense (Denmark). Mar 1994. 94p. (In Danish). Order Number DE95766490. Source: OSTI; NTIS.

An analysis of energy consumption within the Danish graphic industry excluding serigraphy and book-binding. It is based on an investigation of energy use in seven graphic firms which are representative for the industry: Aller Press, Fyens Stifttidende, JP-tryk, Kohn Group, Levison + Johnson + Johnson, PLM-Haustrup and Schouw Packing. Case reports are found in a supplementary document of the same title. An aim was to help graphic firms find means of saving energy which it would pay them to carry out and to provide a framework for the process of energy surveying. Energy consumption varies considerably within this branch and depends on the type of product and on the processes used. 40-60% of energy utilized is in the form of electric power and the rest is covered by use of oil, natural gas and district heating. The greatest potentials for saving energy were found to be the reduction of idling in the case of printing machines and connected equipment (saves 40-50% annual energy consumption), more efficient ventilation systems, energy conservation in the case of drying and pressing processes, and also of idleness in this area, and a more efficient use of compressed air and cooling systems as these processes use 20% of total energy consumption and do not currently operate satisfactorily. It is reckoned that the use of electricity could be decreased by 15%, and that in the case of each firm 5-15% of total energy consumption could be saved. (AB)

15792 (NEI-DK–1908) **Branch analysis of energy. Graphic Association Denmark. Supplementary report.** Grafisk Arbejdsgiverforening, Odense (Denmark). Feb 1994. 86p. (In Danish). Order Number DE95766491. Source: OSTI; NTIS.

This supplementary report to the main one of the same title gives detailed information on how to save energy in the cases of individual firms within the Danish graphic industry. (AB)

15793 (NEI-DK–1957) **Energy analysis at Kemira's nitric acid plant. Demonstration of the pinch method.** Weel Hansen, M.; Sandvig Nielsen, J. Dk-TEKNIK, Soeborg (Denmark). Energi og Miljoe. 1991. 80p. (In Danish). Contract ENS-1223/89-2. Order Number DE95772369. Source: OSTI; NTIS.

EFP-89.

The aim was to evaluate the usefulness of the Pinch method (a method of achieving the optimal use of energy) in relation to industrial processes by trying it out at a Danish firm. The principles on which the Pinch method is based are explained and its application in a study of energy efficiency at KEMIRA's nitric acid plant (nr. IV) is described. Here energy economy was investigated, based on the choice of components, energy consumption, and investments in processing facilities. The nitric acid production process and the application of the Pinch method to this process are depicted, and the potential for optimal usage of energy is determined. Suggestions for the design of a completely new plant are given and possibilities for incresing production at the existing plant are debated. It was concluded that the Pinch method was satisfactory in use, its main virtue being that an estimation of realistic energy-efficient goals can be arrived at very speedily. This results in the build-up of further motivation for reaching them. (AB)

15794 (NEI-DK–1979) **Branch analysis of energy for the packing industry.** Ramboell, Hannemann og Hoejlund A/S, Copenhagen (Denmark). Nov 1993. 33p. (In Danish). Order Number DE95772380. Source: OSTI; NTIS.

The aim was to make it possible for firms within the packaging industry to find means of saving 80% of their total energy consumption quickly. The six firms examined were: Henriksen and Blom, Assi Emballage A/S, Danapak Flexible, Konvolutfabrikken Danmark, Joensen/Kruckow-Waldorff I/S and Unibag, Dansk Pose-Industri A/S. These firms are described in detail and areas where energy could be saved are identified. The main recommendations are to regulate operational times and quality of lighting and ventilation systems and compressed air facilities more precisely to actual needs, to mount cut-off valves to compressed air and cooling systems when production machines are closed down, to use suction ventilation directly over processes that pollute indoor air and thus reduce general ventilation needs, to control leakage of compressed air regularly, to reduce machine idleness generally, to keep boilers clean and to upgrade boiler maintenance standards. (AB)

15795 (PNL–9344) **Impact evaluation of a mill tailings thickener installed at J.R. Simplot Company's Smoky Canyon Mine under the Energy $avings Plan.** Brown, D.R.; Spanner, G.E. Pacific Northwest Lab., Richland, WA (United States). Jan 1995. 21p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95007807. Source: OSTI; NTIS; GPO Dep.

This report describes Pacific Northwest Laboratory's (PNL's) evaluation of the impact of an energy conservation project completed in the fall of 1992. The project (a mill tailings thickener) was installed at J.R. Simplot Company's (Simplot's) Smoky Canyon Mine in Caribou County, Idaho near Afton, Wyoming. The project at Simplot is one in a continuing series of industrial energy conservation projects to have its impact evaluated by PNL. All of the projects have received or will receive acquisition payments from the Bonneville Power Administration (Bonneville) under the Energy $avings Plan (E$P) Program. The E$P is being offered to reduce electricity consumption in the industrial sector of Bonneville's service territory. For the Simplot project, the acquisition payment offered under the program was equal to the lesser of 10¢/kilowatt-hour (kWh) saved in the first year or 80% of eligible project costs, up to a limit of $250,000. The general objective of the impact evaluation was to determine how much electricity is saved by the project and at what cost to Bonneville and to the region.

15796 (SAND–94-2565C) **A phenomenological finite element model of part building in the stereolithography process.** Chambers, R.S.; Guess, T.R.; Hinnerichs, T.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9506149–2: 6. international conference on rapid prototyping, Dayton, OH (United States), 4-6 Jun 1995). Order Number DE95008437. Source: OSTI; NTIS; GPO Dep.

The finite element method has been used to develop the framework for a tool that can be used to model the structural deformation arising from the stereolithography build process. Such a tool when fully developed can facilitate numerical studies aimed at evaluating build parameters and build styles. Although the current software makes no attempt to capture all the physics of the process, provisions for three important build features have been made: (1) laser path history including scanning rate and depth of cure, (2) structural linkage, and (3) time varying material behavior. For demonstration purposes, a three dimensional finite element code was modified to include a phenomenological material model of solidification. The model was based on cure shrinkage and stress relaxation data collected from in-situ tests on individual strands drawn using 3D Systems' stereolithography apparatus (SLA-250). To depict the directed path of solidification within layers, a finite element birthing scheme was conceived to activate elements along the predetermined coordinate path of the laser. Structural linkage was enforced by joining element strands of layers when laser paths connect or overlap, respectively. A limited number of analyses have been performed to contrast simple build styles.

15797 (SAND–95-0609C) **Vibration control for precision manufacturing at Sandia National Laboratories.** Hinnerichs, T. (Sandia National Labs., Albuquerque, NM (United States). Structural Dynamics and Vibration Control Dept.); Martinez, D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE

Contract AC04-94AL85000. (CONF-950228–5: North American conference on smart structures and materials, San Diego, CA (United States), 26 Feb - 3 mar 1995). Order Number DE95009582. Source: OSTI; NTIS; INIS; GPO Dep.

Sandia National Laboratories performs R and D in structural dynamics and vibration suppression for precision applications in weapon systems, space, underwater, transportation and civil structures. Over the last decade these efforts have expanded into the areas of active vibration control and "smart" structures and material systems. In addition, Sandia has focused major resources towards technology to support weapon product development and agile manufacturing capability for defense and industrial applications. This paper will briefly describe the structural dynamics modeling and verification process currently in place at Sandia that supports vibration control and some specific applications of these techniques to manufacturing in the areas of lithography, machine tools and flexible robotics.

15798 (WHC-MR–0489) **Glass science tutorial: Lecture No. 4, commercial glass melting and associated air emission issues.** Kruger, A.A. Westinghouse Hanford Co., Richland, WA (United States). Jan 1995. 111p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-87RL10930. Order Number DE95007818. Source: OSTI; NTIS; INIS; GPO Dep.

This document serves as a manual for a workshop on commercial glass melting and associated air emission issues. Areas covered include: An overview of the glass industry; Furnace design and construction practices; Melting furnace operation; Energy input methods and controls; Air legislation and regulations; Soda lime emission mechanisms; and, Post furnace emission controls. Supporting papers are also included.

15799 (CTH-PUBL–93-8, pp. 81-92) **Evacuated powder insulation for district heating applications.** Torstensson, H. (Fjaerrvaermeutveckling FVU AB, Nykoeping (Sweden)); Zinko, H. Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

The use of CFC-containing foam for insulation purposes will be completely stopped within a year or two. Therefore, the use of alternative, environmentally acceptable insulation techniques are of great interest even for district heating applications. In this paper, a new solution based on evacuated fine powder in combination with conventional CFC-free foam is outlined. Of the powder tested, fine-grained kiselguhr and opacified aerogel have been found to show the lowest thermal conductivities, i.e. 0.004 and 0.007 W/(m K) respectively, at a pressure of 1 kPa (0.01 mbar) and a temperature of 75 degrees C. The system design foresees using this powder in the so called CPC - coffee parcel concept, that is; suitably shaped parcels made by diffusion tight plastic laminate foils, filled with powder and then evacuated, are placed in the space between the water pipe and the outer jacket pipe. They are kept in place, bounded and protected by means of polyurethane foam which is expanded into the space between the packages and also applied as a bounding material near the walls of the inner and outer pipes. In this way, a pre-insulated district heating pipe with an effective thermal conductivity of around 0.015 W/(m K) can be achieved. The paper describes technological as well as economical considerations for the CPC technology. 6 refs, 7 figs, 1 tab

15800 (GAO/RCED–94-200) **Energy potential of municipal solid waste is limited.** General Accounting Office, Washington, DC (United States). Resources, Community and Economic Development Div. Sep 1994. 28p. Sponsored by General Accounting Office, Washington, DC (United States). Source: OSTI; U.S. General Accounting Office, P.O. Box 6015, Gaithersburg, MD 20884-6015.

Energy recovery from municipal solid waste has the potential for making only a limited contribution to the nation's overall energy production. Although the current contribution of waste-derived energy production is less than one-half of 1 percent of the nation's total energy Supply, DOE has set a goal for energy from waste at 2 percent of the total supply by 2010. The industry's estimates show a smaller role for waste as an energy source in the future. The energy potential from waste is limited not only by the volume and energy content of the waste itself, but also by the factors affecting the use of waste disposal options, including public opposition and the availability of financing. Energy production from waste combustors and from landfill gases generates pollutants, although these are reduced through current regulations that require the use of emissions control technology and define operational criteria for the facilities. Although DOE estimates that one-third of the energy available from waste is available in the form of energy savings through the recycling of materials, the Department's research in this area is ongoing.

15801 (NEI-DK–1974) **Recycling. Trends in development and integration of recycling in waste management in Europe.** Larsen, I. Miljoestyrelsen, Copenhagen (Denmark). 1994. 32p. (CONF-950184–1: ISWA's international conference on recycling, Taipei (China), 12 Jan 1995). Order Number DE95772373. Source: OSTI; NTIS.

The paper, presented at the International Solid Wastes and Public Cleansing Association's (ISWA) international conference on recycling held on January 12th, 1995 at Taipei, Taiwan R.O.C. discusses trends in the development and integration of recycling in waste management in various European countries. It is claimed that recycling is becoming a more dominant element in the countries' waste policies and strategies. Subjects discussed are problems related to traditional recycling, sorting of household wastes, source sorting and kerb side collection of household wastes, volume reduction and packaging, producer responsibilities, demolition and building wastes, industrial and commercial wastes, general European waste policies and recycling as a form of energy recovery. 3209 Education and Public Relations

15802 (DOE/ER/75758–T1) **Green Street™: A comprehensive urban energy and environmental exhibit and education project. Final report, September 1, 1992–August 31, 1994.** Hamilton, P. Minnesota Science Museum, St. Paul, MN (United States). 31 Aug 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG02-92ER75758. Order Number DE95010169. Source: OSTI; NTIS; GPO Dep.

Goals of the exhibit and education project were to: help audiences see the flows of energy and materials in a city, encourage people to practice energy conservation and environmental improvement steps, provide high school students with environmental science education opportunities, provide people with access to local energy and environmental organizations interested in urban environmental issues, deliver energy and environmental information to audiences that cannot visit the Science Museum of Minnesota, and use the museum as a model to demonstrate energy conservation techniques and alternative energy technology. Green Street publicity in print, TV/radio, etc., are listed.

33 ADVANCED PROPULSION SYSTEMS

3301 Internal Combustion Engines

15803 (DOE/MC/29257–95/C0452) **Allison engine testing CMSX-4® single crystal turbine blades and vanes.** Burkholder, P.S. (Allison Engine Co., Indianapolis, IN (United States)); Thomas, M.C.; Frasier, D.J.; Whetstone, J.R.; Harris, K.; Erickson, G.L.; Sikkenga, S.L.; Eridon, J.M. Allison Engine Co., Indianapolis, IN (United States). [1995]. 16p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC21-93MC29257. (CONF-950463–1: 3. international Charles Parsons turbine conference: materials engineering in turbines and compressors,

Newcastle upon Tyne (United Kingdom), 25-27 Apr 1995). Order Number DE95010308. Source: OSTI; NTIS; GPO Dep.

A team approach utilizing simultaneous engineering has been used to develop CMSX-4 turbine airfoil components. CMSX-4 is a nickel-base single crystal superalloy containing 3% (wt) rhenium and a high 71% volume fraction of coherent γ' precipitate strengthening phase. The high level of balanced properties determined by extensive laboratory evaluation has been confirmed during engine testing the Allison AE 2100 and AE 301X engines, with the post-test condition of the components, including advanced Castcool™ vane segments, being excellent. Also uncooled vane segments in CMSX-4 have exceeded engineering expectations.

15804 (DOE/METC/C–95/7183) **Achieving improved cycle efficiency via pressure gain combustors.** Gemmen, R.S. (US-DOE Morgantown Energy Technology Center, WV (United States)); Janus, M.C.; Richards, G.A.; Norton, T.S.; Rogers, W.A. USDOE Morgantown Energy Technology Center, WV (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). (CONF-950629–2: ASME international gas turbine and aeroengine congress and exposition: land, sea and air, Houston, TX (United States), 5-8 Jun 1995). Order Number DE95008945. Source: OSTI; NTIS; GPO Dep.

As part of the Department of Energy's Advanced Gas Turbine Systems Program, an investigation is being performed to evaluate "pressure gain" combustion systems for gas turbine applications. This paper presents experimental pressure gain and pollutant emission data from such combustion systems. Numerical predictions for certain combustor geometries are also presented. It is reported that for suitable aerovalved pulse combustor geometries studied experimentally, an overall combustor pressure gain of nearly 1 percent can be achieved. It is also shown that for one combustion system operating under typical gas turbine conditions, NO_x and CO emmissions, are about 30 ppmv and 8 ppmv, respectively.

15805 (ETDE-DE–67) **Development of administrative orders for implementation of the Noise Abatement Technical Code: Noise emission from combustion engine test stands.** Rapp, H. (Landesgewerbeanstalt Bayern (LGA), Nuernberg (Germany). Bereich Umweltschutz). Landesgewerbeanstalt Bayern (LGA), Nuernberg (Germany). Bereich Umweltschutz. Jul 1994. 210p. (In German). Sponsored by Umweltbundesamt, Berlin (Germany). Contract UFOPLAN 10503102/23. Order Number DE95768484. Source: OSTI; NTIS (US Sales Only).

The aim of this report is the determination of noise emission from combustion engine test stands. By means of examples there is given a summary of the sound radiation of test stands and their essential components. Methods of noise reduction are compiled and information on construction of a noise-reduced test stand is given. (orig.)

15806 (ETDE-DE–88) **Investigation of the influence of emulsion quality on HC-emission of Diesel engines. Final report.** Binder, K.; Wirbeleit, F.; Raab, A.; Lehner, W. No corporate text available. Oct 1989. 21p. (In German). Sponsored by Bundesministerium fuer Forschung und Technologie, Bonn (Germany). Foerderkennzeichen BMFT TV 8742A; Foerderkennzeichen BMFT TV 850 Order Number DE95770354. Source: OSTI; NTIS (US Sales Only).

By lowering the local temperature in the burning gas and by controlling the local air/fuel ratio by means of water addition to the fuel and injection into the combustion chamber in the form of a diesel/water emulsion, an NO_x decrease as well as reductions in black smoke emissions can be achieved. Since, at least lower loads and speeds this results in an increase in HC emissions, reductions in black smoke emissions do not involve the same effects on particulate emissions. This can be achieved, however, through fuel additive measures providing cetane numbers similar to those of diesel fuel. (orig./HW)

15807 (SAND–95-8222) **Energy storage and alternatives to improve train voltage on a mass transit system.** Gordon, S.P.; Rorke, W.S. Sandia National Labs., Albuquerque, NM (United States). Apr 1995. 66p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. Order Number DE95010344. Source: OSTI; NTIS; GPO Dep.

The wide separation of substations in the Bay Area Rapid Transit system's transbay tunnel contributes to voltage sag when power demand is high. In the future, expansions to the system will exacerbate this problem by increasing traffic density. Typically, this situation is remedied through the installation of additional substations to increase the system's power capacity. We have evaluated the efficacy of several alternatives to this approach - specifically, installation of an 8 megajoule energy storage system, modification of the existing substations, or reduction of the resistance of the running rails or the third rail. To support this analysis, we have developed a simple model of the traction power system in the tunnel. We have concluded that the storage system does not have sufficient capacity to deal with the expected voltage sags; in this application, the alternatives present more effective solutions. We have also investigated the potential impact of these system upgrades on expected future capital outlays by BART for traction power infrastructure additions. We have found that rail or substation upgrades may reduce the need for additional substations. These upgrades may also be effective on other parts of the BART system and on other traction power systems.

3306 Vehicle Design Factors

15808 (ANL/ES/CP–85703) **Field assessment of an aluminum intensive passenger car.** Cuenca, R.M. Argonne National Lab., IL (United States). [1994]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9410256–5: Society of Automotive Engineers' convergence '94, Detroit, MI (United States), 18-27 Oct 1994). Order Number DE95008296. Source: OSTI; NTIS; GPO Dep.

Ford Motor Co. has made a small batch of "aluminum intensive vehicles" (AIV), consisting of mid-size cars (Taurus/Sable) with all-aluminum bodies. The first twenty vehicles were made for internal evaluation at Ford, but the second batch of twenty has been placed on the hands of selected independent users, primarily automotive suppliers, for long term field assessment. The mass reduction achieved in the body of an AIV is shown, and compared with an equivalent standard steel body. Argonne obtained one of these vehicles last October; this is an assessment of the fuel consumption and other operational characteristics of this type of car to date.

15809 (ANL/ES/CP–85704) **Analysis of the potential for new automotive uses of magnesium.** Stodolsky, F.; Gaines, L.; Cuenca, R.; Wu, S. Argonne National Lab., IL (United States). [1994]. 2p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9410309–2: Contractor's coordination meeting, Dearborn, MI (United States), 24-27 Oct 1994). Order Number DE95008297. Source: OSTI; NTIS; GPO Dep.

This paper describes the scope of a new project, just initiated, for the Lightweight Materials Program within the Office of Transportation Materials. The Center for Transportation Research and the Energy Technology Division at Argonne National Laboratory will assess the feasibility and technical potential of using magnesium and its alloys in place of steel or aluminum for automotive structural and sheet applications in order to enable more energy-efficient, lightweight passenger vehicles. The analysis will provide an information base to help guide magnesium research and development in the most promising directions.

3307 Emission Control

15810 (ANL/ET/CP–85237) **Alternative catalyst and exhaust gas sensor work at Argonne National Laboratory.** Iton, L.E.; Maroni, V.A.; Dieckman, S.L.; Sheen, S.H.; Raptis, A.C. Argonne National Lab., IL (United States). [1994]. 9p. Sponsored by

USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-9410256–4: Society of Automotive Engineers' convergence '94, Detroit, MI (United States), 18-27 Oct 1994). Order Number DE95007138. Source: OSTI; NTIS; GPO Dep.

Research programs at Argonne National Laboratory in the areas of automobile emissions monitoring and control are described. The mandate to improve automobile efficiency while reducing Pollution requires the development of new catalysts for exhaust emissions control that are capable of functioning efficiently under lean-burn engine operating conditions. It is also desirable that the use of expensive noble metal catalysts be avoided. NO_x emissions will not be efficiently controlled by the current three-way, supported noble metal catalysts under lean-burn conditions. New catalysts are being sought that could effect the selective catalytic reduction (SCR) of NO_x by exhaust hydrocarbons in the presence of oxygen. Molecular sieve zeolites of the ZSM-5 and ferrierite types, ion-exchanged with copper ions, are the best of the catalysts known to effect this chemistry, but the mechanism of the SCR is still not understood. In this project the authors will first undertake the investigation of the SCR of NO using model reactions to test postulated mechanistic pathways. Initial experiments have been devised to investigate the possible participation of metal alkyl complexes, metal oxime complexes, N-alkyl-N-nitroso-alkylaminato-metal complexes, and metal nitrile complexes in the zeolites. ANL will also develop microsensors, based on surface acoustic wave (SAW) chemical sensing techniques, and a micro mass-spectrometer (MS) for tailpipe or engine-out emission monitoring. The sensor configurations and sensing techniques of the proposed SAW and micro-MS are described.

15811 (KFB–92-265-742) **Exhaust gas catalysts for alcohol vehicles.** Pettersson, L.J. (Royal Inst. of Technology, Dept. of Chemical Engineering and Technology, Stockholm (Sweden)); Jaeraas, S.G. Swedish Transport and Communications Research Board, Stockholm (Sweden). Dec 1994. 62p. Order Number DE95766687. Source: OSTI; NTIS.

The objective for the project is to develop tailor-made exhaust gas catalysts for alcohol-fueled diesel vehicles in city traffic. The aim for the second phase was to increase the knowledge about important phenomena at low temperature oxidation of ethanol and acetaldehyde. Moreover, a basis for the selection and manufacture of a first full-scale catalyst sample for evaluation in engine tests was to be established. Catalytic oxidation of ethanol and acetaldehyde over catalysts applied on monolithic cordierite substrates was studied. Pt, Pd or mixtures were applied onto AlO, CeO2, SiO2, or TiO2 supports. The catalysts were evaluated in a quarts reactor in synthetic exhaust from ethanol-fueled diesel engines. The effect of support material on the low temperature oxidation of ethanol and acetaldehyde in the presence of NO and CO was investigated. The results indicate that the choice of support material influences the product distribution. Both Pt and Pd are active materials for ethanol oxidation, but the selectivity for total oxidation is low at temperatures below 250 deg C. The most important by-product is acetaldehyde, which is formed by oxidative dehydration of ethanol. The differences in acetic acid yields appear to be small between the Pt and Pd catalysts. We have however indications from full-scale tests which show that these differences can be significant for elimination of odor problems. There is clear evidence that acetic acid is not formed via oxidation of acetaldehyde at the experimental conditions. The report includes a literature survey on exhaust gas catalysts for vehicles fueled by ethanol, methanol or natural gas. 74 refs, 27 figs

15813 (NREL/SP–420-5572-Rev.2) **BioFacts: Fueling a stronger economy, Ethanol from biomass. Revision 2.** National Renewable Energy Lab., Golden, CO (United States). Jan 1995. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC36-83CH10093. Order Number DE95010304. Source: OSTI; NTIS; GPO Dep.

Ethanol from biomass is a domestically produced liquid fuel from renewable, virtually inexhaustible domestic resources. It is a non-fossil transportation fuel that contributes little, if any, net carbon dioxide to the atmosphere during production and use. It is a high-octane fuel that can contribute substantially to the US automotive fuel supply. It is a fuel that can be used as a blend, a component of ethyl tertiary butyl ether (ETBE), or as a pure fuel, with excellent efficiency and performance. It is a potentially clean-burning fuel that reduces smog and emissions of carbon monoxide. This overview presents the resource potential, processing techniques, DOE program highlights, utilization potential and environmental effects of ethanol from biomass.

35 ARMS CONTROL

3502 Proliferation

15814 (ANL/ACTV–95/1) **APSTNG: Associated particle sealed-tube neutron generator studies for arms control. Final report on NN-20 Project ST220.** Rhodes, E.; Dickerman, C.E.; Brunner, T.; Hess, A.; Tylinski, S. Argonne National Lab., IL (United States). Dec 1994. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95009651. Source: OSTI; NTIS; GPO Dep.

Argonne National Laboratory has performed research and development on the use of Associated Particle Sealed-Tube Neutron Generator (APSTNG) technology for treaty verification and nonproliferation applications, under funding from the DOE Office of Nonproliferation and National Security. Results indicate that this technology has significant potential for nondestructively detecting elemental compositions inside inspected objects or volumes. The final phase of this project was placement of an order for commercial procurement of an advanced sealed tube, with its high-voltage supply and control systems. Procurement specifications reflected lessons learned during the study. The APSTNG interrogates a volume with a continuous 14-MeV neutron flux. Each neutron is emitted coincident with an "associated" alpha-particle emitted in the opposite direction. Thus detection of an alpha-particle marks the emission of a neutron in a cone opposite to that defined by the alpha detector. Detection of a gamma ray coincident with the alpha indicates that the gamma was emitted from a neutron-induced reaction inside the neutron cone: the gamma spectra can be used to identify fissionable materials and many isotopes having an atomic number larger than that of boron. The differences in gamma-ray and alpha-particle detection times yield a coarse measurement of the distance along the cone axis from the APSTNG emitter to each region containing the identified nuclide. A position-sensitive alpha detector would permit construction of coarse three-dimensional images. The source and emission-detection systems can be located on the same side of the interrogated volume. The neutrons and gamma rays are highly penetrating. A relatively high signal-to-background ratio allows the use of a relatively small neutron source and conventional electronics.

15815 (ORNL/FMP–95/2) **Publications of the Fossil Energy Advanced Research and Technology Development Materials Program: April 1, 1993–March 31, 1995.** Carlson, P.T. (comp.). Oak Ridge National Lab., TN (United States). Apr 1995. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009200. Source: OSTI; NTIS; GPO Dep.

The objective of the Fossil Energy Advanced Research and Technology Development (AR and TD) Materials Program is to conduct research and development on materials for fossil energy applications, with a focus on the longer-term needs for materials with general applicability to the various fossil fuel technologies. The Program includes research aimed at a better understanding of materials behavior in fossil energy environments and on the development of new materials capable of substantial improvement in plant operations and reliability. The scope of the Program addresses materials requirements for all fossil energy systems, including materials for coal preparation, coal liquefaction, coal gasification, heat engines and heat recovery, combustion systems, and fuel cells. Work on the Program is conducted at national and government laboratories, universities, and industrial research facilities. This bibliography covers the period of April 1, 1993, through March 31, 1995, and is a supplement to previous bibliographies in this series. It is the intent of this series of bibliographies to list only those publications that can be conveniently obtained by a researcher through relatively normal channels. The publications listed in this document have been limited to topical reports, open literature publications in refereed journals, full-length papers in published proceedings of conferences, full-length papers in unrefereed journals, and books and book articles. 159 refs.

3601 Metals and Alloys

15816 (ANL/MSD/CP–84769) **On the possibility of a two-state magnetic structure for nanocrystalline chromium.** Fitzsimmons, M.R. (Los Alamos National Lab., NM (United States). Manuel Lujan, Jr. Neutron Scattering Center); Robinson, R.A.; Eastman, J.A.; Lynn, J.W. Argonne National Lab., IL (United States); Los Alamos National Lab., NM (United States). Mar 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38 ; W-7405-ENG-36. (CONF-950201–12: Annual meeting and exhibition of the Minerals, Metals and Materials Society (TMS), Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95009914. Source: OSTI; NTIS; GPO Dep.

Wide-angle neutron diffraction measurements taken at temperatures from 6 to 250 K indicate that the portion of a chromium sample with a mean grain size of 73 nm is antiferromagnetically ordered at temperatures below 100 K. The Neel temperature (about 120 $\pm$ 10 K) for this nanocrystalline sample is suppressed considerably below that of strain-free single-crystal chromium (311 K). Similar measurements of other samples indicate that the amount of antiferromagnetic order decreases with decreasing grain size. The grain size dependence of antiferromagnetic order is discussed in the context of a two-state model.

15817 (CONF-9304146–4) **Anodically enhanced diffusion in Cu/Ag thin film couples.** Jones, D.A. (Univ. of Nevada, Reno, NV (United States). Chemical and Metallurgical Engineering); Jankowski, A.F. Nevada Univ., Reno, NV (United States). [1995]. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FC08-90NV10891. From Alloy 600 experts meeting; Warrenton, VA (United States); 5-9 Apr 1993. Order Number DE95009198. Source: OSTI; NTIS; INIS; GPO Dep.

Thin, 100-nm films of first silver and then copper were deposited consecutively onto pure single-crystal (111) silicon substrates by magneton sputter deposition. Controlled anodic current density was applied at room temperature to dissolve the outer copper film to varying depths approaching the copper/silver interface. Profiles of copper and silver concentration vs. depth below the anodically dissolved surfaces were subsequently obtained by argon ion sputtering and simultaneous Auger Electron Spectroscopy. Despite some intrinsic mixing during the profile analysis, there is clear evidence that diffusion of copper and silver into one another is enhanced by anodic currents at the outer copper surface. Preliminary interpretation leads the authors to believe that the effect is caused by surface formation of vacancies during anodic dissolution. The anodically generated vacancies can migrate as divacancies to the copper/silver interface where they enhance diffusion by the usual vacancy exchange mechanism.

15818 (CONF-941144–108) **Mechanisms of enhanced ionic conduction at interfaces in ceramics.** Lubben, D.; Modine, F.A. Oak Ridge National Lab., TN (United States). Nov 1994. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95009125. Source: OSTI; NTIS; GPO Dep.

A large enhancement in the ionic conductivity of certain compounds occurs when the compound is produced as a composite material containing a finely-dispersed non-conductor such as SiO_2 or Al_2O_3. This paper describes recent experiments which proposes that extended defects such as dislocations and grain boundaries, either resulting from or stabilized by the interface, are responsible for the enhancement. The ionic conductivities of LiI and CaF_2 thin films grown on sapphire(0001) substrates were monitored in-situ during deposition as a function of film thickness and deposition conditions. LiI films grown at 27°C exhibited a region of enhanced conduction within 100 nm of the substrate and a lesser enhancement as the film thickness was increased further. This conduction enhancement was not stable but annealed out with a characteristic log(time) dependence. The observed annealing behavior was fit with a model based on dislocation motion which implies that the increase in conduction near the interface is due to extended defects generated during the growth process. CaF_2 films grown at 200°C showed a behavior similar to the 27°C LiI films, with a region of thermally unstable enhanced conduction that occurs within 10 nm of the substrate. Amorphous Al_2O_3 films deposited over the CaF_2 layers created no additional enhancement but did increase the stability of the conduction, consistent with an extended defect model. Simultaneous deposition of CaF_2 and Al_2O_3 produced films consisting of very-fine-grained CaF_2 and particles of amorphous Al_2O_3 (5-10 nm grain and particle size) and a high defect density which was stable even well above the growth temperature. Measured conduction in the composite at 200°C was approximately 360 times that of bulk CaF_2.

15819 (CONF-941144–109) **Characterization of phosphorus segregation in neutron-irradiated pressure vessel steels by atom probe field ion microscopy.** Miller, M.K.; Jayaram, R.; Russell, K.F. Oak Ridge National Lab., TN (United States). [1995]. 6p. Sponsored by USDOE, Washington, DC (United States);Nuclear Regulatory Commission, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95009129. Source: OSTI; NTIS; INIS; GPO Dep.

An atom probe field ion microscopy characterization of A533B and Russian VVER 440 and 1000 pressure vessel steels has been performed to determine the phosphorus coverage of grain and lath boundaries. Field ion micrographs of grain and lath boundaries have revealed that they are decorated with a semi-continuous film of discrete brightly-imaging precipitates that were identified as molybdenum carbonitride precipitates. In addition, extremely high phosphorus levels were measured at the boundaries. The phosphorus segregation was found to be confined to an extremely narrow region indicative of monolayer-type segregation. The phosphorus coverages determined from the atom probe results of the unirradiated materials were in excellent agreement with predictions

based on McLean's equilibrium model of grain boundary segregation. The boundary phosphorus coverage of a neutron-irradiated weld material was significantly higher than that observed in the unirradiated material.

15820 (CONF-941144–117) **Determination of site-occupancies in aluminide intermetallics by ALCHEMI.** Anderson, I.M. (Oak Ridge National Lab., TN (United States)); Bentley, J.; Duncan, A.J. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States);Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95009179. Source: OSTI; NTIS; GPO Dep.

The site-distributions of Fe in four B2-ordered NiAl-based alloys with Fe concentrations of 10%, 2%, and 0.5% have been determined by ALCHEMI (atom-location by channeling-enhanced microanalysis). Site-distributions have been extracted with standard errors between ~ 1.5% (10% Fe concentration) and ~ 6% (0.5% Fe concentration). The results show that Fe has no strong site-preference in NiAl and tends to reside on the site of the stoichiometrically deficient host element. An improved ALCHEMI analysis procedure is outlined. The analysis explicitly addresses the phenomenon of ionization delocalization, which previously complicated the determination of site-distributions in aluminide intermetallics, leading to inaccurate and oftentimes nonphysical results. The improved ALCHEMI analysis also addresses the presence of anti-site defects. The data acquisition conditions have been optimized to minimize the sources of statistical and systematic error. This optimized procedure should be suitable for all analyses of B2-ordered alloys. Several analyses at different channeling orientations show that the extracted site-occupancies are robust as long as the data are acquired at orientations that are remote from any major pole of the crystal.

15821 (CONF-941144–118) **Residual stress distribution in FeAl weld overlay on steel.** Wang, X.L.; Spooner, S.; Hubbard, C.R.; Maziasz, P.J.; Goodwin, G.M.; Feng, Z.; Zacharia, T. Oak Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95009178. Source: OSTI; NTIS; GPO Dep.

Neutron diffraction was used to measure the residual stress distribution in an FeAl weld overlay on steel. It was found that the residual stresses accumulated during welding were essentially removed by the post-weld heat treatment that was applied to the specimen; most residual stresses in the specimen developed during cooling following the post-weld heat treatment. The experimental data were compared with a plasto-elastic finite element analysis. While some disagreement exists in absolute strain values, there is satisfactory agreement in strain spatial distribution between the experimental data and the finite element analysis.

15822 (CONF-941144–125) **Strength, ductility, and fracture mode of ternary FeAl alloys.** Schneibel, J.H.; George, E.P.; Specht, E.D.; Horton, J.A. Oak Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95010281. Source: OSTI; NTIS; GPO Dep.

The iron aluminides Fe-45Al-5X-0.2B-0.1Zr (at. %), where X stands for the first row transition metals Ti, V, Cr, Mn, Fe, Co, Ni, Cu, were examined at room temperature for strength, ductility, environmental sensitivity, and fracture mode. The extruded materials were annealed at 1273 K to produce similar grain sizes and then at 673 K to reduce the quenched-in vacancies. All alloys were essentially single phase. Their solid-solution strengthening was found to correlate with the atomic size misfit from the lattice parameters. The "binary" alloy Fe-45Al-O.2B-0.1Zr exhibited predominantly transgranular fracture. Ternary alloying additions with atomic numbers less than that of Fe tended to enhance intergranular fracture, whereas those with atomic numbers higher than that of Fe favored substantial amounts of transgranular fracture. Tensile testing in a partial pressure of dry oxygen increased the ductilities of the ternary alloys only slightly, whereas the ductility of the binary alloy increased from about 8 to about 19%. The ductilities in air correlated inversely with the yield strength. However, those alloys exhibiting substantial amounts of transgranular fracture always showed higher ductilities than those fracturing intergranularly. The fracture results are interpreted in terms of yield strengths and ternary element site occupations.

15823 (CONF-950740–18) **Modeling of stress distributions on the microstructural level in Alloy 600.** Kozaczek, K.J. (Oak Ridge National Lab., TN (United States)); Petrovic, B.G.; Ruud, C.O.; McIlree, A.R. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC05-84OR21400. From Joint ASME/JSME pressure vessels and piping conference; Honolulu, HI (United States); 23-27 Jul 1995. Order Number DE95009135. Source: OSTI; NTIS; INIS; GPO Dep.

Stress distribution in a random polycrystalline material (Alloy 600) was studied using a topologically correct microstructural model. Distributions of von Mises and hydrostatic stresses at the grain vertices, which could be important in intergranular stress corrosion cracking, were analyzed as functions of microstructure, grain orientations and loading conditions. Grain size, shape, and orientation had a more pronounced effect on stress distribution than loading conditions. At grain vertices the stress concentration factor was higher for hydrostatic stress (1.7) than for von Mises stress (1.5). The stress/strain distribution in the volume (grain interiors) is a normal distribution and does not depend on the location of the studied material volume i.e., surface vs/bulk. The analysis of stress distribution in the volume showed the von Mises stress concentration of 1.75 and stress concentration of 2.2 for the hydrostatic pressure. The observed stress concentration is high enough to cause localized plastic microdeformation, even when the polycrystalline aggregate is in the macroscopic elastic regime. Modeling of stresses and strains in polycrystalline materials can identify the microstructures (grain size distributions, texture) intrinsically susceptible to stress/strain concentrations and justify the correctness of applied stress state during the stress corrosion cracking tests. Also, it supplies the information necessary to formulate the local failure criteria and interpret of nondestructive stress measurements.

15824 (CONF-950740–19) **Modeling of grain boundary stresses in Alloy 600.** Kozaczek, K.J. (Oak Ridge National Lab., TN (United States)); Sinharoy, A.; Ruud, C.O.; McIlree, A.R. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States);Electric Power Research Inst., Palo Alto, CA (United States). DOE Contract AC05-84OR21400. Contract RP2812-13. From Joint ASME/JSME pressure vessels and piping conference; Honolulu, HI (United States); 23-27 Jul 1995. Order Number DE95009033. Source: OSTI; NTIS; INIS; GPO Dep.

Corrosive environments combined with high stress levels and susceptible microstructures can cause intergranular stress corrosion cracking (IGSCC) of Alloy 600 components on both primary and secondary sides of pressurized water reactors. One factor affecting the IGSCC is intergranular carbide precipitation controlled by heat treatment of Alloy 600. This study is concerned with analysis of elastic stress fields in vicinity of M_7C_3 and $M_{23}C_6$ carbides precipitated in the matrix and at a grain boundary triple point. The local stress concentration which can lead to IGSCC initiation was studied using a two-dimensional finite element model. The intergranular precipitates are more effective stress raisers than the intragranular precipitates. The combination of the elastic property mismatch and the precipitate shape can result in a local stress field substantially different than the macroscopic stress. The maximum local stresses in the vicinity of the intergranular precipitate were almost twice as high as the applied stress.

15825 (DOE/ER–0313/16, pp. 142-145) **Consequences of no postweld heat treatment on the fracture toughness of low activation martensitic steels.** Li, H.; Gelles, D.S.; Jones, R.H. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report*

for the period ending March 31, 1994. 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Fracture toughness has been measured for two conditions of low activation martensitic steel F-82H, the first, a fully tempered condition and the second, completely untempered. In the fully tempered condition, F-82H has a J_{IC} toughness of 284 kJ/m^2 (K_{IC} = 263.8 MPa$\sqrt{m}$), but in the untempered condition, the J_{IC} toughness is 18.4 kJ/m^2 (K_{IC} = 64 MPa$\sqrt{m}$). The consequences of not tempering are discussed in light of these measurements.

15826 (DOE/ER–0313/16, pp. 161-169) **Effect of hydrogen on the fracture toughness of a ferritic/martensitic stainless steel.** Li, H.; Jones, R.H.; Hirth, J.P.; Gelles, D.S. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Effects of hydrogen (H) on the mixed-mode I/III critical J integrals (J_{MC}) and tearing moduli (T_M) were examined for a ferritic/martensitic stainless steel (F-82H) at ambient temperature. A determination of J_{MC} was made using modified compact-tension specimens. Different ratios of tension/shear stress were achieved by varying the principal axis of the crack plane between 0 and 55 degrees from the load line. A specimen with 0 degree crack angle is the same as a standard mode I compact tension specimen. Specimens were heat-treated at 1000°C/20 h/air cooled (AC)-1100°C/7 min/AC-700°C/2 h/AC. The specimens were charged with H at a hydrogen gas pressure of 138 MPa at 300°C for two weeks, which resulted in a H content of 6 ppm(wt), as measured with the "inert gas fusion" technique. J_{MC} and T_M values were determined with the single specimen technique. Crack lengths were calculated by means of partial unloading compliances. The preliminary results from J integral tests showed that introducing H decreased J_{MC} and T_M values as compared to those without H. However, the presence of H did not change the dependence of J_{MC} and T_M values on the crack angles. Both mode I J and T values (J_{IC} and T_i) exhibited the highest values. Both the minimum J_{MC} and T_M values occurred at a crack angle between 35 and 55 degrees, corresponding to the load ratio (σ_{III}/σ_I) of 0.7 to 1.4.

15827 (DOE/ER–0313/16, pp. 225-234) **Fabrication of vanadium alloy product forms for specimens preparation.** Grossbeck, M.L. (Oak Ridge National Lab., TN (United States)); Roche, T.K.; Eatherly, W.S.; Dyer, F.F.; Rouse, N.H. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The alloy V-5Cr-5Ti (Teledyne Wah Chang heat 832394) was received in the form of a 6.35 mm plate and was rolled to 3.81 mm plate and 0.76 mm sheet. The 3.81 mm plate was used for Charpy impact specimens and the 0.76 mm sheet was used for tensile specimens and welding experiments. Since interstitial impurities are important strengthening and embrittling agents in refractory metals, all anneals had to be done in ultra-high vacuum furnaces.

15828 (DOE/ER–0313/16, pp. 235-239) **Welding development for V-Cr-Ti alloys.** Goodwin, G.M. (Oak Ridge National Lab., TN (United States)); King, J.F. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Welds have been produced and characterized using the gas-tungsten arc (GTA) and electron beam (EB) welding processes. Thin sheet (0.75 mm) welds were made with three levels of interstitial contamination, and hardness and tensile properties were found to be strongly affected by oxygen pickup. Thick-section (6 mm) welds have been produced using both processes, and no embrittlement is experienced when high purity atmosphere is maintained. Metallographic examination shows a narrow, but coarse grained, heat affected zone for the GTA welds. Transition joint welding development between vanadium alloy and stainless steel has shown encouraging results.

15829 (DOE/ER–0313/16, pp. 244-257) **The relationship between recrystallization temperature, grain size, and the Charpy impact properties of V-Cr-Ti alloys.** Grossbeck, M.L.; Rowcliffe, A.F.; Alexander, D.J. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

It is shown that the blunt notch Charpy impact properties of a V-5Cr-5Ti alloy are extremely sensitive to the grain size distribution developed during the final annealing treatment. Ductile behavior down to liquid nitrogen temperatures can be induced, for example, by a treatment at 950°C, rather than annealing at 1125°C. It is proposed that the resistance to irradiation-induced shift in DBTT reported by Argonne National Laboratory (ANL) researchers for the V-4Cr-4Ti alloy is related primarily to the exceptionally fine-grained microstructure developed during the low temperature processing route adopted for this alloy.

15830 (DOE/ER–0313/16, pp. 258-259) **Room temperature elastic properties of V-5Cr-5Ti.** Simpson, W.A. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Elastic moduli were measured for a specimen of the alloy V-5Cr-5Ti in the annealed condition using pulse-echo techniques. The value of Young's modulus was determined to be 125.6 GPa, the shear modulus was determined to be 45.9 GPa, and the Poisson's ratio to be 0.367.

15831 (DOE/ER–0313/16, pp. 260-268) **Thermophysical properties of V-5Cr-5Ti.** Porter, W.D. (Oak Ridge National Lab., TN (United States)); Dinwiddie, R.B.; Grossbeck, M.L. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Measurements of thermal expansion of V-5Cr-5Ti have been made from room temperature to 600°C, and specific heat and thermal conductivity have been measured over the range of 100 to 600°C. In each case, the results have been fitted to a polynomial expression to provide a convenient form for design studies.

15832 (DOE/ER–0313/16, pp. 269-271) **Atom probe field ion microscopy characterization of vanadium-titanium-chromium alloys.** Miller, M.K. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The atom probe field ion microscope was used to examine two V-Cr-Ti alloys (V-5Cr-5Ti and V-4Cr-4Ti) which have been shown to have very different fracture properties. The alloys were examined for clustering to detect the presence of small precipitates as well as to determine the distribution of solute elements in the matrix. The elements Ti, Cr, and Si were examined and no clustering of any of these three elements was found.

15833 (DOE/ER–0313/16, pp. 272-278) **Analysis of grain boundaries in a V-5Cr-5Ti alloy using Auger Electron Spectroscopy.** Braski, D.N. (Oak Ridge National Lab., TN (United States)); Grossbeck, M.L. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

A V-5Cr-5Ti specimen was fractured in-situ below its DBTT and the fracture surfaces analyzed by Auger Electron Spectroscopy (AES). About 70% of the fresh fracture surfaces were intergranular while the remainder were characteristic of cleavage fracture. Submicron-sized particles appeared to cover most of the grain boundary surfaces along with a few larger particles. Only one of these larger particles, probably a Ti-V sulfide/phosphide combination, contained Cl, at a level of only a few at.%. On the other hand, S, which is known to cause embrittlement in many alloy systems, was detected on virtually all of the grain boundary surfaces.

15834 (DOE/ER–0313/16, pp. 279-292) **Fracture toughness of V-5Cr-5Ti alloy at room temperature and 100°C.** Li, H.;

Jones, R.H.; Hirth, J.P. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The critical mixed-mode I/III fracture toughness, J-integrals (J_{MC}), at room temperature (RT) and 100°C were examined for a V-5Cr-5Ti alloy. Fracture toughness at 100°C was evaluated with a J-integral test and at RT with a K (the stress intensity factor) test. The determination of J_{MC} was made using modified compact-tension specimens. Different ratios of tension/shear stress were achieved by varying the principal axis of the crack plane between 0 and 45 from the load line. Crack angles used in this study were 0, 15, and 45 degrees. A specimen with 0 degree crack angle is the same as a standard mode I compact tension specimen. In this limit, J_{MC} becomes J_{IC}. Specimens were annealed at 1125°C for 1 hour in a vacuum of 10^{-7} torr. J_{MC} and mixed-mode tearing moduli (T_M) were determined at 100°C with the single specimen technique. Crack lengths were calculated with partial unloading compliances. The J_{MC} values at RT were calculated from critical stress intensity factors (K_C). The results showed that at RT the V-5Cr-5Ti alloy was brittle and experienced unstable crack growth with a mixture of intergranular, cleavage and some microvoid coalescence (MVC) fracture while at 100°C it exhibited high fracture toughness and fractured with a mixture of MVC and intergranular failure. SEM investigation showed that some cleavage facets initiated at grain boundaries. The results suggest a low intergranular fracture strength and tendency towards cleavage fracture at room temperature. Preliminary data from Auger electron microscopy showed significant sulfur segregation on grain boundaries. The possible mechanism which might reduce intergranular fracture strength is discussed.

15835 (DOE/ER–0313/16, pp. 342-350) **Room temperature fatigue behavior of OFHC copper and CuAl25 specimens of two sizes.** Singhal, A.; Stubbins, J.F.; Singh, B.N.; Garner, F.A. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830 ; FG06-89ER75522. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Copper and its alloys are appealing for application in fusion reactor systems for high heat flux components where high thermal conductivities are critical, for instance, in divertor components. The thermal and mechanical loading of such components will be, at least in part, cyclic in nature, thus requiring an understanding of their fatigue behavior. This report describes the room temperature fatigue behavior of unirradiated OFHC (oxygen free high conductivity) copper and CuAl25 (copper strengthened with a 0.25% atom fraction dispersion of alumina). The response of two fatigue specimen sizes to strain controlled fatigue loading is examined, and differences in behavior are discussed. Specimens with the smaller size are now being irradiated in several reactors.

15836 (DOE/PC/92542–T9) **Robotic weld overlay coatings for erosion control. Quarterly technical progress report, October 1994–December 1994.** Levin, B.F.; Dupont, J.N.; Marder, A.R. Lehigh Univ., Bethlehem, PA (United States). Energy Research Center. 25 Jan 1995. 17p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG22-92PC92542. Order Number DE95009643. Source: OSTI; NTIS; GPO Dep.

Research is presently being conducted to develop a criteria for selecting weld overlay coatings for erosion mitigation in Circulated Fluidized Beds. Initially, eleven weld overlay alloys were selected for erosion testing based upon a literature review. All eleven coatings were deposited on 1018 steel substrates using the plasma arc welding process. Ten samples from each coating were prepared for erosion testing. The coating deposition and sample preparation procedures were described in the second quarterly report. All selected coatings were erosion tested at 400°C and their erosion resistance was evaluated by determining the steady state erosion rate. In addition, the microstructure of each coating was characterized before and after the erosion tests. The results of the tests are discussed in the third quarterly report. No correlations were found between room temperature hardness of the weld overlay coatings and their erosion resistance at elevated temperature. During the last quarter tensile tests were performed at 400°C for the Ultimet, Inconel-625, 316L SS, C-22, and Stellite-6 wrought alloys. The erosion tests for these materials at 400°C are in progress. The results of mechanical and erosion tests will be used to correlate mechanical properties of selected wrought alloys such as tensile toughness, ductility, strain hardening coefficient and yield strength to their erosion resistance at 400°C. Also, the erosion behavior of the wrought alloys compared with similar weld alloys will be analyzed. The experimental procedure and results of the tensile tests are presented in this progress report.

15837 (EGG-M–94409) **Heat transfer model of runout table cooling: A fundamental approach.** Hernandez, V.H. (Univ. of British Columbia, Vancouver, British Columbia (Canada). Centre for Metallurgical Process Engineering); Samarasekera, I.V.; Brimacombe, J.K. EG and G Idaho, Inc., Idaho Falls, ID (United States). [1994]. 35p. Sponsored by USDOE, Washington, DC (United States);American Iron and Steel Inst., Washington, DC (United States);Universidad Nacional Autonoma de Mexico, Mexico City (Mexico);International Council for Canadian Studies, Ottawa, ON (Canada). DOE Contract FC07-93ID13205. (CONF-9410290–4: 36. mechanical working and steel processing conference, Baltimore, MD (United States), Oct 1994). Order Number DE95008603. Source: OSTI; NTIS; GPO Dep.

It is well known that the cooling of hot-rolled steel on the runout table is a determining factor to the final properties of the steel produced. Smaller final ferrite grain size, combined with precipitation strengthening, obtained at high cooling rates, allows lower carbon steels to achieve higher mechanical properties and better weldability and toughness. Here, a semi-theoretical model for jet impingement, and parallel flow boiling curves were developed to compute the strip temperature during cooling on the runout table. Comparison of model predictions with pilot-plant and fullscale measurements is satisfactory. Insight into the fundamental evaporation mechanisms is presented. Variables such as water temperature and flow rate, strip temperature and speed are considered.

15838 (HW–32236) **Quarterly progress report - metallurgy unit - April 1954–June 1954.** Cadwell, J.J. General Electric Co., Richland, WA (United States). Hanford Atomic Products Operation. 16 Jul 1954. 94p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95009450. Source: OSTI; NTIS; GPO Dep.

Four irradiated tensile specimens were tested in the Radiometallurgy laboratory. The uranium was from a lot rolled at Simonds Saw and STeel Company, then beta heat treated by the triple dip process. The samples were irradiated to 310 MWD/AT. The corrected exposure was 620 MWD/T after compensating for the decrease in flux depression due to the specimen size. Two of the irradiated specimens were tested in the as-received condition while the other two were vacuum annealed at 400°C for 15 hours prior to testing. When the tensile properties of the unirradiated controls, irradiated, and irradiated-annealed specimens were compared, it was observed that no marked change in modulus of elasticity occurred, the 0.1 percent offset yield strength increased by a factor of about two for the irradiated and irradiated-irradiated, and 35 for the irradiated-annealed specimens, compared to the controls. The marked change in mechanical properties on irradiation as well as the relatively small effect of the anneal, indicates that the foreign atom effect caused by fission product concentration and distribution is the controlling factor, and work-hardening type of damage is relatively insignificant.

15839 (IAE–2152/6) **The applications miniature tensile specimens to determine mechanical properties of irradiated austenitic stainless steel.** Hofman, A. (Institute of Atomic Energy, Otwock-Swierk (Poland)); Kochanski, T.; Malczyk, A. Institute of Atomic Energy, Otwock-Swierk (Poland). Sep 1993. 13p. (In Polish). Order Number DE95628606. Source: OSTI; NTIS; INIS.

The effects of specimen thickness and grain size on the yield strength, ultimate tensile strength and total elongation of austenitic steel OH18N10T have been investigated. Generally the mechanical properties deteriorate with decreasing specimen thickness for a constant grain size. The ratio of specimen thickness (t) to grain size (d) as function of 0.2% yield strength is determined. When the

value of t/d is larger than the critical value, the 0.2% yield strength of miniature specimens become equal to that of the bulk material. (author). 11 refs, 7 figs, 1 tab.

15840 (IAE–2155/6) **Investigation of the properties of aluminium alloys used in the construction of nuclear research reactors.** Hajewska, E. (Institute of Atomic Energy, Otwock-Swierk (Poland)). Institute of Atomic Energy, Otwock-Swierk (Poland). Nov 1993. 48p. Order Number DE95628607. Source: OSTI; NTIS; INIS.

In the paper there are described the results of the studies of the properties of aluminium alloys using in the construction of research reactors, especially of the Polish alloy PAR-1 which belongs to the group of Al-Mg-Si alloys. The influence of the heat treatment on structure of the alloy as well as on the mechanical and corrosion properties was studying. In the paper the results of some properties of PAR-1 alloy after irradiation were done. (author). 27 refs, 43 figs, 9 tabs.

15841 (IEA–2143/6) **The evolution of microstructure of austenitic stainless steels OH18N10T and OOH17N14M2 irradiated with high energy ions.** Hofman, A. (Institute of Atomic Energy, Otwock-Swierk (Poland)); Kochanski, T.; Krasnowski, M. Institute of Atomic Energy, Otwock-Swierk (Poland). Feb 1993. 18p. (In Polish). Order Number DE95628608. Source: OSTI; NTIS; INIS.

The microstructural evolution in austenitic stainless steels irradiated with heavy-ions to a dose of <5 dpa at temperature <100 C has been investigated. The transmission electron microscopy has been used to characterize the microstructural changes and the dependence of density the radiation defects on the dose of irradiation. The data obtained in the experiment were compared with results after neutron irradiation ($E > 0.1$ MeV). (author). 21 refs, 13 figs, 3 tabs.

15842 (INIS-JP–028, pp. 63-65) **Surface functionalization by molten salt electrolytic processes.** Ito, Yasuhiko (Kyoto Univ. (Japan). Faculty of Engineering); Tada, Masayuki; Kawase, Makoto; Goto, Takuya; Asamura, Hiroki. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

The attention has been paid to surface functionalization by molten salt electrolytic processes. Three topics on the experimental results obtained by the authors are described: the electrochemical formation of zirconium metal film and zirconium alloy film on ceramic, surface nitriding of titanium by electrochemical process and an anodic oxide film formation on nickel. (author).

15843 (INIS-JP–028, pp. 88-90) **Basic study on the secondary hydride in zircaloy cladding by the nuclear reaction D(^{3}He,p)^{4}He and thermal desorption.** Hashizumi, Masatsugu (Kyoto Univ. (Japan). Faculty of Engineering); Hattori, Takayuki; Fujita, Haruyuki; Takagi, Ikuji; Higashi, Kunio. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Depth profiles of deuterium in zirconium claddings were observed using the nuclear reaction D(^{3}He,p)^{4}He. The deuterium concentrations depended on the cooling rate just after the cladding absorbed deuterium at an elevated temperature. The thermal desorption spectroscopy (TDS) was also conducted. Most deuterium were desorbed at the temperature of 973K. It was found that the deuterium concentrations in the cladding could be known from the TDS measurement. (author).

15844 (INIS-JP–029, pp. 54-56) **Application of plasma driven permeation to the study on deuterium diffusion and trapping in metals.** Tanaka, Toshiyuki (Kyoto Univ. (Japan). Faculty of Engineering); Takagi, Ikuji; Fujita, Haruyuki; Shin, Kazuo; Higashi, Kunio. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Deuterium diffusion and permeation in metals were experimentally studied in the plasma driven permeation. The large permeation flux allowed us to determine the diffusion coefficients of deuterium in metals with the time-lag method. The trapping energy in an iron sample was obtained from the apparent diffusion coefficients. The traps were annihilated at elevated temperatures. (author).

15845 (IS-T–1703) **A study of Damascus steel.** Berge, P. Ames Lab., IA (United States). 16 Feb 1995. 77p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE95010127. Source: OSTI; NTIS; GPO Dep.

The Damascus sword has been an article of fascination for many years to blade collectors and metallurgists alike. The blades were given their name by Europeans who encountered these blades which originated from Damascus, Syria. They are best known for the appearance of the blade face. Genuine Damascus blades show swirling patterns of alternating light and dark regions which are due to the microstructure of the steel. The microstructure consists of arrays of well rounded cementite patterns in a matrix of either pearlite, bainite, or martensite. When this structure is etched the matrix will turn dark leaving the cementite particles light. Although many blades were produced over the centuries, while some of the process is known the making of a genuine Damascus blade today is generally considered a lost art. Many scientists have studied the subject in an attempt to understand the complex process by which the clustered arrays of cementite particles develop in the steel blades. The most prominent theories to date are presented in the General Introduction to this thesis. The thesis is divided into four main parts. In the first part, four proposed mechanisms of cementite cluster sheet formation as they relate to the banding theory are introduced. Experiments to investigate these mechanisms are presented. In Part II, collaborative research focused on the methodology of the reconstructed process for making Damascus steel is presented. In the third part, a study into the graphitization of the reconstructed blades is presented. In Part IV, experimental attempts at producing Damascus steel ingots in the laboratory are presented.

15846 (IS-T–1718) **Dissolution of eutectic microstructures.** Nordlund, C. Ames Lab., IA (United States). 10 Feb 1995. 74p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE95010244. Source: OSTI; NTIS; GPO Dep.

Literature review of microstructural development during melting revealed comprehensive work on interface stability but only observations of two-phase melting, including eutectic systems, with no analytical work. Four analytical models were developed to establish the role of solute diffusion and surface energy on morphology of a directionally melted lamellar eutectic. First, a mass balance of solute provided solute profile equations for the cases of no diffusion and complete diffusion in the liquid. Second, an energy balance at the interface provided separate equations for the average mp of each phase vs velocity, lamellar spacing, and material constants. Third, the diffusion equation was solved for a planar melting interface (solving for the average temperature of interface and combining with solute profile allowed solution of interface shape). Finally, a balance of the normal solute flux at the interface was used to examine the relation between interface morphology and solute diffusion in the liquid and solid. Experiments were conducted using a transparent organic lamellar eutectic alloy in which the melting interface could be observed in-situ. Steady-state interface morphologies were compared with predictions of solution of diffusion equation. Most experiments fitted the predicted morphologies, with exceptions where diffusive coupling was not maintained and a nonisothermal, nonplanar interface resulted. Experiment also revealed interface instabilities, including brief periods of a single phase planar interface and a Rayleighian instability for the nonplanar morphologies.

15885 (LA-UR–95-619) **Ductile damage model with void coalescence.** Tonks, D.L. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States);Department of Defense, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9507100–2: Plasticity and its current applications symposium, Osaka (Japan), 17-21 Jul 1995). Order Number DE95007855. Source: OSTI; NTIS; GPO Dep.

A general model for ductile damage in metals is presented. It includes damage induced by shear stress as well as damage caused by volumetric tension. Spallation is included as a special case. Strain induced damage is also treated. Void nucleation and growth are included and give rise to strain rate effects. Strain rate effects also arise in the model through elastic release wave propagation between damage centers. Underlying physics of the model is the nucleation, growth, and coalescence of voids in a plastically flowing solid. Implementation of the model in hydrocodes is discussed.

15886 (LA-UR–95-626) **Numerical analysis of the ultraprecision machining of copper.** Stevens, R. (Los Alamos National Lab., NM (United States)); Anderson, C.; Rhorer, R.; Lucca, D. (CONF-9505203–1: 8. annual IPES meeting, Compiegne (France), 6-12 May 1995). Order Number DE95007857. Source: OSTI; NTIS; GPO Dep.

Modeling of the ultraprecision machining process can aid in the understanding of the relative importance of various process parameters and ultimately lead to improved methods of generating ultraprecision surfaces such as those required for metal optics and single crystal microelectronics substrates. Any modeling method should be verified by direct comparison to experimental data. Until recently it has been difficult to accurately measure the cutting edge, or sharpness, of a diamond tool; and therefore, most models have assumed an infinitely sharp cutting tip. With the relatively new technology of the Atomic Force Microscope (AFM), the cutting edge of single crystal diamond tools can be quantitatively described. Ultraprecision machining experiments using an AFM characterized cutting tool and orthogonal geometry have been performed. These experiments have resulted in measured cutting and thrust forces for different depths of cut in copper (Te-Cu: 99.4-99.5% Cu, 0.5-0.6% Te, 4-5 micron grain size, 225 MPa yield strength) with a well characterized diamond tool. By using this actual tool tip geometry the authors have been able to develop a model that can predict cutting and thrust forces for depths of cut on the order of the sharpness of the tool. Forces predicted by this numerical model are compared to the experimentally measured forces.

15887 (LA-UR–95-784) **Numerical implementation of a state variable model for friction.** Korzekwa, D.A. (Los Alamos National Lab., NM (United States)); Boyce, D.E. Los Alamos National Lab., NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9506144–1: 5. international conference on numerical methods in industrial forming processes (NUMIFORM), Ithaca, NY (United States), 18-21 Jun 1995). Order Number DE95007844. Source: OSTI; NTIS; GPO Dep.

A general state variable model for friction has been incorporated into a finite element code for viscoplasticity. A contact area evolution model is used in a finite element model of a sheet forming friction test. The results show that a state variable model can be used to capture complex friction behavior in metal forming simulations. It is proposed that simulations can play an important role in the analysis of friction experiments and the development of friction models.

15888 (LA-UR–95-918) **Influence of strain rate and temperature on the mechanical behavior of iron aluminide-based alloys.** Gray, G.T. Los Alamos National Lab., NM (United States). [1995]. 5p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9507100–1: Plasticity and its current applications symposium, Osaka (Japan), 17-21 Jul 1995). Order Number DE95009426. Source: OSTI; NTIS; GPO Dep.

Iron aluminides are receiving increasing attention as potential high temperature structural materials due to their excellent oxidation and sulfidation resistance. Although the influence of strain rate on the microstructure/property relationships of pure iron and a variety of iron alloys and steels has been extensively studied, the effect of strain rate on the stress-strain and deformation response

of iron aluminides remains poorly understood. In this paper the influence of strain rate, varied between 0.001 and 10^4 s^{-1}, and temperature, between 77 & 1073°K, on the mechanical behavior of Fe-40Al-0.1B and Fe-16.12Al-5.44Cr-0.11Zr-0.13C-1.07Mo-006Y, called FAP-Y, (both in at.%) is presented. The rate sensitivity and work hardening of Fe-40Al and the disordered alloy based on Fe-16% Al are discussed as a function of strain rate and temperature.

15889 (LA-UR–95-1130) **Open architecture CNC system.** Tal, J. (Galil Motion Control Inc., Sunnyvale, CA (United States)); Lopez, A.; Edwards, J.M. Los Alamos National Lab., NM (United States). [1995]. 12p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-9506169–1: 24. annual symposium on incremental motion control systems and devices, San Jose, CA (United States), 7 Jun 1995). Order Number DE95009485. Source: OSTI; NTIS; GPO Dep.

In this paper, an alternative solution to the traditional CNC machine tool controller has been introduced. Software and hardware modules have been described and their incorporation in a CNC control system has been outlined. This type of CNC machine tool controller demonstrates that technology is accessible and can be readily implemented into an open architecture machine tool controller. Benefit to the user is greater controller flexibility, while being economically achievable. PC based, motion as well as non-motion features will provide flexibility through a Windows environment. Upgrading this type of controller system through software revisions will keep the machine tool in a competitive state with minimal effort. Software and hardware modules are mass produced permitting competitive procurement and incorporation. Open architecture CNC systems provide diagnostics thus enhancing maintainability, and machine tool up-time. A major concern of traditional CNC systems has been operator training time. Training time can be greatly minimized by making use of Windows environment features.

15890 (PNL-SA–25506) **Irradiation-assisted stress corrosion cracking considerations at temperatures below 288°C.** Simonen, E.P.; Jones, R.H.; Bruemmer, S.M. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950304–14: Corrosion '95: National Association of Corrosion Engineers (NACE) international annual conference and corrosion show, Orlando, FL (United States), 26-31 Mar 1995). Order Number DE95008940. Source: OSTI; NTIS; INIS; GPO Dep.

Irradiation-assisted stress corrosion cracking (IASCC) occurs above a critical neutron fluence in light-water reactor (LWR) water environments at 288 C, but very little information exists to indicate susceptibility as temperatures are reduced. Potential low-temperature behavior is assessed based on the temperature dependencies of intergranular (IG) SCC in the absence of irradiation, radiation-induced segregation (RIS) at grain boundaries and micromechanical deformation mechanisms. IGSCC of sensitized SS in the absence of irradiation exhibits high growth rates at temperatures down to 200 C under conditions of anodic dissolution control, while analysis of hydrogen-induced cracking suggests a peak crack growth rate near 100 C. Hence from environmental considerations, IASCC susceptibility appears to remain likely as water temperatures are decreased. Irradiation experiments and model predictions indicate that RIS also persists to low temperatures. Chromium depletion may be significant at temperatures below 100C for irradiation doses greater than 10 displacements per atom (dpa). Macromechanical effects of irradiation on strength and ductility are not strongly dependent on temperature below 288 C. However, temperature does significantly affect radiation effects on SS microstructure and micromechanical deformation mechanisms. The critical conditions for material susceptibility to IASCC at low temperatures may be controlled by radiation-induced grain boundary microchemistry, strain localization due to irradiation microstructure and irradiation creep processes. 39 refs.

15891 (PNL-SA–26013) **Interfacial segregation and deformation of superplastically deformed Al-Mg-Mn alloys.** Vetrano, J.S.; Lavender, C.A.; Bruemmer, S.M. Pacific Northwest Lab., Richland, WA (United States). Mar 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. (CONF-950201–13: Annual meeting and exhibition of the Minerals, Metals and Materials Society (TMS), Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95009572. Source: OSTI; NTIS; GPO Dep.

Microstructural and microchemical studies have been carried out on superplastically deformed Al-Mg-Mn (AA5083-type) alloys. Grain boundary composition was measured using a Scanning Auger Microprobe (SAM) and an Analytical Transmission Electron Microscope (ATEM), while conventional TEM was used for microstructural evaluation. Non-equilibrium segregation of Si to grain boundaries following deformation was measured by both techniques. Significant interfacial Si enrichment was only detected in gage sections of tensile specimens after uniaxial strains from 50 to 200%. Grip regions which experience identical thermal histories, but without plastic deformation, did not reveal Si segregation. Selected samples also showed a slight depletion of Mg at grain boundaries after deformation. The only reproducible observation of equilibrium segregation was in Zr-modified alloys, where Sn was detected by SAM in both the deformed and undeformed sections of the sample. Microstructural analysis documented subgrain formation and subgrain-precipitate interactions during superplastic deformation. In addition, many grain boundaries and precipitate interfaces contained small (5 to 20 nm) voids. Compositional analysis of these nano-voids revealed that they were enriched in Mg with the adjacent boundary regions correspondingly depleted.

15892 (SAND–95-0284C) **The role of dynamic experimentation for computation analysis.** Chhabildas, L.C.; Trucano, T.G. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950788–3: International conference on computational engineering science, Mauna Lani, HI (United States), 30 Jul - 3 aug 1995). Order Number DE95007733. Source: OSTI; NTIS; GPO Dep.

In this paper a brief description of dynamic techniques commonly available for determining material property studies is presented. For many impact applications, the material generally experiences a complex loading path. In most cases, the initial loading conditions can be represented by the shock commonly referred to as the Hugoniot state. Subsequent loading or release structure, i.e., off-Hugoniot states would however be dependent on the physical processes dominating the material behavior. The credibility of the material model is tested by the accuracy of predictions of off-Hugoniot states. Experimental techniques commonly used to determine off-Hugoniot states are discussed in this survey.

15893 (SAND–95-0380C) **Development of a precision wire feeder for small-diameter wire.** Brandon, E.D. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503113–1: Automotive laser applications workshop, Dearborn, MI (United States), 6-7 Mar 1995). Order Number DE95008541. Source: OSTI; NTIS; GPO Dep.

At Sandia National Laboratories in Albuquerque, the author designed and fabricated a precision wire feeder to be used with high energy density (electron beam and laser beam) welding for weld joints where filler wire might be needed to fill a gap or to adjust the chemical composition so that a crack-free weld could be made. The wire feeder incorporates a 25,000 step-per-revolution motor to power a urethane-coated drive roll. A microprocessor-based controller provides precise control of the motor and allows both continuous and pulsed feeding of the wire. A unidirectional 0.75-in.-dia ball bearing is used to press the wire against the drive roll. A slight constant backward tension is maintained on the wire spool by a Bodine torque motor. A Teflon tube is used to guide the wire from the drive roll to the vicinity of the weld, where a hypodermic needle is used to aim the wire into the weld pool. The operation of the wire feeder was demonstrated by feeding a 10-mil-dia, Type 304 stainless steel wire into a variety of CO_2 laser beam welds. The resulting welds are smooth and continuous, and the welds are considered to be completely satisfactory for a variety of applications.

15894 (SKB-TR–94-12) **Research on corrosion aspects of the advanced cold process canister.** Blackwood, D.J. (AEA Technology, Harwell Laboratory, Didcot, Oxfordshire (United Kingdom)); Hoch, A.R.; Naish, C.C.; Rance, A. Swedish Nuclear Fuel

and Waste Management Co., Stockholm (Sweden). Jan 1994. 84p. Order Number DE95626416. Source: OSTI; NTIS; INIS.

The Advanced Cold Process Canister (ACPC) is a waste canister being developed jointly by SKB and TVO for the disposal of spent nuclear fuel. It comprises an outer copper canister, with a carbon steel canister inside. A concern regarding the use of the ACPC is that, in the unlikely event that the outer copper canister is penetrated, the anaerobic corrosion of the carbon steel container may result in the formation of hydrogen gas bubbles. These bubbles could disrupt the backfill, and thus increase water flow through the near field and the flux of radionuclides to the host geology. A number of factors that influence the rate at which hydrogen evolves as a result of the anaerobic corrosion of carbon steel in artificial granitic groundwaters have been investigated. A previously observed, time-dependent decline in the hydrogen evolution rate has been confirmed as being due to the production of magnetite film. Once the magnetite film is about 0.7-1.0 μm thick, the rate of hydrogen evolution reaches a steady state value. The pH and the ionic strength of the groundwater were both found to influence the long-term hydrogen evolution rate. The results of the experimental programme were used to update a model of the corrosion behaviour and hydrogen production from the Advanced Cold Process Canister. 36 figs, 5 tabs, 13 refs.

15895 (SKB-TR–94-13) **Assessment study of the stresses induced by corrosion in the Advanced Cold Process Canister.** Hoch, A.R. (Chemical Studies Department, Radwaste Disposal Division, AEA Decommissioning and Radwaste, Harwell Laboratory, Oxfordshire (United Kingdom)); Sharland, S.M. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Oct 1993. 28p. Order Number DE95626417. Source: OSTI; NTIS; INIS.

The Advanced Cold Process Canister (ACPC) is a concept for the encapsulation of spent nuclear fuel for geological disposal. The basic design of the ACPC consists of an outer oxygen free copper overpack covering a carbon steel inner container. In this report the stresses exerted on the copper overpack as a result of an early failure of the canister and the subsequent corrosion of the steel are calculated. 4 figs, 8 refs, 2 tabs.

15896 (STUDSVIK-M–94-117) **Coolant compatibility studies. The effect of irradiation on stress corrosion cracking sensitivity of a martensitic steel type 1.4914 MANET 4-complementary studies. Part 2.** Nystrand, A.C. Studsvik Material AB, Nykoeping (Sweden). 1994. 16p. Order Number DE95626429. Source: OSTI; NTIS; INIS.

Prior stress corrosion cracking tests of a high-chromium martensitic steel of type 1.4914, referred to as MANET, did not show any irradiation assisted stress corrosion cracking (IASCC). Three-point bend specimens stressed to 95% of the yield strength were used. They were manufactured from coupons previously exposed in a high pressure water loop in the Studsvik R2 reactor. Complementary stress corrosion testing of two irradiated notched three-point bend specimens has been performed. Higher stresses compared to previous experiments were used. However, the specimens have not revealed any signs of IASCC. 5 refs, 4 figs, 4 tabs.

15897 (SVF–529) **Investigation of mechanical properties in a rotor blank of an improved 10% chromium steel manufactured through the PM/HIP process.** Faellman, S. (ABB Stal, Finspaang (Sweden)); Kastensson, P. Stiftelsen foer Vaermeteknisk Forskning, Stockholm (Sweden). Feb 1995. 27p. Project Vaermeforsk-M1-104. Order Number DE95766637. Source: OSTI; NTIS.

A simulated rotor blank of an improved 10% Cr steel with dimension 500 x 700 mm, corresponding to normal rotor diameter of VAX HP turbines, has been manufactured through the PM/HIP process. The aim of the project was to investigate mechanical properties of a rotor with the same dimension as a typical forged HP rotor, determine the homogeneity of the rotor and compare the mechanical properties with conventional 12% Cr steel and previously tested HIP'ed 10% Cr steel. Mechanical properties as tensile, impact, fatigue, fracture toughness, creep and ageing response have been investigated in different locations and directions of the rotor. The results show only small variations in different parts of the rotor indicating a homogeneous material. Tensile, toughness and fatigue properties are all in accordance with previously tested PM/HIP and forged 10% Cr steel and creep properties are improved compared to conventional 12% Cr steel. A slight tendency of notch sensitivity can though be seen in the HIP'ed rotor and also a more pronounced ageing response compared to conventional 12% Cr steel.

15898 (UCRL-JC–119681) **Creep of a fine-grained, fully-lamellar, two-phase TiAl alloy at 760°C.** Wang, J.N. (Lawrence Livermore National Lab., CA (United States)); Schwartz, A.J.; Nieh, T.G.; Liu, C.T.; Sikka, V.K.; Clemens, D. Lawrence Livermore National Lab., CA (United States); Martin Marietta Energy Systems, Inc., Oak Ridge, TN (United States). Feb 1995. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48 ; AC05-84OR21400. (CONF-950201–11: Annual meeting and exhibition of the Minerals, Metals and Materials Society (TMS), Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95009531. Source: OSTI; NTIS; GPO Dep.

Creep of a TiAl alloy, having a composition of Ti-47Al-2Cr-2Nb (in atom %) and a fine-grained, fully-lamellar structure, was carried out at 760 C and stresses between 69–723 MPa. It was found that, in addition to having good room temperature properties, the alloy exhibits higher creep resistance than other TiAl alloys with a similar composition. Both the creep data and microstructures of the alloy suggest that there exists a change in deformation mechanism from a glide-controlled process at high stresses to a recovery-controlled process at low stresses. Also, microstructural evidence indicates that the rate-controlling recovery mechanism is the climb of dislocation segments pinned by ledges at γ/α_2 interfacial boundaries.

15899 (UCRL-JC–119682) **Synthesis and characterization of nanophase face-centered-cubic titanium.** Jankowski, A.F.; Wall, M.A. Lawrence Livermore National Lab., CA (United States). Feb 1995. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950201–10: Annual meeting and exhibition of the Minerals, Metals and Materials Society (TMS), Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95009533. Source: OSTI; NTIS; GPO Dep.

Unalloyed Ti is sputter deposited in the formation of two trilayer films. Each layer within the combinations of Ni-Ti-Ni and Ti-Ni-Ti is less than 0.1 μm thick. High resolution imaging and electron diffraction results are presented for the microstructural characterization of both trilayer films. Nanophase fcc Ti is initially found in crystalline layers grown on Ni whereas hcp Ti is found in layers grown without a Ni epilayer. Conditions are further examined under which the fcc to hcp transition occurs for Ti deposited on Ni.

15900 (VTT-TIED–1550) **Joining dissimilar stainless steels for pressure vessel components.** Zheng Sun (VTT Manufacturing Technology, Espoo (Finland). Production Engineering); Huai-Yue Han. Technical Research Centre of Finland, Espoo (Finland). 1994. 30p. Order Number DE95628594. Source: OSTI; NTIS; INIS.

A series of studies was carried out to examine the weldability and properties of dissimilar steel joints between martensitic and austenitic stainless steels - F6NM (OCrl3Ni4Mo) and AISI 347, respectively. The weldability tests included weld thermal simulation of the martensitic steel for investigating the influence of weld thermal cycles and post-weld heat treatment (PWHT) on the mechanical properties of the heat-affected zone (HAZ); implant testing for examining the tendency for cold cracking of martensitic steel; rigid restraint testing for determining hot crack susceptibility of the multi-pass dissimilar steel joints. The joints were subjected to various mechanical tests including a tensile test, bending test and impact test at various temperatures, as well as slow strain-rate test for examining the stress corrosion cracking tendency in the simulated environment of a primary circuit of a PWR. Based on the weldability tests, a welding procedure - tungsten inert gas (TIG) welding for root passes with HNiCrMo-2B wire followed by manual metal arc (MMA) welding using coated electrode ENiCrFe-3B - was developed and a PWHT at 600 deg C/2h was recommended. Furthermore, the welding of tube/tube joints between these dissimilar steels is described. (21 refs., 11 figs., 14 tabs.).

15901 (WSRC-MS–94-0463) **Analytical modeling of the effect of crack depth, specimen size, and biaxial stress on the fracture toughness of reactor vessel steels.** Chao, Yuh-Jin (Univ. of South Carolina, Columbia, SC (United States). Dept. of

Mechanical Engineering); Lam, Poh-Sang. Westinghouse Savannah River Co., Aiken, SC (United States). [1995]. 19p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC09-89SR18035. (CONF-950740–5: Joint ASME/JSME pressure vessels and piping conference, Honolulu, HI (United States), 23-27 Jul 1995). Order Number DE95005886. Source: OSTI; NTIS; INIS; GPO Dep.

Fracture, toughness values for A533-B reactor pressure vessel (RPV) steel obtained from test programs at Oak Ridge National Laboratory (ORNL) and University of Kansas (KU) are interpreted using the J-A_2 analytical model. The analytical model is based on the critical stress concept and takes into consideration the constraint effect using the second parameter A_2 in addition to the generally accepted first parameter J which represents the loading level. It is demonstrated that with the constraint level included in the model effects of crack depth (shallow vs deep), specimen size (small vs. large), and loading type (uniaxial vs biaxial) on the fracture toughness from the test programs can be interpreted and predicted.

15902 (Y–2467-3) **Y-12 development organization technical progress report: Part 3 - metal processing, period ending September 1, 1994.** Northcutt, W.G. Jr. Oak Ridge National Lab., TN (United States). 8 Feb 1995. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009061. Source: OSTI; NTIS; GPO Dep.

The authors melted and cast an aluminum-uranium (Al-U) alloy by vacuum induction melting (VIM) prealloyed buttons made by arc melting. The resulting alloy casting displayed a large compositional gradient from top to bottom. The authors sampled the resulting casting for uranium to check homogeneity. The sampling revealed that the top of the casting contained 23.5 wt% uranium, and the bottom (an average of two samples) contained 42.4 wt% uranium. Although each button contained 36.5% uranium, these analyses show that the solidified casting was inhomogeneous. If the buttons were homogeneous, the segregation occurred during induction melting, and this method may not be feasible for making AL-U alloys. If the buttons were not homogeneous, perhaps arc melting the buttons more times would have helped. Bottom pouring the Al-U melt into a mold for faster cooling could also help prevent segregation.

15903 (Y/DV–1359) **A performance evaluation of coating systems for long term aqueous immersion service.** Pawel, S.J. Oak Ridge National Lab., TN (United States). 8 Nov 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OS21400. Order Number DE95009060. Source: OSTI; NTIS; GPO Dep.

The static immersion of coated steel panels in various media representative of chemical and waste processes around the Oak Ridge Y-12 Plant was terminated after 16 months exposure for evaluation of coating performance and comparison with observations collected following 1, 6, and 11 months exposure. In each environment, a wide range of coating performance was observed, including some coatings unsuitable for use in the test environment (despite the high recommendation of the vendor). Further, coating performance as a function of time suggests a test duration of at least several months is required to fully assess candidate coating performance for specific applications. The performance of many coatings, particularly in the most alkaline environment, was adversely affected by the imposition of supplemental cathodic protection on the coated test panels.

Conventional chemical etching often presents difficulties in revealing the microstructure of some materials. Ion bombardment etching has helped in overcoming these difficulties in the metallographic preparation of nuclear ceramic materials. Metallographic examination has played a key role in supporting the nuclear fuel development and fabrication programme in the Radiometallurgy Division. A representative selection of photomicrographs obtained by ion-bombardment etching is presented in this report. (author). 2 refs., 1 tab., 20 figs.

15905 (CONF-9407153–Vol.1, pp. 206-238) **Two-powder processing of Bi-2223 - an update.** Dorris, S.E. (Argonne National Lab., IL (United States)); Pitz, M.A.; Dawley, J.; Lanagan, M.T.; Vasanthamohan, N.; Maroni, V.A.; Luo, J.S. USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The patented two-powder process of ANL reproducibly yields more uniform and complete formation of Bi-2223 than does the typical mixed-phase powder process. In the two-powder process, intermediate precursors of lead-doped 2212 and $CaCuO_2$ (which decomposes to Ca_2CuO_3 + CuO) are made separately, then combined and reacted inside the silver sheath of powder-in-tube (PIT) specimens. This presentation describes efforts to increase the Jc of Bi-2223 PIT tapes by improving the alignment and connectivity of Bi-2223 grains. It will be shown that milling of precursor powders causes pickup of carbon, which resides at grain boundaries and disrupts grain-to-grain connectivity, but that the carbon-content can be reduced by vacuum calcination of the mixed powder (i.e. 2212 + $CaCuO_2$) before it is loaded into the silver tube. In addition, it is shown that slight changes in overall composition dramatically affect the final microstructures and may be important for improving the properties of tapes. Finally, a silver wire-in-tube method is described as a method for possibly improving grain alignment by increasing the interfacial area between silver and superconductor.

15906 (CONF-9407153–Vol.1, pp. 450-481) **Thick-film and power-in-tube processing for superconducting thallium oxide tape via an electrodeposition process.** Bhattacharya, R.N. (National Renewable Energy Lab., Golden, CO (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The electrodeposition process for fabricating superconducting thallium oxide tape is outlined. The following topics are discussed: advantages of the electrodeposition process, electrolyte composition for film composition, reproducibility and compositional uniformity, annealing of TBCCO film, electrodeposition powder process, influence of (PIT) thermomechanical processing on critical current density, and x-ray diffraction data. Conclusions and future plans are summarized.

15907 (CONF-9407153–Vol.1, pp. 682-690) **Phase stability of Tl, Pb-1223.** Aselage, T. (Sandia National Labs., Albuquerque, NM (United States)). USDOE Assistant Secretary for Energy Efficiency and Renewable Energy, Washington, DC (United States). 29 Jul 1994. From Superconductivity program for electric power systems; Alexandria, VA (United States); 19-20 Jul 1994. In *Superconductivity Program for electric power systems: 1994 annual PEER review.* 690p. Order Number DE95005058. Source: OSTI; NTIS; GPO Dep.

The phase stability of Tl, Pb-1223 was studied and presented in outline form. The following topics are discussed: background (BES), Tl-Ba-Ca-Cu-O phase diagrams, (Tl,Pb)-1223 stability region, and (Tl,Pb)-1223 properties change with P(Tl_2O). Future work is summarized.

15908 (CONF-941144–116) **Porous spherical shells and microspheres by electrodispersion precipitation.** Harris, M.T.; Sisson, W.G.; Basaran, O.A.; Hayes, S.M.; Bobrowski, S.J. Oak

Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95009073. Source: OSTI; NTIS; INIS; GPO Dep.

The ability to reproduce the synthesis of dense- and porous-microspheres and micron-sized spherical shells is very important in (a) the development of ceramics for structural, electronic, catalyst and thermal applications; and (b) the encapsulation of products for controlled-release of drugs, flavors and perfumes, and inks and dyes, and the protection of light-sensitive components and mechanical support of fragile materials. Larger metallic- and ceramic-spherical shells have been used in inertial confinement fusion (ICF) experiments and as catalyst supports. The current paper will focus on a recent technique that has been developed for synthesizing ceramic microspheres and micro-shells. Pulsed electric fields have been used to enhance the dispersion of aqueous metal (Zr and Al) salt solutions from a nozzle and into a nonconducting liquid continuous phase that is immiscible with the aqueous phase. The diameter of the resulting microdroplets ranged in size from approximately 0.1 to 10 μm. Precipitation of hydrous metal oxides occurred as ammonia, which was dissolved in varying amounts in the continuous phase, diffused into the aqueous microdroplets. Spherical shells were formed at higher ammonia concentrations and microspheres were produced at lower ammonia concentrations. Upon drying, dimples appeared in the particles that were synthesized at higher ammonia concentrations. The latter result accords with the well known fact that under certain conditions spherical shells collapse when a fluid is extracted from the core of the particle. No dimples were observed in the microspheres that were produced at lower ammonia concentrations. Analog X-ray dot maps for aluminum and zirconium were done to determine the spatial distribution of each metal in the particles.

15909 (CONF-941144–133) **Microstructure of Al_2O_3 irradiated with an applied electric field.** Zinkle, S.J.; Hunn, J.D.; Stoller, R.E. Oak Ridge National Lab., TN (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States);Oak Ridge Inst. for Science and Education, TN (United States). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95010278. Source: OSTI; NTIS; INIS; GPO Dep.

A thin amorphous film of alumina was irradiated with 2-MeV He^+ ions at ~400 C up to a damage level of about 0.01 displacements per atom (dpa). The alumina films were sufficiently thin (~1.8 μm) to allow the ion beam to be completely transmitted through the specimen. An electric field of ~280 V/mm (dc) was applied continuously during the irradiation. Radiation induced electrical degradation (RIED), i.e. a permanent increase in the conductance of the film, was observed in specimens irradiated at temperatures near 400 to 450 C but did not occur in a specimen irradiated above 500 C. Transmission electron microscopy found no evidence for colloid formation. The observed increase in the conductance of the alumina film may be due to radiation-induced microcracking.

15910 (CONF-950129–4) **Stress relaxation of silicon nitride at elevated temperatures.** Wereszczak, A.A. (Oak Ridge National Lab., TN (United States)); Ferber, M.K.; Kirkland, T.P.; Lara-Curzio, E.; Parthasarathy, V.; Gribb, T.T. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 19. annual conference on advanced ceramics, materials and structures; Cocoa Beach, FL (United States); 9-12 Jan 1995. Order Number DE95009177. Source: OSTI; NTIS; GPO Dep.

The stress relaxation behavior of SN88, SN253, and NCX-5102 silicon nitride materials were experimentally determined in tension at 1300°C using buttonhead specimens. Specimens were held at constant strain after being loaded at 10 MPa/s to an initial stress of 276 MPa (40 ksi) or 414 MPa (60 ksi). The subsequent decay in tensile stress was measured as a function of time. A non-negative least squares algorithm used in conjunction with a generalized Maxwell model proved to be an efficient means to define characteristic relaxation modulus spectra and stress relaxation behavior. In the last part of this study, the utility of using short-term stress relaxation testing to predict long-term creep performance was examined.

15911 (CONF-950129–6) **Gelcasting of sintered reaction-bonded silicon nitride for improved mechanical properties.** Maria, J.P.; Kiggans, J.O.; Tiegs, T.N.; Nunn, S.D. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 19. annual conference on advanced ceramics, materials and structures; Cocoa Beach, FL (United States); 9-12 Jan 1995. Order Number DE95010282. Source: OSTI; NTIS; GPO Dep.

Gelcasting of silicon metal for the production of sintered reaction bonded silicon nitride (SRBSN), was investigated in order to identify associated advantages over conventional forming techniques; i.e., die and isostatic pressing. Compacts were formed from identical powder mixtures by both gelcasting and pressing, and were nitrided and sintered to produce SRBSN ceramics. Characterization of the samples included measurement of green density, green and nitrided pore structure, weight gain during nitridation, final density, microstructure, toughness, and flexural strength. It was found that a more uniform pore structure existed in the green gelcast samples. It is believed that this pore configuration aided in nitridation, and manifested itself in a more uniform final microstructure. In addition, improved mechanical properties were achieved in the gelcast samples. This improvement can be attributed to green microstructure homogeneity.

15912 (CONF-950629–5) **Predictions of tensile behavior and strengths of a Si_3N_4 ceramic at high temperatures based on a viscoplastic model.** Liu, K.C. (Oak Ridge National Lab., TN (United States). Metals and Ceramics Division); Brinkman, R.; Ding, Jow-Lian; Lin, Shenghin. Oak Ridge National Lab., TN (United States); Washington State Univ., Pullman, WA (United States). Dept. of Mechanical and Materials Engineering. [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From ASME international gas turbine and aeroengine congress and exposition: land, sea and air; Houston, TX (United States); 5-8 Jun 1995. Order Number DE95010220. Source: OSTI; NTIS; GPO Dep.

Tensile deformation and rupture behavior were simulated using a viscoplastic model developed recently. The model was formulated based on the state variable approach, which provides flexibility and versatility for characterizing the time-dependent behavior of ceramic materials under general thermomechanical loading conditions. Simulations portrayed by the model were compared with experimental tensile data obtained under two different tensile stressing rates. Results showed that the model was capable of simulating deformation behavior for all practical engineering purposes, but estimated high-temperature fracture strengths somewhat conservatively.

15913 (DOE/CE/15599–T2) **Whisker reinforced glass ceramic. Quarterly progress report number 2, December 27, 1994–March 27, 1995.** Pickrell, G.R.; Brown, J.J. Jr. Materials Technologies of Virginia, Inc., Blacksburg, VA (United States). 25 Apr 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG01-94CE15599. Order Number DE95010542. Source: OSTI; NTIS; GPO Dep.

The goal of this project is to investigate the physical properties of an in-situ whisker reinforced glass ceramic material and to produce prototype heat exchanger tubes for testing in a coal combustion environment. The in-situ whisker reinforced glass ceramic process was developed and patented at Virginia Tech and licensed to MATVA. Successful completion of this project will demonstrate the potential for this new material to replace existing heat exchanger materials due to its superior chemical and physical properties. This report covers the progress made during this period. Topics covered here are glass melting and sample preparation. Density and microstructure results are given for samples.

15914 (DOE/ER–0313/16, pp. 493-504) **Radiation-induced changes in electric, dielectric and optical properties of ceramics.** Zinkle, S.J. (Oak Ridge National Lab., TN (United States)). Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

The data base on radiation-induced changes in the electric and dielectric properties of ceramic insulators is reviewed. Ionizing radiation causes a prompt increase in the electrical conductivity that is generally proportional to the ionizing dose rate. The precise magnitude of the radiation induced conductivity is sensitive to the detailed manufacturing process and impurity content. The conflicting evidence regarding the possibility of permanent radiation induced electrical degradation (RIED) is summarized. Further work is needed to define the physical mechanism and practical operating limits of the RIED phenomenon. Displacement damage associated with neutron irradiation produces significant increases in the room temperature dielectric loss tangent of oxide ceramics for fast neutron fluences above 1 x 10^{22} n/m^2 (~0.001 dpa). A brief summary of the effects of irradiation on the optical properties of ceramics and silica optical fibers is also presented.

15915 (DOE/ER–0313/16, pp. 512-516) **Electrical properties of Al_2O_3 during irradiation with spallation neutrons.** Farnum, E.H. (Los Alamos National Lab., NM (United States)); Clinard, F.W. Jr. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994*. 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

DC and AC conductivity of Al_2O_3 ceramics were measured at elevated temperatures during irradiation with neutrons and gamma rays at the Los Alamos Spallation Radiation Effects Facility. DC conductivity was increased at start of irradiation, but was subsequently reduced as displacement damage was accumulated. AC conductivity appeared to increase at high levels of damage. The observed dc behavior is attributed to excitation of electrons into the conduction band by ionizing radiation, followed by charge trapping and recombination at damage sites. The ac behavior, which resembles RIED, is attributed to conductivity in the residual gas surrounding the samples. Surface conductivity, while not the source of the apparent RIED, nevertheless is of sufficient magnitude to be of concern for fusion applications.

15916 (DOE/ER–0313/16, pp. 523-527) **Neutron-induced changes in optical properties of $MgAl_2O_4$ spinel.** Ibarra, A. (CIEMAT, Madrid (Spain)); Garner, F.A. Oak Ridge National Lab., TN (United States). Sep 1994. DOE Contract AC06-76RL01830. In *Fusion materials semiannual progress report for the period ending March 31, 1994*. 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

High purity $MgAl_2O_4$ spinel specimens irradiated in FFTF-MOTA to very high exposure have been examined by three techniques to determine changes in their optical properties. Significant changes were observed in optical absorption, photoluminescence and radioluminescence.

15917 (ENEA-RT-INN–94-46) **Enea contribution to development of sol-gel technologies.** Vatteroni, R. (ENEA, Casaccia (Italy). Area Energia e Innovazione); Arcangeli, G.; Borrello, A.; Majani, C.; Picconi, C. ENEA, Casaccia (Italy). Area Energia e Innovazione. Nov 1994. 35p. (RT/INN–94-46). Order Number DE95771031. Source: OSTI; NTIS (US Sales Only).

Compared with conventional ceramic processes, the Sool-Gel technology, invented at the end of sixties for the preparation of ceramic nuclear fuel, seems suitable for obtaining pure and homogeneous fine grade precursors with a deeper control of chemical purity and crystallinity. In the frame of some agreements with other italianrResearch institutes, ENEA (Italian Agency for New Technologies, Energy and Environment) has applied the Sol-Gel technologies to the development of a few advanced ceramic materials; some of these particular applications are described in this report.

15918 (INIS-BR–3502) **The effects of additives (MgO, La_2O_3 and Y_2O_3) in the translucency of alumina.** Genova, L.A.; Bressiani, A.H.A.; Bressiani, J.C. Instituto de Pesquisas Energeticas e Nucleares (IPEN), Sao Paulo, SP (Brazil). 1993. 11p. (CONF-9308265–: Seminar on Technology Capacity of Materials, Sao Paulo (Brazil), 19 Aug 1993). Order Number DE95627670. Source: OSTI; NTIS (US Sales Only); INIS.

The effect of the addition of small amounts of Mg O, La_2O_3 and Y_2O_3 in the optical characteristics of the high purity alumina has been studied. Specimens with high transmittance in the visible region has been obtained. High purity alumina powders have also been obtained through the crystallization of ammonium alum. Translucent samples have been produced from these powders. (author). 6 refs, 5 figs, 4 tabs.

15919 (IS-M–812) **Superconductivity, magnetism and metal-insulator transitions in some ternary and pseudoternary 3d-, 4d- and 5d-metal oxides.** Johnston, D.C. (Ames Lab., IA (United States)); Borsa, F.; Kim, K.H.; Manajan, A.V.; Miller, L.L.; Torgeson, D.R.; Wang, Z.R.; Ami, T.; Crawford, M.K.; Hariow, R.L. Oak Ridge National Lab., TN (United States). [1994]. 23p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400 ; W-7405-ENG-82. (CONF-9410283–1: 17. international Taniguchi symposium on theoretical physics on spectroscopy of Mott Insulators and Correlated Metals, Shima (Japan), 24-29 Oct 1994). Order Number DE95005904. Source: OSTI; NTIS; INIS; GPO Dep.

Electron conduction effects have been found to be particularly important in the metallic compounds LiV_2O_4 and possibly $Sr_2Ir_{1-x}Ru_xO_4$ ($x > 0.7$), but not in metallic $Sr_{1-x}La_xVO_3$ ($x < 0.7$), and they cause the compounds Sr_2IrO_4 and ZnV_2O_4 to be (Mott-Hubbard) insulators. The LiV_2O_4 spinel compound is especially interesting, because the V ions exhibit rather clear local moment ($S = 1/2$) behavior even though the compound is a metal. 6 figures, 30 references.

15920 (IS-M–814) **Phase transformations in melt-spun Y-Ba-Cu-O bulk superconductor.** Wu, H.; Kramer, M.J.; Dennis, K.W.; McCallum, R.W. Ames Lab., IA (United States). [1994]. 4p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. (CONF-941013–34: Applied superconductivity conference, Boston, MA (United States), 16-21 Oct 1994). Order Number DE95010237. Source: OSTI; NTIS; GPO Dep.

Powders of $YBa_2Cu_3O_7$ (Y123) and compositions around Y123 were heated by a containerless process and melt-spun in 21% oxygen atmosphere at temperatures of 1400 to 1650 C. Homogeneous materials were obtained with micron and submicron crystalline phases uniformly dispersed in an amorphous matrix. For Y123, the crystalline phases are identified by XRD as $BaCu_2O_2$ and Y_2O_3 when the melt-spinning temperature is below 1600 C. At 1650 C, the crystalline phases are $Y_4Ba_3O_9$, $BaCu_2O_2$ and Y_2O_3. The phase composition of the solidified melt is directly related to the oxygen content of the melt and can be related to the equilibrium phase diagrams at lower oxygen partial pressures. Isothermal annealing is oxygen at temperatures 500 to 950 C reveals that the crystallization sequence is: Y123 begins to form at 500 C, Y123 with minor amount of Y_2BaCuO_5 at 800 C, Y123 with very minor amount of CuO at 900 C, and single phase Y123 at 950 C.

15921 (IS-M–816) **Anisotropic magnetization of $HoNi_2B_2C$.** Canfield, P.C. (Ames Lab., IA (United States)); Cho, B.K.; Johnston, D.C.; Hundley, M.F. Ames Lab., IA (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. (CONF-941144–124: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95010239. Source: OSTI; NTIS; GPO Dep.

Anisotropic, temperature dependent magnetization measurements on single crystals of $HoNi_2B_2C$ indicate that there is a cascade of magnetic transitions in zero and low applied magnetic fields. Comparison of the temperature dependence of the specific heat and $d(\chi T)/dT$ data shows a remarkable agreement in the low field limit, supporting the use of $d(\chi T)/dT$ as a method of determining the magnetic transition temperatures as a function of applied field. The magnetic transition temperatures determined by this analysis are remarkably sensitive to the applied field and highly anisotropic. Comparison to similar data for $ErNi_2B_2C$ show that the sensitivity and anisotropy are common features. These data emphasize the importance of anisotropic measurements of field dependent properties on single crystal samples, since the application of a magnetic field to a polycrystalline sample will effectively broaden the transition temperatures.

15922 (IS-T–1719) **A metallurgical approach toward alloying in rare earth permanent magnet systems.** Branagan, D.J.

Ames Lab., IA (United States). 23 Feb 1995. 274p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE95010242. Source: OSTI; NTIS; GPO Dep.

The approach was developed to allow microstructural enhancement and control during solidification and processing. Compound additions of Group IVA, VA, or VIA transition metals (TM) and carbon were added to $Nd_2Fe_{14}B$ (2-14-1). Transition metal carbides formed in IVA (TiC, ZrC, HfC) and Group VA (VC, NbC, TaC) systems, but not in the VIA system. The alloying ability of each TM carbide was graded using phase stability, liquid and equilibrium solid solubility, and high temperature carbide stability. Ti with C additions was chosen as the best system. The practically zero equilibrium solid solubility means that the Ti and C additions will ultimately form TiC after heat treatment which allows the development of a composite microstructure consisting of the 2-14-1 phase and TiC. Thus, the excellent intrinsic magnetic properties of the 2-14-1 phase remain unaltered and the extrinsic properties relating to the microstructure are enhanced due to the TiC stabilized microstructure which is much more resistant to grain growth. When Ti + C are dissolved in the liquid melt or solid phases, such as the glass or 2-14-1 phase, the intrinsic properties are changed; favorable changes include increased glass forming ability, reduced optimum cooling rate, increased optimum energy product, and enhanced nucleation kinetics of crystallization.

15923 (IS-T–1729) **Processing and characterization of nanocrystalline molybdenum disilicide ($MoSi_2$) consolidated by hot isostatic pressing (HIP).** Haji-Mahmood, M.S. Ames Lab., IA (United States). 10 Feb 1995. 97p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE95010243. Source: OSTI; NTIS; GPO Dep.

This work studied the effect nanocrystalline processing may have on mechanical properties of $MoSi_2$ and the ease with which $MoSi_2$ powder can be processed into a bulk shape. ($MoSi_2$ presently is limited by poor strength above 1000 C and brittleness below DBTT.) This work studied cold and hot isostatic pressing (CIP, HIP). The attrited, CIPed, and HIPed samples were characterized by chemical analysis, XRD, SEM, microhardness, optical microscopy, and quantitative metallography (porosity, density). Fracture toughness of the nanocrystalline $MoSi_2$ was found to be a factor of two higher than conventional $MoSi_2$ and the hardness of 1500 C-HIPed compacts were higher, as well. Modulus test showed the calculated elastic constants to be higher than the original Cerac material.

Short communication. 8 refs. HIGH-TC SUPERCONDUCTORS/electric conductivity; HIGH-TC SUPERCONDUCTORS/tunnel effect; BISMUTH OXIDES; CALCIUM OXIDES; COPPER OXIDES; MONOCRYSTALS; STRONTIUM OXIDES; TEMPERATURE RANGE 0000-0013 K

16018 (JINR-D–14-94-269(v.2)) **Summaries of reports of the 30. Conference on low-temperature physics. Pt. 2. Quantum liquids and crystals. Low-temperature solid-state physics. Electron phenomena at low temperatures.** Rossijskaya Akademiya Nauk, Moscow (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 299p. (In Russian). (CONF-940961–: International conference on low-temperature physics, Dubna (Russian Federation), 6-9 Sep 1994). Order Number DE95627574. Source: OSTI; NTIS (US Sales Only); INIS.

Report thesises of the conference on the low-temperature physics are presented. The fundamental problems of solids low-temperature physics, quantum liquids and crystals. Specific features are considered of structures, magnetic and thermodynamic properties of metals, alloys and other materials, and also optical and electric properties of thin films.

16019 (JINR-D–14-94-269(v.2), pp. 60-61) **Magnetic properties of dipole magnetic $CsGd(MoO_4)_2$ at low temperatures.** Anders, A.G. (AN Ukrainskoj SSR, Kharkov (Ukraine). Fiziko-Tekhnicheskij Inst. Nizkikh Temperatur); Volotskij, S.V.; Startsev, S.V.; Feger, A.; Orendacheva, A. Rossijskaya Akademiya Nauk, Moscow (Russian Federation); Joint Inst. for Nuclear Research, Dubna (Russian Federation). 1994. 299p. (In Russian). 16043 (LA–12825-T) **Solution based temperature of Perovskite-type oxide films and powders.** McHale, J.M. Jr. (Temple Univ., Philadelphia, PA (United States). Dept. of Chemistry). Los Alamos National Lab., NM (United States). Apr 1995. 210p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. Order Number DE95009089. Source: OSTI; NTIS; GPO Dep.

Conventional solid state reactions are diffusion limited processes that require high temperatures and long reaction times to reach completion. In this work, several solution based methods were utilized to circumvent this diffusion limited reaction and achieve product formation at lower temperatures. The solution methods studied all have the common goal of trapping the homogeneity inherent in a solution and transferring this homogeneity to the solid state, thereby creating a solid atomic mixture of reactants. These atomic mixtures can yield solid state products through "diffusionless" mechanisms. The effectiveness of atomic mixtures in solid state synthesis was tested on three classes of materials, varying in complexity. A procedure was invented for obtaining the highly water soluble salt, titanyl nitrate, $TiO(NO_3)_2$, in crystalline form, which allowed the production of titanate materials by freeze drying. The freeze drying procedures yielded phase pure, nanocrystalline $BaTiO_3$ and the complete SYNROC-B phase assemblage after ten minute heat treatments at 600°C and 1100°C, respectively. Two novel methods were developed for the solution based synthesis of $Ba_2YCu_3O_{7-x}$ and $Bi_2Sr_2Ca_2Cu_3O_{10}$. Thin and thick films of $Ba_2YCu_3O_{7-x}$ and $Bi_2Sr_2Ca_2Cu_3O_{10}$ were synthesized by an atmospheric pressure, chemical vapor deposition technique. Liquid ammonia solutions of metal nitrates were atomized with a stream of N_2O and ignited with a hydrogen/oxygen torch. The resulting flame was used to coat a substrate with superconducting material.

Bulk powders of $Ba_2YCu_3O_{7-x}$ and $Bi_2Sr_2Ca_2Cu_3O_{10}$ were synthesized through a novel acetate glass method. The materials prepared were characterized by XRD, TEM, SEM, TGA, DTA, magnetic susceptibility and electrical resistivity measurements.

16044 (LA-UR–95-972) **A valence-fluctuation mechanism with highly anisotropic S-wave pairing.** Brandow, B.H. Los Alamos National Lab., NM (United States). [1995]. 3p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950356–1: Stanford conference on spectroscopies in novel superconductors, Stanford, CA (United States), 15-18 Mar 1995). Order Number DE95009419. Source: OSTI; NTIS; GPO Dep.

The author has developed a fairly ab initio theory of cuprate superconductivity, based on the concept that the above-T_c state is a normal Fermi liquid with strong electronic correlations of the type found in valence-fluctuation (VF) and heavy-fermion materials. The ground-state-correlation aspect is found to provide a satisfactory source or mechanism for the pairing. In addition to the high T_c's this explains many of the unusual features of cuprate superconductivity.

16045 Method for plating with metal oxides. Silver, G.L.; Martin, F.S. To Dept. of Energy. 1993. Filed date 5 Mar 1993. U.S. Patent Application 8-026,643. 26p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-76DP00053. Order Number DE95009975. Source: OSTI; NTIS (US Sales Only); GPO Dep.

A method of plating hydrous metal oxides on at least one substrate, which method is indifferent to the electrochemical properties of the substrate, and comprises reacting metallic ions in aqueous solution with an appropriate oxidizing agent such as sodium hypochlorite or calcium oulfite with oxygen under suitable conditions of pH and concentration such that oxidation and precipitation of metal oxide are sufficiently slow to allow satisfactory plating of metal oxide on the substrate.

16046 (SAND–94-2869C) **Shock properties of high-strength ceramics.** Grady, D.E. Sandia National Labs., Albuquerque, NM (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950788–5: International conference on computational engineering science, Mauna Lani, HI (United States), 30 Jul - 3 aug 1995). Order Number DE95007731. Source: OSTI; NTIS; GPO Dep.

A broad class of brittle solids subjected to large amplitude shock waves can support substantial shear stress (of order 2-10 GPa) without failing due to the very limited slip systems in these materials. When failure occurs under sufficiently intense shock loading, the effect is usually observed as a wave splitting in the compressive shock front. Because of the high confining stress state associated with the failure event in the shock compression environment, it is no longer certain whether the microstructural processes of deformation are brittle or ductile. Some, although by no means sufficient, evidence supports a brittle deformation mechanism in the materials of interest. The present short paper focuses on two aspects of the transition regime neighboring the HEL in the compressive shock process. First, issues of rate dependence associated with prompt yield under shock compression are not well understood. We report here on observations of wave profile data on ceramics, examining he issue of elastic precursor decay. Also in this study, a number of the experimental observations of failure waves in ceramic materials (principally glass) are surveyed. Some of the principal results are summarized and dynamic failure mechanisms consistent with these results are discussed.

16047 (SAND–95-0322C) **Synthesis of novel precursors for PMN powders and the thin films obtained from them.** Boyle, T.J.; Dimos, D.B.; Moore, G.J. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503115–1: International symposium on advanced synthesis and processing, College Station, TX (United States), 11-15 Mar 1995). Order Number DE95008543. Source: OSTI; NTIS; GPO Dep.

Sol-gel processing has been widely used in the preparation of lead zirconate titanate (PZT) thin films. The authors have applied this methodology to the formation of lead magnesium niobate (PMN) spin-cast deposited thin films. Since there is a limited number of soluble, commercially available compounds, the authors have recently synthesized a series of novel metal alkoxides for use as precursors for generation of PMN thin films and powders. The process for generation of the perovskite phase of these PMN powders and films are reported.

16048 (SAND–95-0567C) **Mechanism(s) for the suppression of the switchable polarization in PZT and $BaTiO_3$.** Warren, W.L. (Sandia National Labs., Albuquerque, NM (United States)); Dimos, D.; Tuttle, B.A.; Pike, G.E.; Raymond, M.V.; Nasby, R.D.; Ramesh, R.; Evans, J.T. Jr. Sandia National Labs., Albuquerque, NM (United States). [1995]. 15p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941144–121: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95009589. Source: OSTI; NTIS; GPO Dep.

Switchable polarization can be significantly suppressed in ferroelectric (FE) materials by optical, thermal, and electrical processes. The thermal process can occur by either annealing the FE in a reducing environment or by heating it in air to 100 C while impressing a bias near the switching threshold. The optical process occurs while biasing the FE near the switching threshold and illuminating with bandgap light. And the electrical suppression effect occurs by subjecting the FE to repeated polarization reversals. Using electron paramagnetic resonance, polarization-voltage measurements, and charge injection scenarios, the authors have been able to elucidate both electronic and ionic trapping effects that lead to a suppression in the amount of switchable polarization in FE materials. The relative roles of electronic and ionic effects in the same material can depend on the stress condition. For instance, in oxidized BaTiO3 crystals, optical and thermal suppressions occur by electronic domain pinning; electrical fatigue in the $BaTiO_3$ crystals also appears to involve electronic charge trapping, however, it is suggested that these electronic traps are further stabilized by nearby ionic defects. In sol-gel PZT thin films with either Pt, RuO_2, or La-Sr-Co-O electrodes it appears that the polarization suppression induced by electrical fatigue, a temperature/bias combination, or a light/bias combination are all primarily due to the trapping of electronic charge carriers to first order.

16049 (SAND–95-0735C) **The pyrochlore-to-perovskite transformation in solution-derived lead zirconate titanate thin films.** Voigt, J.A.; Tuttle, B.A.; Headley, T.J.; Lamppa, D.L. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-941267–1: 4. Material Research Society-Ferroelectric thin films conference, Boston, MA (United States), 5-9 Dec 1994). Order Number DE95010453. Source: OSTI; NTIS; GPO Dep.

The authors have characterized the pyrochlore-to-perovskite crystallization process in solution-derived $Pb(Zr_{0.20}Ti_{0.80})O_3$ thin films on (100) MgO single crystal substrates. It has been determined that the perovskite phase nucleated preferentially at the film/MgO interface out of a nanocrystalline (≈100Å grains) pyrochlore matrix. During the early stages of the pyrochlore-to-perovskite conversion process, perovskite growth proceeded nearly isotropically from the substrate to form hemispherically shaped grains. Deviations from isotropic growth were shown to result from a growth dependence based on the crystallographic orientation of a growing perovskite grain relative to the orientations of pyrochlore grains being transformed. The volume change that occurs during the pyrochlore-to-perovskite transformation along with two-dimensional grain growth has been used to develop a mechanism for formation of porosity that commonly is concentrated in grain boundary regions.

16050 (Y/DV–1356) **Development of ceramic-coated weld backing bars.** Eggleston, B.R. Oak Ridge National Lab., TN (United States). 20 Oct 1994. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009313. Source: OSTI; NTIS; GPO Dep.

In shipbuilding and many other industries, copper weld backing bars are used to draw the heat out of the weld. The problem that some users of these bars encounter is that these bars, on occasion, actually melt in spots and become welded to the weld plates. After

this happens a number of times, the backing bar becomes so degraded that it must be either discarded or machined, both of which are very costly and time-consuming actions. To avoid this fusion between the backing bar and the weld plate, the weld processes that are used cannot be ones of high beat input. This requirement is very limiting when thick plates are being welded. The plates must be beveled, and more weld passes must be run. These problems are also costly and time consuming. The aim of this project is to find a way to produce backing bars with nearly the same 'chilling' effect but with both a greater resistance to molten metal and resistance to arcing to the backing bar itself. A possible solution currently being tested is to coat the copper bars with a thin layer of a ceramic coating. The procedure used was to coat the copper bars with either alumina or spinel by a plasma spraying method.

16051 (Y/DW–1352) **Nondestructive testing of ceramic components: Cooperative research and development agreement completion report.** Carpenter, D.A.; Dews, T.W.; Moyer, M.W.; Oakes, R.E. Oak Ridge National Lab., TN (United States). 22 Dec 1994. 34p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. Order Number DE95009510. Source: OSTI; NTIS; INIS; GPO Dep.

In a joint Cooperative Research and Development Agreement (CRADA) between Martin Marietta Energy Systems (MMES) and an industrial partner, Y-12 has been evaluating nondestructive evaluation (NDE) techniques to identify the quality of high strength aluminum oxide tubes used in laser applications. In Phase I, several NDE techniques were developed to inspect the tubes. In Phase II a correlation between detected defects, actual failure mode and strength of the tubes was developed. In Phase II the industrial partner supplied tubes manufactured under a variety of conditions and containing material defects expected from process control variations. The tubes were inspected at MMES utilizing a variety of available acoustic techniques. After inspection, ring tensile specimens were fabricated to determine the tensile strength. The data were evaluated utilizing Weibull statistics to determine the statistical impact of the defects upon strength and correlate the data with the nondestructive evaluations of the tubes and observed defect distribution.

16052 (ANL/ET/CP–83786) **Influence of fiber content on mechanical performance of SiC-fiber-reinforced reaction-bonded silicon nitride composites.** Singh, D. (Argonne National Lab., IL (United States). Energy Technology Div.); Singh, J.P.; Bhatt, R.T. Argonne National Lab., IL (United States). Jan 1995. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. (CONF-950129–5: 19. annual conference on advanced ceramics, materials and structures, Cocoa Beach, FL (United States), 9-12 Jan 1995). Order Number DE95009903. Source: OSTI; NTIS; GPO Dep.

The effect of fiber content on the resulting mechanical properties (first matrix cracking stress, ultimate strength, and work-of-fracture) of silicon carbide (SiC)-fiber-reinforced reaction-bonded silicon nitride (RBSN) matrix composites was investigated. Flexure tests were used to evaluate mechanical properties of composites containing various fiber contents. The first matrix cracking stress, ultimate strength, and work-of-fracture of the composites increased with increasing fiber content, reaching a peak value at a fiber content of $\sim$ 16 vol.%. Further increases in fiber content degraded the mechanical properties of the composites. The variations in mechanical properties with fiber contents were correlated to the residual stresses in the matrix phase, processing related flaws, and failure modes observed in these composites.

16053 (ANL/MSD/PP–80065) **First-principles calculations of surface energy and electronic structure of LIF, NaCl and MgO (100) surfaces.** Guo, J. (Argonne National Lab., IL (United States). Materials Science Div.). Argonne National Lab., IL (United States). Jun 1993. 28p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-31109-ENG-38. Order Number DE95005832. Source: OSTI; NTIS; GPO Dep.

Surface energy and electronic structure of LiF, NaCl and MgO (100) surfaces were calculated using the self-consistent-field Discrete Variational (DV) embedded cluster method in the local density approximation (LDA). Clusters of 100–164 atoms embedded in the semi-infinite host lattices were used to achieve the desired convergence. The (100) surface energies of 0.75J/m^2, 0.47J/m^2 and 1.53J/m^2 calculated for LiF, NaCl, and MgO, respectively, were compared with experimental data and other theoretical values. The surface atoms of LiF and NaCl were found to maintain their bulk ionic characters. The effective charges of MgO surface atoms were found to differ from the bulk atoms. The surface charge density contours were plotted and their corrugation amplitudes were compared with the He-atom diffraction results. The surface partial density of states were compared with optical, photoemission, and electron energy loss spectroscopic results.

16054 (AUC-IBT-R–9413) **Dense low-cement binders with microsilica and fly ash. Structure and properties.** Dalsgaard Holland, A. Aalborg Universitetscenter (Denmark). Inst. for Bygningsteknik; Aalborg Portland (Denmark). Cement- og Betonlaboratoriet; Akademiet for de Tekniske Videnskaber, Lyngby (Denmark). May 1994. 323p. (In Danish). (CBL–52). Order Number DE95772416. Source: OSTI; NTIS.

The industrial researcher project has comprised investigations of structure and properties of very dense binders containing fly ash and microsilica and low contents of cement - LCD-binders. The LCD-binders based on the Densit-concept, which was developed at Aalborg Portland A/S. The designation 'LCD' refers to low cement Densit because of the parallel til the Densit-binders. The Densit-concept is based on binders consisting of densely packed cement particles having an average size of approx. 10 μm and 20-30 vol-% ultra fine particles having average size of approx. 0,1 μm, e.g. microsilica, placed between the densely packed cement particles. Using the Densit-concept, i.a. strengths 2-5 times those of conventional concrete have been reached. The fine particles can be chosen to provide specific properties of the binders, e.g. high wear resistance or specific magnetic properties. Also undersirable properties, such as heat development and hydration shrinkage, caused by the cement, can be reduced by substituting a part of the cement by non-reactive/less reactive materials such as for instance fly ash. Mechanical properties like strength and elasticity remain almost unchanged at a substitution of as much as 75 vol-% of the cement. The higher strengths imply the prospect of making more elegant, larger and slimmer constructions, resulting in less materials consumption. In the project the fine particles, besides cement, are fly ash only. A large spectrum of LCD-binders in regard to particle composition has been investigated. Binders with contents of microcilica varying between 0 and 30 vol-% of the binder particles, and binders with contents of cement varying between 1,5 and 100 vol-% of the fine particles, i.e. cement + fly ash, have been investigated, (EG) (49 refs.)

16056 (BNL–61149, pp. 333-334) **Radiation effects on polymers.** Link, J. (Univ. of Washington, Seattle, WA (United States)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry*. 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

There has been a lot of speculation on radiation sensitivity of materials. Some of the comments about materials problems due to radiation sensitivity made no sense given the radiation fields and time for which these materials were exposed to those radiation fields. Radiation sensitivity of polymeric materials has been studied. Publications considered are from CERN-European Organization for Nuclear Research.

16057 (CONF-941144–104) **Fabrication and modification of metal nanocluster composites using ion and laser beams.** Haglund, R.F. Jr. (Vanderbilt Univ., Nashville, TN (United States)); Osborne, D.H. Jr.; Magruder, R.H. III; White, C.W.; Zuhr, R.A.; Townsend, P.D.; Hole, D.E.; Leuchtner, R.E. Oak Ridge National Lab., TN (United States). Dec 1994. 12p. Sponsored by USDOE, Washington, DC (United States);Science and Engineering Research Council, Swindon (United Kingdom);North Atlantic Treaty Organization, Brussels (Belgium);Department of Defense, Washington, DC (United States). DOE Contract AC05-84OR21400. Contract DAAH04-93-G-0123. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95009131. Source: OSTI; NTIS; INIS; GPO Dep.

Metal nanocluster composites have attractive properties for applications in nonlinear optics. However, traditional fabrication techniques – using melt-glass substrates – are severely constrained by equilibrium thermodynamics and kinetics. This paper describes the fabrication of metal nanoclusters in both crystalline and glassy hosts by ion implantation and pulsed laser deposition. The size and size distribution of the metal nanoclusters can be modified by controlling substrate temperature during implantation, by subsequent thermal annealing, or by laser irradiation. The authors have characterized the optical response of the composites by absorption and third-order nonlinear-optical spectroscopies; electron and scanning-probe microscopies have been used to benchmark the physical characteristics of the composites. The outlook for controlling the structure and nonlinear optical response properties of these nanophase materials appears increasingly promising.

16058 (CONF-941144–105) **Amorphization threshold in Si-implanted strained SiGe alloy layers.** Simpson, T.W. (Univ. of Western Ontario, London, Ontario (Canada). Dept. of Physics); Love, D.; Endisch, E.; Goldberg, R.D.; Mitchell, I.V.; Haynes, T.E.; Baribeau, J.M. Oak Ridge National Lab., TN (United States). Dec 1994. 7p. Sponsored by USDOE, Washington, DC (United States);Ontario Centre for Materials Research, Kingston, ON (Canada). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95008901. Source: OSTI; NTIS; INIS; GPO Dep.

The authors have examined the damage produced by Si-ion implantation into strained $Si_{1-x}Ge_x$ epilayers. Damage accumulation in the implanted layers was monitored in situ by time-resolved reflectivity and measured by ion channeling techniques to determine the amorphization threshold in strained $Si_{1-x}Ge_x$ (x = 0.16 and 0.29) over the temperature range 30–110 C. The results are compared with previously reported measurements on unstrained $Si_{1-x}Ge_x$, and with the simple model used to describe those results. They report here data which lend support to this model and which indicate that pre-existing strain does not enhance damage accumulation in the alloy layer.

16059 (CONF-941144–115) **Interface degradation in CAS/Nicalon during elevated temperature aging.** Plucknett, K.P. (Oak Ridge National Lab., TN (United States)); Cain, R.L.; Lewis, M.H. Oak Ridge National Lab., TN (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States);European Economic Community, Brussels (Belgium). DOE Contract AC05-84OR21400. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95008843. Source: OSTI; NTIS; GPO Dep.

A $CaO-Al_2O_3-SiO_2$ (CAS)/Nicalon glass-ceramic matrix composite has been subjected to elevated temperature oxidation heat-treatments between 375 and 1200°C, for up to 100 hours. Micro- and macro-mechanical properties have been determined by fiber push-down, using a mechanical properties microprobe, and flexure testing, respectively. Aging between 450 and 800°C results in significant property degradation, with reduced bending modulus and flexure strength, increased fiber sliding stress, and a transition to a purely brittle failure mode. Aging degradation is due to oxidative removal of the carbon interlayer, with the subsequent formation of a silica bond between fiber and matrix. At higher temperatures, carbon is retained due to the formation of a protective silica plug at exposed fiber ends, with the subsequent retention of composite properties. Short duration pre-treatment schedules, at 1000 or 1100°C, were developed to prevent intermediate temperature property degradation.

16060 (CONF-941144–119) **Suppression of self-interstitials in silicon during ion implantation via in-situ photoexcitation.** Ravi, J. (North Carolina State Univ., Raleigh, NC (United States). Dept. of Materials Science and Engineering); Erokhin, Yu.; Christensen, K.; Rozgonyi, G.A.; Patnaik, B.K.; White, C.W. Oak Ridge National Lab., TN (United States). Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States);National Science Foundation, Washington, DC (United States). DOE Contract AC05-84OR21400. Grant DMR-9215538. From 1994 fall meeting of the Materials Research Society (MRS); Boston, MA (United States); 28 Nov - 2 dec 1994. Order Number DE95009173. Source: OSTI; NTIS; INIS; GPO Dep.

The influence of in-situ photoexcitation during low temperature implantation on self-interstitial agglomeration following annealing has been investigated using transmission electron microscopy (TEM). A reduction in the level of as-implanted damage determined by RBS and TEM occurs athermally during 150 keV self-ion implantation. The damage reduction following a 300 C anneal suggests that it is mostly divacancy related. Subsequent thermal annealing at 800 C resulted in the formation of (311) rod like defects or dislocation loops for samples with and without in-situ photoexcitation, respectively. Estimation of the number of self-interstitials bound by these defects in the sample without in-situ photoexcitation corresponds to the implanted dose; whereas for the in-situ photoexcitation sample a suppression of ≈2 orders in magnitude is found. The kinetics of the athermal annealing process are discussed within the framework of either a recombination enhanced defect reaction mechanism, or a charge state enhanced defect migration and Coulomb interaction.

16061 (CONF-950129–3) **Differences in creep performance of a HIPed silicon nitride in ambient air and inert environments.** Wereszczak, A.A.; Kirkland, T.P.; Ferber, M.K. Oak Ridge National Lab., TN (United States). [1995]. 9p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From 19. annual conference on advanced ceramics, materials and structures; Cocoa Beach, FL (United States); 9-12 Jan 1995. Order Number DE95009172. Source: OSTI; NTIS; GPO Dep.

High temperature tensile creep studies of a commercially available hot isostatically pressed (HIPed) silicon nitride were

conducted in ambient air and argon environments. The creep performance of this HIPed silicon nitride was found to be different in these environments. The material crept faster (and had a consequential shorter lifetime) in argon than in ambient air at 1370°C at tensile stresses between 110-140 MPa. The stress dependence of the minimum creep rate was found to be ≈ 6 in argon and ≈ 3.5 in air, while the minimum creep rates were almost an order of magnitude faster in argon than in air at equivalent tensile stresses. Differences in the creep performance are explained with reference to the presence or absence of oxygen in the two environments.

16062 (CTH-PUBL–93-8, pp. 34-39) **Influence of heat and moisture on PUR-insulations.** Rautiainen, L. (Technical Research Centre of Finland (Finland)). Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

The environmental stresses affecting thermal insulation boards in buildings are temperature (high and low) temperature variations, moisture (depends on the type of the constructions) and also small loads (e.g. snow load on roofs). The temperature rise and decrease cause thermal movements the magnitude of which is relatively well known. The high temperatures due to solar radiation are above +70 degrees C only limited times during the year. These high temperatures can fasten the cell gas diffusion to some extent but clear aging as hardening in the PUR matrix itself has not been found. The influence of moisture on thermal insulation has been most often taken account as an increase of thermal conductivity which is also relatively well known. Compared to the knowledge of influence of temperature or moisture on insulation, less attention has been directed to the combined effect of heat and moisture on insulation. As an example the behaviour of different PUR-formulations with different history will be presented. The tests were performed at the temperatures +40-+60 degrees C, part of pieces in the water bath and part at RH 90% or higher. The common behaviour seemed to be increased water absorption and increased dimensional changes (swelling and/or shrinkage) with increasing moisture-temperature stresses. Concerning some formulations it seems that in the constructions in which the presence of simultaneous heat and moisture stresses are probable the dimensional changes may arise problems. 7 tabs

16063 (CTH-PUBL–93-8, pp. 40-46) **CFC in used and new polyurethane foams.** Ramnaes, O. (Chalmers Univ. of Technology, Goeteborg (Sweden). Dept. of Chemical Environmental Science); Svanstroem, M. Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

The amount of CFC 11 in the polyurethane of used district heating pipes was determined. A special sampling device and a subsequent gas chromatographic analysis was used for the quantitative determination of CFC 11 in the gas phase. The total amount of CFC 11 in the foam and the amount of CFC 11 dissolved in the polymer matrix was determined by measuring reduction in weight. The heating pipes had been used for 1-20 years. For comparison, the amounts of CFC 11 in new district heating pipes were determined. Some newly manufactured pipes were analysed for their content of CFC 11, to make sure that certain specifications were followed. 8 refs, 3 tabs

16064 (CTH-PUBL–93-8, pp. 48-58) **The thermal conductivity of rigid PUR foam as a function of time.** Jarfelt, U. (Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology). Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. Project NUTEK-656-101. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

The change in thermal conductivity as a function of time for rigid polyurethane foam made with different blowing agents has been studied in this project which is the first in a series of tests on different blowing agents and material properties. The first report sets out the results relating to the composition of the cell gases over a period of 100 days in slabs of polyurethane of different densities, made with different blowing agents, CO_2, CFC 11, HCFC 141b, HFC 134a, HFC 152a, n-pentane and c-pentane. The test specimens were made in a high pressure machine, and the same mix compositions were used as far as possible. The polyol and isocyanate were not varied between the test materials. Differences in density were brought about by different degrees of overpacking. The thermal conductivity of slabs of 30 mm thickness was studied in a plate apparatus over a period of 100 days. Parallel with this determination, gas analyses were made on cell gas contained in the polyurethane material. On the basis of the partial pressure obtained, the diffusion coefficient for the blowing agent, oxygen and nitrogen was determined. 6 refs, 8 figs, 1 tab

16065 (CTH-PUBL–93-8, pp. 59-65) **A symmetrical sample arrangement for accurate creep measurements on rigid PUR foams at elevated temperatures.** Bergstroem, G. (Swedish National Testing and Research Institute, Goeteborg (Sweden). Dept. of Materials and Mechanics); Karlsson, J. Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

A symmetrical sample arrangement has been used to facilitate accurate measurement of the creep behaviour of closed cell PUR foams at elevated temperatures. Partly modelling the actual PUR foam boundary conditions in a district heating pipe, the symmetry of the measurement set-up balances dimensional changes caused by thermal expansion of the PUR structure and by changes in cell gas pressure. The rise in temperature causes the gas pressure in the closed cells to increase, and at the same time the changes in gas pressure accelerate due to higher gas diffusion rates. By applying the mechanical load on a symmetry plane, the zero point for creep measurement is stabilised by a factor of 10, and creep deformation can be measured virtually independently of changes in internal pressure. The measuring procedure produces elevated temperature data which do not suffer from the ambiguity of conventional TMA measurements. The creep properties of different PUR foam materials can therefore be compared directly irrespective of gas types etc. The measuring set-up described was successfully used in two reference PUR foams, FEBIS I (CFC blown) and FEBIS II (CO_2 blown). At a load of 50 kPa, the creep behaviour has been studied in the temperature range 23 degrees C to 170 degrees C over loading periods of to 2000 hours. 3 refs, 14 figs

16066 (CTH-PUBL–93-8, pp. 66-74) **HFA 134a and alkane blown PUR-foam. Two ODP-zero solutions for the refrigeration industry.** Klausen, K.H. (Tectrade A/S, Naerum (Denmark)). Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

The increasing demand for replacement of ozone depletion gases and even greenhouse creating gases has led to the development of various chlorine and halogen free PUR-foam systems. This paper will describe two different solutions which are developed specifically for the refrigeration industry. 4 figs, 1 tab

16068 (CTH-PUBL–93-8, pp. 96-105) **Quality documentation of foam density using non-destructive testing methods based on isotope techniques.** Fink, J. (FORCE Institutes, Broendby (Germany)); Teller, S.; Sevel, T. Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

Foam density is a key parameter in quality control of foam insulation products like polyurethane based refrigerators, freezing boxes, sandwich elements and constructions, and preinsulated district heating pipes. Production characteristics in the foaming process will affect the bulk density and the homogeneity of the foam. Voids may be created, etc. Over the years, this has created a need for non-destructive testing and quality documentation methods for regular control. The introduction of new foaming processes like the CFC-free approaches highlights this need for the manufacturer to be able to document that the quality of the new, environmentally friendly product is not deteriorated compared to the traditionally produced products already known by the consumer. Gamma-rays have shown to be well suited as a physical measuring principle for foam density measurements. A number of different instrumentations have been developed based on detection either of transmitted radiation or reflected radiation (access only required from one side). The instrumentations have proved to be both versatile and reliable tools for non-destructive quality documentation. New technology involving gamma radiation of different energies has recently been applied for complicated structures. X-ray methods have also been applied and new applications based on digital radiation detection are emerging. 3 refs, 6 figs

16069 (CTH-PUBL–93-8, pp. 108-119) **Towards more environmentally friendly rigid polyurethane foams.** Thijs, S. (Shell Research SA, Ottignies-Louvain-la-Neuve (Belgium). Chemical Research Centre). Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

Shell's approach to phase out CFCs in rigid polyurethane foams will be presented in this paper. Major progress has been achieved in the application areas of pipe insulation and continuous lamination. The approach, however, is quite different in the two applications because of the different requirements for processing and final product performance. In pipe insulation, several routes to replace CFCs have been considered. The introduction of alternative blowing agents has required the development of new polyols to overcome problems encountered in processing and end properties as a result of increased water levels in the formulations. These polyols have been developed after a thorough investigation of the influence of network parameters on the end properties of the polyurethane foam. In continuous lamination pentane technology is being implemented. Industrial scale trials have proven that pentane blown foam can be produced under safe working conditions. The processing performance and the foam physical properties are similar to CFC-11 blown foams. In both applications, the replacement of CFCs will reduce the insulation properties of the foam product. However, the increase of the initial and aged thermal conductivity remains at an acceptable level. Therefore, when choosing a CFC alternative, a balance has to be found between the environmental impact of the substitute and the final product performance. 5 refs, 5 figs, 3 tabs

16070 (CTH-PUBL–93-8, pp. 120-128) **Conditioning method for cellular plastics. Verification of the 'Nordtest method'.** Isberg, J. (Chalmers Univ. of Technology, Goeteborg (Sweden). Building Technology). Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. Order Number DE95766686. Source: OSTI; NTIS.

The tests carried out show that the values of thermal conductivity measured at different times and on different thicknesses of one and the same material are situated on the same curve when the thermal conductivity is plotted as a function of time/(thickness)^2. It is therefore possible to subject materials to accelerated ageing by reducing their thickness. 3 refs, 4 figs

16071 (CTH-PUBL–93-8, pp. 129-136) **Quantitative determination of gaseous components in cellular plastics.** Kokko, E. (Technical Research Centre of Finland (Finland). Lab. of Heating and Ventilation). Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. Order Number DE95766686. Source: OSTI; NTIS.

The aging of cellular plastics based on different blowing agents is because of many reasons of current interest. Both modelling of aging processes and development of different solution methods have created a need for direct measurement methods for different model parameters and for the aging behaviour of cellular plastics systems. The method described in this presentation is of latter type. Anyhow this method offers a possibility to determine values of model parameters by using a parameter identification technique too. In this case a competent aging model is needed. The method is very useful in determining the local values of total pressure in different foam systems. Because of great pressure differences in foams, the typical change in pressure level in crushing chamber can be 0-4 kPa without any problem to be measurable. Experiences of quantitative determination of partial gases are still few. It seems to be better to have an online connection from crushing chamber to GC-apparatus. Determination of the effective volume of samples is very sensitive for temperature variation. One must control the conditions and maintain carefully constant temperature level in the system during the registration of pressure values. 2 refs, 3 figs

16072 (CTH-PUBL–93-8, pp. 137-146) **Displacement due to radial forces on test samples of district heating pipes. A computerized calculation on influence of thickness and length of test samples on displacements in laboratory.** Adl-Zarrabi, B. (Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology). Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

Deformation due to thermal expansion reduces the thickness of the insulation material and thus the thermal resistance of the pipe in district heating systems. The work presented in this report concentrates on the influence of the length and thickness of test samples in laboratory experiments on polyurethane insulated district heating pipes exposed to forces applied radially. Calculations of deformation have been carried out by I-deas software which is based on the finite element method. The calculations show that the length of the test sample shall be at least 80 mm, below this level the deformation depends on the length of the test sample. A validity check of the computerized analysis has been made. A simple model has been tested and deformation have been measured and compared with the results of the computerized analysis. This comparison has shown that the results of the computerized analysis are 14% lower than the measured. This difference is probably due to the density variation of the polyurethane material over the cross section of the pipe

16073 (CTH-PUBL–93-8, pp. 147-152) **A test method for radial creep in DH-pipes.** Amby, L. (Danish Technological Institute, Aarhus (Germany). Dept. of Plastics Technology). Chalmers Univ. of Technology, Goeteborg (Sweden). Div. of Building Technology. [1993]. (CONF-9309477–: Nordic Seminar on CFC-free Insulation Techniques, Aarhus (Denmark), 6-7 Sep 1993). In *Proceedings of the Nordic Seminar on CFC-free Insulation Techniques.* 157p. Order Number DE95766686. Source: OSTI; NTIS.

The work made at the Danish Technological Institute is aimed at the development of a method to test radial creep behaviour in preinsulated district heating pipes. Basically the test involves full

scale preinsulated pipes. This means that finite size segments between service pipe and casing are physically loaded to enforce creep of the whole cross section of the preinsulated pipe. The creep behaviour has been studied in two types of cellular plastics materials, FEBIS I and FEBIS II under the following conditions: Service pipe temperatures: 90 and 110 and 130 and 150 degrees C; Radial load: 0.05 MPa, 0.15 MPa, 0.25 MPa and 0.35 MPa. Five parallel tests have been carried out under each combination of conditions with a test duration of 1000 hours. Furthermore, four reference tests have been established and are still in progress. 4 figs

16074 (DOE/ER–0313/16, pp. 419-427) **Fatigue Crack Growth Rate (FCGR) behavior of Nicalon/SiC composites.** Miriyala, N. (Univ. of Tennessee, Knoxville, TN (United States)); Liaw, P.K.; McHargue, C.J.; Snead, L.L.; Hsu, D.K.; Saini, V.K. Oak Ridge National Lab., TN (United States). Sep 1994. In *Fusion materials semiannual progress report for the period ending March 31, 1994.* 534p. Order Number DE95003404. Source: OSTI; NTIS; INIS; GPO Dep.

Ultrasonic measurements were carried out on the Nicalon/SiC composite specimens to correlate elastic moduli with percentage porosity in the in-plane as well as through-thickness directions. Compact type C(T) specimens were cyclically loaded to study the fatigue crack growth behavior. However, it was difficult to initiate the crack in the specimens.

16075 (FEI–2365) **Formation of helium voids of different form in neutron irradiated boron carbide and their stability under long isothermal annealings.** Shcherbak, V.I.; Tarasikov, V.P. Gosudarstvennyj Komitet po Ispol'zovaniyu Atomnoj Ehnergii SSSR, Obninsk (Russian Federation). Fiziko-Ehnergeticheskij Inst. 1994. 21p. (In Russian). Order Number DE95628644. Source: OSTI; NTIS (US Sales Only); INIS.

Tem observations of over pressured helium voids in neutron irradiated boron carbide after high-temperature annealing (1000 - 1600 deg C) are reported. The range of void shapes considered is from spheroids to thin disks and rods. An analysis of stresses arised because of differential or anisotropic swelling of grains in stabilization of different void shapes is presented. 16 refs., 3 figs., 1 tab.

The origin of chirality is closely related to the evolution of life on the Earth. Until now, no proposed mechanism has been able to explain how the completely asymmetric roles of mirror-image biological molecules could arise. Recently, Salam proposed that due to the attractive character of the parity violating force in electroweak interactions, a phase transition at low temperature could eventually lead to enantiomeric purity. Specific heat measurement is one of the powerful method to investigate the mechanism of second order phase transitions. A series of experimental tests has been undertaken and we have studied the differential specific heats of D and L Valine in single crystal state with sample mass being 100mg and 30mg respectively by differential scanning calorimetry in the temperature range 77-320K. Experimental data are presented on the temperature dependence of the specific heat in Figure. The specific heat jump at Tc 272K indicates the symmetry breaking of D-Valine. There is a smooth line of Cp-T(K) with L-Valine sample in the same temperature range. Furthermore, a specific heat peak at 272K has also been found with L-Valine as the reference sample and D-Valine. It seems to undergo a phase transition only in D-Valine. (author). 4 figs. Abstract only.

16077 (INIS-JP–028, pp. 30-32) **Irradiation effects of neutrons and electrons in semiconductors.** Kimura, Itsuro (Kyoto Univ. (Japan). Faculty of Engineering); Kanazawa, Satoshi; Kanno, Ikuo; Mikawa, Takumi; Ishihara, Shinji. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Silicon single crystal wafers were irradiated by 1 MeV electrons and by neutrons with different energy spectra. After irradiation, we measured the electrical resistivity and the concentration of defects in deep levels by the deep level transient spectroscopy (DLTS) and the isothermal capacitance transient spectroscopy (ICTS). Measured results are presented and compared each other. (author).

16078 (INIS-JP–028, pp. 80-81) **MeV ion induced damage production and accumulation in silicon.** Suzuki, Motoyuki (Kyoto Univ. (Japan). Faculty of Engineering); Okazaki, Makoto; Shin, Kazuo; Takagi, Ikuji; Yoshida, Koji. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Measurement and analysis were made for radiation damages in silicon induced by MeV ions. A single crystal silicon was bombarded by 800 keV O^+ and 700 keV Si^+ with the dose from $2x10^{15}$ up to $8x10^{15}$ cm^{-2}. And defects induced by the ion bombardments were observed by the channeling method. Some new modifications were made to the analysis of the channeling RBS spectrum so that the accuracy of the unfolded defect distribution may be improved. A new model of point-defect clustering and amorphous formation was proposed, which well reproduced the observed defect distribution in silicon. (author).

16079 (INIS-JP–028, pp. 103-105) **Irradiation effects of Ar cluster ion beams on Si substrates.** Ishii, Masahiro (Kyoto Univ. (Japan). Faculty of Engineering); Sugahara, Gaku; Takaoka, G.H.; Yamada, Isao. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

Gas-cluster ion beams can be applied to new surface modification techniques such as surface cleaning, low damage sputtering and shallow junction formation. The effects of energetic Ar cluster impacts on solid surface were studied for cluster energies of 10-30keV. Irradiation effects were studied by RBS. For Si(111) substrates, irradiated with $Ar_{\geq 500}$ clusters to a dose of $1x10^{15}$ ion/cm^2 at acceleration voltage 15kV, $2x10^{14}$ atoms/cm^2 implanted Ar atoms were detected. In this case, the energy per cluster atom was smaller than 30eV; at this energy, no significant implantation occurs in the case of monomer ions. Ar cluster implantation into Si substrates occurred due to the high energy density irradiation. (author).

16080 (INIS-JP–028, pp. 123-124) **Lattice defects in electron-irradiated $CoSi_2$ studied by positron-lifetime spectroscopy.** Ito, Yasushi (Kyoto Univ. (Japan). FZ Si single crystals were irradiated with 1MeV electron at 100-110K. We have investigated the recovery of defects in Si by positron-lifetime spectroscopy. Isochronal annealing study shows that negatively charged divacancies migrate at about 340K and form quadrivacancies, which are annealed out at about 700K. The positron lifetimes at divacancy and quadrivacancy are 340ps and 400ps, respectively. (author).

In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Angle-ply carbon/epoxy composites were irradiated in air with electron energy of 1.5MeV, resulting in total absorbed dose of 1000Mrad. Tensile and tension-tension fatigue tests (R=0.1) were carried out for both specimens in laboratory air. Special attention was paid to fracture processes : AE signal analyses during tests and non-destructive internal damage evaluation with a scanning acoustic microscope were performed ; fracture surfaces were closely examined with a scanning electron microscope. (author).

Source: OSTI; NTIS (US Sales Only); INIS.

Ferromagnetic resonance was used to obtain information on some properties of amorphous ferromagnetic materials, prepared by rapid quenching of the melt, after neutron irradiation. The effective polarization J_{ef} and the g-factor do not change in the amorphous alloys $Fe_{30}Ni_{48-x}Cr_xMo_2Si_5B_{15}$ ($x<4$) if the neutron flow is less than 1.10^{19} neutron.cm^{-2}. An increase in chromium content ($x>4$) results in a rapid decrease of these physical quantities - the g-factor and J_{ef} - with increasing neutron flow. (author) 3 figs., 6 refs.

16085 (IS-M–815) **A numerical analysis of fracture and high temperature creep characteristics of composites with discontinuous ductile reinforcements.** Biner, S.B. Ames Lab., IA (United States). [1994]. 6p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-941144–123: 1994 fall meeting of the Materials Research Society (MRS), Boston, MA (United States), 28 Nov - 2 dec 1994). Order Number DE95010236. Source: OSTI; NTIS; GPO Dep.

Role of material parameters on fracture and creep behavior of discontinuous ductile fiber reinforced brittle matrix composite system was numerically investigated. For simulation of fracture behavior, the ductile fibers were modeled using a constitutive relationship that accounts for strength degradation resulting from nucleation and growth of the voids. The matrix is assumed to be elastic and fails according to requirements of a stress criterion. Results indicate that the contribution of ductile reinforcement to the work of fracture value (toughness) of the composite increases with less exhaustion of its work hardening capacity before the onset of matrix failure. At creep regime, for rigidly bonded interfaces, the creep rate of the composite is not significantly influenced by the material properties of the ductile reinforcing phase due to development of large hydrostatic stress and constrained deformation in the reinforcement. Significant increases in room temperature fracture toughness can be achieved without extensively sacrificing the creep strength by ductile discontinuous reinforcements.

16086 (IS-T–1716) **Room temperature fracture and high temperature creep deformation properties of alumina reinforced with 20 vol % particulate niobium.** Lane, S. Ames Lab., IA (United States). 20 Oct 1994. 98p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-82. Order Number DE95010234. Source: OSTI; NTIS; GPO Dep.

For this material, an increase in RT crack growth resistance of $\geq$ 300% was achieved; this property increases with increasing Nb particle size. SEM and in-situ crack growth observations show that crack bridging is the primary toughening mechanism for the increased crack growth resistance. A model was presented which uses existing models to determine the steady state bridging length given a stress intensity due to crack bridging. This model showed that the specimen size used for determining the RT fracture toughness was too small. It was also determined that the creep strain rate is in the same range as and comparable to existing studies of Al_2O_3 and Al_2O_3 systems. The creep mechanism of the composite material was found to be similar to that of unreinforced Al_2O_3 with a stress redistribution to the particle/matrix interface.

Submitted to Nuclear Tracks and Radiation Measurements.

The surfaces of boron doped synthetic and natural diamonds have been investigated by scanning tunneling (STM) and electronic microscopy (SEM) before and after irradiation with ^{40}Ar (25 MeV), ^{84}Kr (210 MeV), ^{129}Xe (124 MeV) ions. The structures observed (STM) after irradiation showed craters ranging from 3 nm to 20 nm in diameters, which are deduced to be single ion tracks and multiple hits of ions at the nearest positions of the surface. In the case of argon ion irradiation the surface was very amorphous, but after xenon irradiation one could see parts of surface without amorphism. The phenomenological model of ion track formation is discussed. The energy and temperature criteria when crater formation under the heavy ion irradiation will take place are introduced. 17 refs., 3 figs.

16112 (LA-UR–95-654) **Hydrostatic extrusion of BSCCO/Ag composite wire.** Bingert, J.F.; Bingham, B.L.; Sebring, R.J.; Kelly, A.M. Los Alamos National Lab., NM (United States). [1995]. 11p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-36. (CONF-950201–9: Annual meeting and exhibition of the Minerals, Metals and Materials Society (TMS), Las Vegas, NV (United States), 12-16 Feb 1995). Order Number DE95007862. Source: OSTI; NTIS; GPO Dep.

The application of hydrostatic extrusion processing to composite wire fabrication offers several advantages over conventional reduction techniques. These include enhanced uniformity, increased reduction capability, and successful extrusion of normally brittle materials. Specifically, this work involved an experiment to screen the effects of seven extrusion process parameters on the uniformity and density of as-extruded BSCCO-core wire, and the required extrusion pressure. Results suggest the following factors to be potentially significant: (1) back pressure, extrusion ratio, and die angle on core uniformity, (2) packing method, extrusion ratio, silver

powder additions, and temperature on density, and (3) extrusion ratio and temperature on extrusion pressure.

16113 (SAND–94-2298C) **Dynamic brittle material response based on a continuum damage model.** Chen, E.P. Sandia National Labs., Albuquerque, NM (United States). [1994]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950686–1: Joint applied mechanics and materials summer meeting, Los Angeles, CA (United States), 28-30 Jun 1995). Order Number DE95006306. Source: OSTI; NTIS; GPO Dep.

The response of brittle materials to dynamic loads was studied in this investigation based on a continuum damage model. Damage mechanism was selected to be interaction and growth of subscale cracks. Briefly, the cracks are activated by bulk tension and the density of activated cracks are described by a Weibull statistical distribution. The moduli of a cracked solid derived by Budiansky and O'Connell are then used to represent the global material degradation due to subscale cracking. This continuum damage model was originally developed to study rock fragmentation and was modified in the present study to improve on the post-limit structural response. The model was implemented into a transient dynamic explicit finite element code PRONTO 2D and then used for a numerical study involving the sudden stretching of a plate with a centrally located hole. Numerical results characterizing the dynamic responses of the material were presented. The effect of damage on dynamic material behavior was discussed.

16114 (SAND–94-3247C) **Formation of cavities in Si and their chemisorption of metals.** Follstaedt, D.M.; Myers, S.M. Sandia National Labs., Albuquerque, NM (United States). [1994]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-9503125–1: 9. international conference on microscopy of semiconducting materials, Oxford (United Kingdom), 20-23 Mar 1995). Order Number DE95009586. Source: OSTI; NTIS; INIS; GPO Dep.

Nanometer-size cavities formed in Si by He^+ implantation and annealing are examined with cross-section TEM. During annealing at 700 C or above, He degasses from the specimens, leaving uhv cavities with reactive Si bonds on their walls. Cavity microstructures have been characterized in detail for an implanted fluence of 1×10^{17} He/cm^2: cavity volume remains approximately constant (0.75 lattice sites/He) for anneals from 700 to ~1000 C, while surface area (3 to 7 times the wafer area) decreases with temperature as the cavities coarsen. The cavities are found to getter up to ~1 monolayer of Cu or Au from solution in Si without second-phase formation, thus identifying the trapping mechanism as chemisorption on the cavity walls.

16115 (SAND–95-0351C) **Models for predicting damage evolution in metal matrix composites subjected to cyclic loading.** Allen, D.H. (Texas A and M Univ., College Station, TX (United States). Center for Mechanics of Composites); Hurtado, L.D.; Helms, K.L.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by Department of Defense, Washington, DC (United States). DOE Contract AC04-94AL85000. Grant F49620-94-1-0341. (CONF-950788–6: International conference on computational engineering science, Mauna Lani, HI (United States), 30 Jul - 3 aug 1995). Order Number DE95007734. Source: OSTI; NTIS; GPO Dep.

A thermomechanical analysis of a continuous fiber metal matrix composite (MMC) subjected to cyclic loading is performed herein. The analysis includes the effects of processing induced residual thermal stresses, matrix inelasticity, and interface cracking. Due to these complexities, the analysis is performed computationally using the finite element method. Matrix inelasticity is modelled with a rate dependent viscoplasticity model. Interface fracture is modelled by the use of a nonlinear interface constitutive model. The problem formulation is summarized, and results are given for a four-ply unidirectional SCS-6/β21S titanium composite under high temperature isothermal mechanical fatigue. Results indicate rate dependent viscoplasticity can be a significant mechanism for dissipating the energy available for damage propagation, thus contributing to improved ductility of the composite. Results also indicate that the model may be useful for inclusion in life prediction methodologies for MMC's.

16116 (SAND–95-0379C) **High strain rate properties and constitutive modeling of glass.** Holmquist, T.J. (Alliant Techsystems Inc., Hopkins, MN (United States)); Johnson, G.R.; Lopatin, C.M.; Grady, D.E.; Hertel, E.S. Jr. Sandia National Labs., Albuquerque, NM (United States). [1995]. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950537–2: 15. international symposium on ballistics, Haifa (Israel), 21-24 May 1995). Order Number DE95008434. Source: OSTI; NTIS; GPO Dep.

This paper presents experimental data and computational modeling for a well-defined glass material. The experimental data cover a wide range of strains, strain rates, and pressures that are obtained from quasi-static compression and tension tests, split Hopkinson pressure bar compression tests, explosively driven flyer plate impact tests, and depth of penetration ballistic tests. The test data are used to obtain constitutive model constants for the improved Johnson-Holmquist (JH-2) brittle material model. The model and constants are then used to perform computations of the various tests.

16117 (SAND–95-0583C) **Models of transport, gas-phase and surface chemistry in diamond chemical vapor deposition.** Dandy, D.S. (Colorado State Univ., Fort Collins, CO (United States). Dept. of Chemical Engineering); Coltrin, M.E. Sandia National Labs., Albuquerque, NM (United States). [1995]. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950518–4: 187. meeting of the Electrochemical Society, Reno, NV (United States), 21-26 May 1995). Order Number DE95009861. Source: OSTI; NTIS; GPO Dep.

This paper presents an analysis of the Chemical Vapor Deposition of diamond thin films in a direct-current (dc) arc-jet reactor. The analysis discussed here includes a model of the performance of the arc-jet hydrogen excitation source, chemistry in the free-stream region, diffusive transport and chemistry in the boundary layer and at the surface. The surface chemistry model includes pathways for deposition of diamond, as well as creation of defects in the diamond lattice.

16118 (SAND–95-0664C) **GCMS and FTIR studies of by-product inhibited growth and the rate-limiting step in TEOS-based SiO_2 CVD.** Bartram, M.E. (Sandia National Labs., Albuquerque, NM (United States). Chemical Processing Science Dept.); Moffat, H.K. Sandia National Labs., Albuquerque, NM (United States). [1995]. 8p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC04-94AL85000. (CONF-950518–3: 187. meeting of the Electrochemical Society, Reno, NV (United States), 21-26 May 1995). Order Number DE95009863. Source: OSTI; NTIS; GPO Dep.

To improve process reliability and deposition methods, it is essential to identify the rate-limiting step in TEOS-based SiO_2 CVD and its dependence on process conditions. For this purpose, experiments designed to evaluate by-product inhibition effects and to identify the rate-limiting step in TEOS decomposition have been carried out in a research reactor using GCMS and FTIR. By repetitively sampling a series of reactions in which TEOS was first mixed with ethylene, ethanol, and water in the gas-phase, GCMS was used to show clearly that these reaction by-products do not inhibit the heterogeneous reaction step on SiO_2 at 1,000K. FTIR was used to determine that ethoxy groups from TEOS dissociative chemisorption have a significant lifetime on the SiO_2 surface at CVD temperatures and have an activation energy for decomposition of 16kcal/mol$\pm$4kcal/mol. This is much higher than the activation energy of 6 kcal/mol reported for the initial chemisorption step and is near the 22 kcal/mol reported for the overall activation energy for SiO_2 deposition in a cold-wall reactor. These results suggest that, whether or not surface ethoxy groups inhibit TEOS reactions, their decomposition may be directly related to the rate-limiting step in SiO_2 deposition.

16119 (SBI-MEDD–107) **Glass in the building envelope - a review.** Munch-Andersen, J.; Ellum, J.C. Statens Byggeforskningsinstitut, Hoersholm (Denmark). 1995. 56p. (In Danish). Contract ENS-1213/93-0023. Order Number DE95772419. Source: OSTI; NTIS.

EFP-93.

Glass is increasingly used in the building envelope, also in solar walls and glass roofs, to make use of solar radiation. The document reviews the existing knowledge of the design of glass in the building envelope. It deals with the description of the strength of glass, the strength degradation as function of the load history, the statistical description of the strength of a glass pane, the determination of stresses and strains, the necessary knowledge of loads needed to account for the strength degradation and the calculation of failure probability. The coupling effect of multi-layered glass panes (laminated glass or insulating glazing), thermal stresses, safety glazing and fire precautions is discussed. Glass structures must be designed for the entire load history, but only the larger values and their duration need to be considered for practical purposes. Lack of knowledge concerning parameter values might an explanation for the severe discrepancy between the theoretical knowledge and the design used. Assuming that ordinary, vertical glass panes subjected only to wind load and designed according to current rules is designed satisfactory in such a way that the safety level through experience has proved to be satisfactory, it is possible to obtain design rules for instance for glass roofs with the same level of safety. It is shown that it is likely that the load duration can be taken into account by means of simple factors applied to the code loads, and that the load combinations could be very simple. (AB) (74 refs.)

16120 (SKB-TR–94-25) **Kinetic modelling of bentonite-canister interaction. Long-term predictions of copper canister corrosion under oxic and anoxic conditions.** Wersin, P. (MBT Tecnologia Ambiental, Cerdanyola (Spain)); Spahiu, K.; Bruno, J. Swedish Nuclear Fuel and Waste Management Co., Stockholm (Sweden). Sep 1994. 38p. Order Number DE95626491. Source: OSTI; NTIS; INIS.

A new modelling approach for canister corrosion which emphasises chemical processes and diffusion at the bentonite-canister interface is presented. From the geochemical boundary conditions corrosion rates for both an anoxic case and an oxic case are derived and uncertainties thereof are estimated via sensitivity analyses. Time scales of corrosion are assessed by including calculations of the evolution of redox potential in the near field and pitting corrosion. This indicates realistic corrosion depths in the range of 10^{-7} and $4*10^{-5}$ mm/yr, respectively for anoxic and oxic corrosion. Taking conservative estimates, depths are increased by a factor of about 200 for both cases. From these predictions it is suggested that copper canister corrosion does not constitute a problem for repository safety, although certain factors such as temperature and radiolysis have not been explicitly included. The possible effect of bacterial processes on corrosion should be further investigated as it might enhance locally the described redox process. 35 refs, 11 figs, 6 tabs.

16121 (UCRL-JC–115700) **Metallic laminates for engine applications.** Lesuer, D.R.; Syn, C.K. Lawrence Livermore National Lab., CA (United States). Jun 1994. 14p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-940641–2: 8. world ceramic congress, Florence (Italy), 29 Jun - 4 jul 1994). Order Number DE95010259. Source: OSTI; NTIS; GPO Dep.

Laminated metal composites consist of alternating metal (or metal matrix composite) layers that are bonded together. This paper reviews the processing of these materials and the properties relevant to engine applications. These properties include strength, toughness and damping capacity. Laminates can have very attractive properties relative to other structural materials for weight critical applications requiring high stiffness, strength and fracture toughness. The structure-property correlations that determine these properties are described.

16122 (UCRL-JC–118417) **Simulation of fracture in compression using a field-theory model.** Blair, S.C. (Lawrence Livermore National Lab., CA (United States)); Cook, N.G.W. Lawrence Livermore National Lab., CA (United States). 23 Feb 1995. 7p. Sponsored by USDOE, Washington, DC (United States). DOE Contract W-7405-ENG-48. (CONF-950655–6: 35. US symposium on rock mechanics, South Lake Tahoe, NV (United States), 4-7 Jun 1995). Order Number DE95009874. Source: OSTI; NTIS; GPO Dep.

Compressive fracture in rock is simulated and analyzed in terms of crack patterns and crack strain energy. Results indicate that initially cracks are randomly located and non-interesting. When ~10% of the sites are cracked, crack interaction becomes important and cluster of cracked sites form and extend. Finally, a few critical connecting cracks form and link the clusters to cause failure.

This project focuses on improvement of radioanalytical methods, with an emphasis on faster and cheaper routine methods. The authors have developed improved methods for the separation of environmental levels of technetium-99, radium, and actinides from soil and water; separation of actinides from soil and water matrix interferences; and isolation of strontium. Among the novel techniques for separation that are being used are element and class-specific resins and membranes. The authors have also developed methods for the simultaneous detection of multiple isotopes by using inductively coupled plasma-mass spectrometry (ICP-MS). Because of its mass-selective mode of detection, ICP-MS requires less rigorous chemical separations than does radiochemical analysis. In addition, improvements in the limits of detection, the volume of the sample and the time of analysis were obtained by using other techniques of sample introduction, such as ultrasonic nebulization, automated batch separation and electrothermal vaporization. Investigation of integration and automation of the separation methods with the ICP-MS method using flow injection analysis is underway. A solid scintillation device has been developed and tested for measurement and identification of low-energy beta-emitting radionuclides; application of this technique will eliminate the generation of mixed-waste counting cocktails. The final product of all activities will be methods that are available and are acceptable for use in regulatory situations. Concerted efforts are being made to facilitate implementation of the methods at DOE sites to realize the improvements offered.

16124 (BARC–1994/E/025) **Preparation of carbonaceous electrodes and evaluation of their performance by electrochemical techniques.** Sharma, H.S. (Bhabha Atomic Research Centre, Bombay (India). Fuel Chemistry Div.); Manolkar, R.B.; Kamat, J.V.; Marathe, S.G.; Biswas, A.R.; Kulkarni, P.G. Bhabha Atomic Research Centre, Bombay (India). 1994. 40p. Order Number DE95627533. Source: OSTI; NTIS (US Sales Only); INIS.

Carbonaceous electrodes, from glassy carbon (GC), graphite rod or graphite powder, have been prepared for coulometric and voltammetric investigation. Beaker type graphite electrode of larger surface area was used as working electrode for the analysis of uranium and plutonium in solution by coulometry. Results have shown usefulness of the electrode for both uranium and plutonium analysis. Thus the graphite electrode can be used in place of mercury for uranium analysis and in place of platinum gauze for plutonium analysis. GC electrode (from French and Indian material), graphite or carbon paste electrode of smaller surface area prepared here have also been found to give satisfactory performance as could be observed from cyclic voltammetric (cv) patterns for standard $K_3Fe(CN)_6/K_4Fe(CN)_6$ redox system. Especially the GC electrode, (French) polished to 1μ finish with diamond paste gave very low values (1μ amp.) of background current in 1M KCl and the difference in cathodic and anodic peak potentials (δE values)

was close to 60 mV from one electron transfer. Therefore the electrode can be used for various types of electrochemical studies relating to redox potentials, reaction mechanism, kinetic parameters etc. of different electrode processes. (author). 20 refs., 3 tabs., 10 figs., 8 photographs.

16125 (BARC–1994/E/029) **An ICP-AES method for the determination of trace metals in uranium by solvent extraction using KSM-17.** Jacob, Mary (Bhabha Atomic Research Centre, Bombay (India). Fuel Reprocessing Division); Radhakrishnan, K.; Dhami, P.S.; Kulkarni, V.T.; Joshi, M.V.; Patwardhan, A.B.; Ramanujam, A.; Mathur, J.N. Bhabha Atomic Research Centre, Bombay (India). 1994. 18p. Order Number DE95627534. Source: OSTI; NTIS (US Sales Only); INIS.

This paper describes the studies carried out for the determination of trace metallic impurities in uranium solutions. Uranium matrix is separated from the impurity elements by its selective extraction using 2-ethylhexyl hydrogen 2-ethylhexyl phosphonate (KSM-17, equivalent to PC88A). The aqueous phase is analysed for trace impurities by inductively coupled argon plasma atomic emission spectrometry. The studies also include recovery of impurities at various acidities and spectral interferences of uranium over the analyte element channels. Based on the above studies, a method has been standardised for the analysis of nineteen elements in uranium solutions. The relative standard deviation of the method for various elements is in the range of +- 1-5%. (author). 7 refs., 8 tabs., 1 fig.

16126 (BNL–61149, pp. 82-104) **Surface-sensitive analysis of materials used in the production of PET radioisotopes.** Alvord, B. (CTI, Inc., Knoxville, TN (United States)). Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The use of computer operated cyclotrons for clinical production of radiotracers for PET has made data on target performance (observed by a variety of users and with large statistics) recently available. The issues of consistent fluoride ion yields and repeatable FDG synthesis yields are of singular importance to the ordinary clinical user. For widespread manufacturing of compounds like FDG, it will be essential to have any issues affecting yield well understood. Much work has been done on water targets looking at the effect on yield of impurities in target water (before and after irradiation), dose rate, synthesis setup, overpressures, and cooling conditions. It is in this environment that the authors have begun to look at the surface chemistry of target body and window materials in order to better understand the mechanisms of target performance and lifetime. Ample anecdotal evidence exists for phenomena of "burn in," slow or rapid deterioration due to contaminants in target water, and the required target rebuild or cleaning procedure for best yields. However quantitative methods for understanding the same phenomena are few. One of the most commonly used diagnostic tools for target failure analysis to date has been simple visual inspection of the windows and target body during target rebuilding. One can get a good idea of beam hot spots, contamination in helium recirculation systems, and accumulation of unwanted material in the beam strike. However, the color and finish of a deposit is subject to interpretation, and yields no chemical information or thickness of deposit. More quantitative methods exist. The work here focusing on the use of ESCA for target surface analysis.

16127 (BNL–61149, pp. 121-125) **Recovery of enriched stable isotopes in radionuclide production.** Razbash, A.A. (Cyclotron Co. Ltd., Obninsk (Russian Federation)); Sevastyanov, Yu.G.; Polyakov, O.N.; Krasnov, N.N.; Konyakhin, N.A.; Tolstouhov, Yu.V.; Maklachkov, A.G. Brookhaven National Lab., Upton, NY (United States). 1994. (CONF-9309170–: 5. international workshop on targetry and target chemistry, Upton, NY (United States), 19-23 Sep 1993). In *Proceedings of the Fifth International Workshop on Targetry and Target Chemistry.* 392p. Order Number DE95006634. Source: OSTI; NTIS; GPO Dep.

The wide application of radionuclides in different fields of science and industry demanded an increase of their production. One of the ways to increase the radionuclide production on present cyclotrons is the use of the targets from enriched stable isotopes. This allows one to raise the productivity in some cases by two or more times and to increase radionuclidic purity. It should be noted, however, that enriched stable isotopes are very expensive. Therefore it is advisable to use such raw materials more than once. In the last ten years, The authors have used stable isotopes extensively for making of targets. Zinc-67 and zinc-68, cadmium-111 and cadmium-112, nickel-58, silver-109, thallium-203 have been employed for the production of gallium-67, indium-111, cobalt-57, cadmium-109 and thallium-201, respectively. The technique for the recovery of enriched stable isotopes has been developed. In this report the schemes of the recovering processes are presented.

16128 (CONF-950226–36) **Ultrasensitive fluorescence detection and photophysics in microdroplets.** Barnes, M.D.; Whitten, W.B.; Ramsey, J.M. Oak Ridge National Lab., TN (United States). [1995]. 10p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC05-84OR21400. From SPIE '95: SPIE conference on optics, electro-optics, and laser application in science, engineering and medicine; San Jose, CA (United States); 5-10 Feb 1995. Order Number DE95010283. Source: OSTI; NTIS; GPO Dep.

Fluorescence detection of single molecules in room temperature liquids is usually plagued by many difficulties such as finite saturated absorption rate, finite laser-analyte interaction time, and analyte diffusion. Our approach to single molecule detection in liquids has been to use microdroplets as the sample medium which has many advantages over conventional "bulk" techniques such as extended laser-analyte interaction time, a probe volume defined by the droplet, and modified radiative properties of molecules due to interactions with droplet resonances. We have demonstrated detection of single rhodamine molecules with signal-to-noise ratios on the order of 30 using levitated microdroplets as the sample medium. The focus of current work is on single molecule detection in falling droplet streams with analysis rates on the order of 5–10 kHz.

16129 (DOE/ER/45233–10) **Application of spin-sensitive electron spectroscopies to investigations of electronic and magnetic properties of solid surfaces and epitaxial systems.** Walters, G.K.; Dunning, F.B. Rice Univ., Houston, TX (United States). Feb 1995. 13p. Sponsored by USDOE, Washington, DC (United States). DOE Contract FG05-86ER45233. Order Number DE95010154. Source: OSTI; NTIS; GPO Dep.

The principal objectives of the research have been improved understanding and characterization of electronic and magnetic properties of surfaces, adsorbates and epitaxially-grown systems. Toward this end, substantial effort has also been directed toward better elucidation of the dynamical processes involved in electron-surface and atom-surface interactions, since these provide the bases for electron spectroscopies commonly used for probing surface properties. To accomplish these objectives, three novel spin-sensitive electron spectroscopies have been developed in this laboratory, and these have been exploited to provide new information not accessible using the corresponding conventional (non-spin-sensitive) spectroscopies. These spectroscopies and the new knowledge that has resulted from their application are discussed briefly in the following three sections of the report: spin polarized low energy electron diffraction (SPLEED); spin polarized electron energy loss spectroscopy (SPEELS); and spin polarized (metastable atom) deexcitation spectroscopy (SPMDS).

16130 (HW–41397-Ch.3) **Nuclear metallurgy lectures. Chapter 3.** Evans, T.W. Hanford Works, Richland, WA (United States). 18 May 1956. 31p. Sponsored by USDOE, Washington, DC (United States). DOE Contract AC06-76RL01830. Order Number DE95010023. Source: OSTI; NTIS; GPO Dep.

This lecture gives an understanding of what can be learned about the structure of metallic materials by the use of x-ray diffraction (XRD) methods. After reviewing the principles of XRD by crystals, the lecture discusses structure determinations, preferred orientation and its measurement, and line broadening and its measurement with emphasis on problems pertaining to reactor application of metals.

16137 (INIS-BR–3500) **Measurement of the ^{235}U absolute activity.** Bueno, C.C.; Santos, M.D.S. Pontificia Univ. Catolica de Sao Paulo, SP (Brazil). Dept. de Fisica. 1993. 11p. (CONF-9312106–: Symposium on Experimental Techniques in Physics, Sao Paulo (Brazil), 10-11 Dec 1993). Order Number DE95627521. Source: OSTI; NTIS (US Sales Only); INIS.

The absolute activity of ^{235}U contained in a sample was measured utilizing a sum-coincidence circuit which selects only the alpha particles emitted simultaneously with the 143 KeV gamma radiations from the ^{231}Th (product nucleus). The alpha particles were detected by means of a new type of a gas scintillating chamber, in which the light emitted by excitation of the gas atoms, due to the passage of a charged incoming particle, has its intensity increased by the action of an applied electric field. The gamma radiations were detected by means of a 1'x $1^{1/2}$ NaI (Tl) scintillation detector. The value obtained for the half-life of ^{235}U, $(7.04+-0.01)10^{8}$ y, was compared with the data available from various observers with used different experimental techniques. It is shown that our results are in excellent agreement with the best data available on the subject. (author) 15 refs, 5 figs, 1 tab.

16138 (INIS-BR–3501) **On the use of thin natural uranium film dosimetry in mineral dating by the fission track method.** Hadler Neto, J.C. (Universidade Estadual de Campinas, SP (Brazil)); Iunes, P.J.; Khouri, M.C. Sociedade Brasileira de Geofisica, Rio de Janeiro, RJ (Brazil). 1993. 7p. (CONF-9311307–: 3. International Congress of the Brazilian Geophysical Society, Rio de Janeiro (Brazil), 7-11 Nov 1993). Order Number DE95627522. Source: OSTI; NTIS (US Sales Only); INIS.

Three obsidian samples were irradiated in a neutron facility and their age was measured by the fission track method; using a thin uranium film dosemeter. The results were compared to others made previously on the same type of rock using conventional neutron dosimetry. The use of thin uranium film for age determination is discussed. (F.E.). 20 refs, 4 tabs.

16139 (INIS-JP–028, pp. 38-39) **PIXE analysis for trace-elements in dust-particles.** Tazawa, Yuji (Kyoto Univ. (Japan). Dept. of Physics); Ogino, Koya. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1993. 156p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Faculty of Engineering, Kyoto University.* Order Number DE95709897. Source: OSTI; NTIS; INIS.

PIXE analysis have been performed to study for trace-elements in dust-particles such as meteorite fragments using with Tandem-Vande-Graaf accelerator. X-ray spectra obtained PIXE method were compared to find better analytical conditions for dust-particles and powdered milks under the various conditions of ion beam, absorbers and target preparation. (author).

16140 (INIS-JP–029, pp. 140-142) **Chemical characteristics of rain-water.** Kasahara, Mikio (Kyoto Univ., Uji (Japan). Inst. of Atomic Energy); Ogiwara, Hiroshi; Park, Jeong-Ho; Takahashi, Kanji. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Rain drops were collected every 0.1mm precipitation. Rain water was passed through a Nuclepore filter with 0.2μm pore-size. Chemical species in the filtrate and the residue are defined as a soluble and an insoluble component, respectively. Dry PIXE samples from filtrate were prepared bydropping and evaporating successively ten 20μ l drops with a micropipet onto a non-hole thin film. The drops were dried in a spot-like of 4mmϕ such that all of the samples were bombarded by 6mmϕ ion beam. Elemental concentrations were determined with 2.0 MeV H^{+} beam from a Tandem accelerator. X-rays with 0.5-14.8keV energy were detected by a Si(Li) detector after passing through a 39.3μm thick Maylar absorber. The concentrations of all analyzed 15 elements in both insoluble and soluble components decreased rapidly from the beginning of rain to the amount of 0.3mm rain fall as well asban electrical conductivity. Most of Si and Fe were insoluble, on the other hand, most of S and Cl were soluble. (author).

16141 (INIS-JP–029, pp. 143-144) **Determination of trace elements in wood.** Nishimura, Kazuo (Kyoto Univ. (Japan). Faculty of Agriculture); Katayama, Yukio. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

NBS Orchard leaves and cellulose powder were used to normalize the analytical data, obtained from PIXE analysis, for wood samples collected at different sampling sites. Appropriate amount of heavy metals solution were added to cellulose powder to make 5, 10, 15 and 20 μg/g content. Peak count per unit element added in cellulose powder were relatively lower in Fe, Zn, Sb and As. Because, chloride form of Fe and Zn have higher volatility than sulfate and phosphate salts. Sb and As were activated by ion beam. Thus, these element may evaporate under vacuum condition. (author).

16142 (INIS-JP–029, pp. 145-146) **Increased aluminum content in the spinal cord of amyotrophic lateral sclerosis and Parkinsonism-dementia of Guam and in the Kii Peninsula of Japan.** Wakayama, Ikuro (Wakayama Medical Coll. (Japan)); Yoshida, Sohei; Sasajima, Kazuhisa; Takada, Jitsuya; Yoshida, Koichi. Kyoto Univ. (Japan). Faculty of Engineering. Jul 1994. 163p. (In Japanese). In *Annual report of Radiation Laboratory Department of Nuclear Engineering Kyoto University for fiscal 1993.* Order Number DE95709896. Source: OSTI; NTIS; INIS.

Aluminum content in the lumbar spinal cord of patients with amyotrophic lateral sclerosis(ALS) and Parkinsonism-dementia(PD) in the Kii Peninsula of Japan and in the island of Guam was measured using a particle induced X-ray emission analysis. We demonstrated that aluminum content was increased in the spinal cord of patients with ALS in two foci of the western Pacific, indicating aluminum to be a important factor in the process of spinal motor neuron degeneration. (author).

16143 (INIS-mf–14483, pp. 111-116) **Study of Mars surface using Moessbauer spectroscopy.** Lipka, J. (STU, Bratislava (Slovakia). (CONF-9308262–: 11. conference of Czech and Slovak physicists, Zilina (Slovakia), 30 Aug - 3 sep 1993). In *Proceedings of the 11. conference of Czech and Slovak physicists.* Order Number DE95626244. Source: OSTI; NTIS (US Sales Only); INIS.

Discussed is the potential of Moessbauer spectroscopy in the planned space program which will be concerned with on-site examination of iron compounds on the planet Mars. Attention is paid to the scanning of spectra in the transmission and reflection modes. The following 2 problems must be addressed to obtain good quantitative results: (i) the time of Moessbauer spectra measurement in the reflection mode, which is nearly one order of magnitude longer than in the transmission mode, and (ii) complications in the reflection mode which are associated with the variable thickness of the samples, whose surface does not lend itself to treatment. (Z.S.). 2 tabs., 2 figs., 5 refs.

16148 (INIS-mf–14528) **Intercomparison measurements of surface soil contamination with in-situ gamma ray spectrometry. Pt.2. Natural radionuclides.** Winkelmann, I. Bundesamt fuer Strahlenschutz, Berlin (Germany). Fachbereich Strahlenschutz. 1994. 20p. (In German). (CONF-9410338–: Environmental Radioactivity: national seminar with international participation, Sofia (Bulgaria), 11-13 Oct 1994). Order Number DE95627523. Source: OSTI; NTIS (US Sales Only); INIS.

The intercomparison program was performed by the Federal Office of Radiation Protection in October 1993. 17 teams - 10 from Germany and 7 from other european countries - took part in the measurements. Three characteristic sites at the Ronneburg (Wismut Ltd.) Uranium Mine facility are investigated: Absetzerhalde, Parkplatz Drosen and Gessenhalde. The specific activity of the nuclides from U-Ra- and Th-series and of ^{40}K was measured at 5 locations. Most of the participants reported data about all nuclides from these decay chains measured by gamma ray spectrometry. Basically, the measured data were in good agreement and, as expected, the radionuclides from Th-series agreed better than those from U-Ra-series. Some participants reported significantly higher values (compared to the total mean value) for ^{226}Ra (up to 90%). For other nuclides the deviations from the total mean value are within the measurement's uncertainty. The following specific activities are obtained: (1) For Absetzerhalde site: ^{238}U (^{226}Ra) - 1900 Bq/kg (1600 Bq/kg); ^{232}Th - 40 Bq/kg; ^{40}K - 640 Bq/kg. (2) For Parkplatz Drosen site: ^{238}U (^{226}Ra) - 700 Bq/kg (600 Bq/kg); ^{232}Th - 20 Bq/kg; ^{40}K - 460 Bq/kg. (3) For Gessenhalde site: ^{238}U

(^{226}Ra) - 1200 Bq/kg (1800 Bq/kg); ^{232}Th - 30 Bq/kg; ^{40}K - 430 Bq/kg. 10 tabs., 14 figs., 3 refs. (orig.).

Objective is a field, on-line high resolution spectrometer system capable of resolving the optical emission from actinide isotopes in an inductively coupled plasma. AOTF (acousto-optic tunable filter) and FFP (fiber optic Fabry-Perot) were combined in this spectrometer, using bulk optical materials. The AOTF-FFP system was tested on U-235/U-238 and RCRA metals. Future development is described; a commercialization plan is attached.

The detection of light and medium heavy elements in not homogeneous solids is a severe problem in ion beam analysis. Heavy elements can be detected by the well established Rutherford backscattering technique (RBS). In a homogeneous host material most impurities can be easily analyzed by secondary ion mass spectroscopy (SIMS). Some isotopes (^{3}He, ^{6}Li, ^{10}B) can be measured by nuclear reaction analysis (NRA) using thermal neutrons inducing (n, p) or (n, α) reactions. Others can be detected by energetic ion beams by nuclear reactions (e.g. ^{15}N(^{1}H, $\alpha\gamma$)^{12}C for analysis of hydrogen). A high content of H, D or T can be also determined by elastic recoil detection using an energetic He beam. The latter technique has been developed to a universal method for detection of light and heavy elements in any target, using a high energetic heavy ion beam and a detector system, which is able to identify the recoils and delivers energy and position of the particles. Accepted by Organizing Committee of the Third International Conference on Methods and Applications of Radioanalytical Chemistry, Hawaii, Apr 10-16, 1994.

Experience in the application of radioanalytical methods, including NAA, at the IBR-2 pulsed fast reactor is reviewed. Details of the instruments dedicated to neutron activation analysis and radiography studies are reported. Applications of resonance neutrons to environmental monitoring and to the investigation of high-purity materials, are examplified. 15 refs. 9 figs., 9 tabs.

The content of micro impurities in super clean aluminium obtained by the melting zone method was determined by activation analysis at the IBR-2 reactor at the FLNP. Nearly of 25 elements were determined with their concentrations as lying within the 10^{-4}-10^{-9} weight %. Estimates of cleaning degree for impurity elements within the 1 up to 10^{4} have been obtained. 1 ref., 4 tabs.

A method of determining subpicogram quantities of plutonium in soil, mud, water, plant and animal tissues is proposed. Plutonium is chemically isolated from the specimens, while the α-active ^{236}Pu is used to control the yield, and irradiated by thermal neutrons. The number of fission acts ^{239}Pu determined by solid state track detectors (SSTD). To control possible uranium impurities in the plutonium fraction, the latter and standard (in contact with fresh SSTD) are bombarded by high fluence of γ-quanta with energies $\leq$ 25 MeV (microtron Bremsstrahlung). We have succeeded in determining the lower limit of ^{235}U impurities at a level of $< 10^{-13}$ g, due to similar photofission cross section of all U and Pu isotopes. The proposed method provides the determination of ^{239}Pu content in regular analyses with a sensitivity at a level of 10^{-13} g/g. More than one hundred assays for ^{239}Pu content in specimens of above indicated media from Ukraine, Belarus, Ural region and Germany have been performed. (author). 13 refs., 1 fig., 1 tab.
